Time to peak, serum: 2-2.5 hours

Excretion: Feces (as glucuronide conjugates and unchanged drug)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness is common

Mental Health: Effects on Psychiatric TreatmentNone reported

Cardiovascular ConsiderationsDipyridamole is frequently used in CV stress testing because it increases endogenous adenosine levels and thereby induces myocardial vasodilation in vessels that do not have fixed stenotic lesions. Thus, areas of ischemia are identified. May enhance exercise induced myocardial ischemia in patients with chronic stable angina.

Anesthesia and Critical Care Concerns/Other ConsiderationsFor patients undergoing CABG, the Seventh American College of Chest Physicians Consensus Conference recommended against the addition of dipyridamole to aspirin therapy.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Disopyramide may be confused with desipramine, dipyridamole

Norpace® may be confused with Norpramin®

Pronunciation(dye soe PEER a mide)

U.S. Brand NamesNorpace®; Norpace® CR

Canadian Brand NamesNorpace®; Rythmodan®; Rythmodan®-LA

Pharmacologic CategoryAntiarrhythmic Agent, Class Ia

Use: Labeled IndicationsSuppression and prevention of unifocal and multifocal atrial and premature, ventricular premature complexes, coupled ventricular tachycardia; effective in the conversion of atrial fibrillation, atrial flutter, and paroxysmal atrial tachycardia to normal sinus rhythm and prevention of the recurrence of these arrhythmias after conversion by other methods

Use: Unlabeled/InvestigationalHypertrophic obstructive cardiomyopathy (HOCM)

Dosing: Adults

Dysrhythmia: Oral:

<50 kg: 100 mg every 6 hours or 200 mg every 12 hours (controlled release)

>50 kg: 150 mg every 6 hours or 300 mg every 12 hours (controlled release); if no response, may increase to 200 mg every 6 hours; maximum dose required for patients with severe refractory ventricular tachycardia is 400 mg every 6 hours.

Hypertrophic obstructive cardiomyopathy (unlabeled use): Oral: Initial: Controlled release: 200 mg twice daily. If symptoms do not improve, increase by 100 mg/day at 2-week intervals to a maximum daily dose of 600 mg.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricAntiarrhythmic: Oral:

<1 year: 10-30 mg/kg/24 hours in 4 divided doses

1-4 years: 10-20 mg/kg/24 hours in 4 divided doses

4-12 years: 10-15 mg/kg/24 hours in 4 divided doses

12-18 years: 6-15 mg/kg/24 hours in 4 divided doses

Dosing: Renal ImpairmentOral: 100 mg (nonsustained release) given at the following intervals, based on creatinine clearance (mL/minute):

Cl_{cr} 30-40 mL/minute: Administer every 8 hours

Cl_{cr} 15-30 mL/minute: Administer every 12 hours

Cl_{cr} <15 mL/minute: Administer every 24 hours

or alter the dose as follows:

Cl_{cr} 30-<40 mL/minute: Reduce dose 50%

Cl_{cr} 15-30 mL/minute: Reduce dose 75%

Not dialyzable (0% to 5%) by hemo- or peritoneal methods; supplemental dose is not necessary.

Dosing: Hepatic ImpairmentAdminister 100 mg every 6 hours or 200 mg every 12 hours (controlled release).

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralDo not break or chew controlled release capsules. Administer around-the-clock to promote less variation in peak and trough serum levels.

Dietary ConsiderationsShould be taken on an empty stomach.

StorageExtemporaneously prepared suspension is stable for 4 weeks refrigerated.

Extemporaneously PreparedExtemporaneous suspensions in cherry syrup (1 mg/mL and 10 mg/mL) are stable for 4 weeks in amber glass bottles stored at 5°C, 30°C, or at room temperature; shake well before use; do not use extended release capsules for this suspension

Mathur LK, Lai PK, and Shively CD, "Stability of Disopyramide Phosphate in Cherry Syrup," *Am J Hosp Pharm*, 1982, 39(2):309-10.

ContraindicationsHypersensitivity to disopyramide or any component of the formulation; cardiogenic shock; pre-existing second- or third-degree heart block (except in patients with a functioning artificial pacemaker); congenital QT syndrome; sick sinus syndrome

Warnings/Precautions

Boxed warnings:

- CAST trial: See "Other warnings/precautions" below.

Concerns related to adverse effects:

- Hypotension: May occur during the initiation of therapy; monitor closely.
- Proarrhythmic effects: Watch for proarrhythmic effects; monitor and adjust dose to prevent QT_c prolongation.

Disease-related concerns:

- Atrial fibrillation/flutter: Appropriate use: In patients with atrial fibrillation or flutter, block the AV node before initiating.
- BPH/urinary retention: Do not use in patients with BPH and/or urinary retention due to significant anticholinergic effects.
- Conduction disturbances: Use with caution in patients with bundle branch block or heart block.
- Electrolyte imbalance: Correct electrolyte disturbances, especially hypokalemia or hypomagnesemia, prior to use and throughout therapy.
- Glaucoma: Do not use in patients with glaucoma due to significant anticholinergic effects.
- Heart failure (HF): Use with caution in patients with HF; may precipitate or exacerbate condition.
- Hepatic impairment: Use with caution in patients with hepatic impairment; reduced dosage recommended.
- Myasthenia gravis: Do not use in patients with myasthenia gravis due to significant anticholinergic effects.
- Renal impairment: Use with caution in renal impairment; reduced dosage recommended. The extended release form is not recommended for Cl_{cr} <40 mL/minute.
- Wolff-Parkinson-White syndrome: Use with caution in patients with Wolff-Parkinson-White syndrome.

Concurrent drug therapy issues:

- Drugs with QT prolongation potential: Avoid concurrent use with other drugs known to prolong QT_c interval or decrease myocardial contractibility.

Other warnings/precautions:

- CAST trial: **[U.S. Boxed Warning]: In the Cardiac Arrhythmia Suppression Trial (CAST), recent (>6 days but <2 years ago) myocardial infarction patients with asymptomatic, non-life-threatening ventricular arrhythmias did not benefit and may have been harmed by attempts to suppress the arrhythmia with flecainide or encainide.** An increased mortality or nonfatal cardiac arrest rate (7.7%) was seen in the active treatment group compared with patients in the placebo group (3%). The applicability of the CAST results to other populations is unknown. Antiarrhythmic agents should be reserved for patients with life-threatening ventricular arrhythmias.

Geriatric ConsiderationsDue to changes in total clearance (decreased) in the elderly, monitor closely; the anticholinergic action may be intolerable and require discontinuation; monitor for CNS anticholinergic effects (confusion, agitation, hallucinations, etc). **Note:** Dose needs to be altered with Cl_{cr} <40 mL/minute which may be found frequently in older adults.

Clinical studies of Norpace®/Norpace® CR did not include sufficient numbers of subjects ≥65 years of age to determine whether they respond differently from younger subjects. Other reported clinical experience has not identified differences in responses between elderly and younger patients. In general, dose selection for an elderly patient should be cautious, usually starting at the low end of the dosing range, reflecting the greater frequency of decreased hepatic, renal, or cardiac function, and of concomitant disease or other drug therapy.

Because of its anticholinergic activity, disopyramide phosphate should not be used in patients with glaucoma, urinary retention, or benign prostatic hyperplasia (medical conditions commonly associated with the elderly) unless adequate overriding measures are taken. In the event of increased anticholinergic side effects, plasma levels of disopyramide should be monitored and the dose of the drug adjusted accordingly. A reduction of the dose by one third, from the recommended 600 mg/day to 400 mg/day, would be reasonable, without changing the dosing interval. This drug is known to be substantially excreted by the kidney, and the risk of toxic reactions to this drug may be greater in patients with impaired renal function. Because elderly patients are more likely to have decreased renal function, care should be taken in dose selection, and it may be useful to monitor renal function.

Pregnancy Risk FactorC

LactationEnters breast milk/compatible

Adverse ReactionsThe most common adverse effects are related to cholinergic blockade. The most serious adverse effects of disopyramide are hypotension and CHF.

>10%:

- Gastrointestinal: Xerostomia (32%), constipation (11%)
- Genitourinary: Urinary hesitancy (14% to 23%)

1% to 10%:

- Cardiovascular: CHF, hypotension, cardiac conduction disturbance, edema, syncope, chest pain
- Central nervous system: Fatigue, headache, malaise, dizziness, nervousness
- Dermatologic: Rash, generalized dermatoses, pruritus
- Endocrine & metabolic: Hypokalemia, elevated cholesterol, elevated triglycerides
- Gastrointestinal: Dry throat, nausea, abdominal distension, flatulence, abdominal bloating, anorexia, diarrhea, vomiting, weight gain
- Genitourinary: Urinary retention, urinary frequency, urinary urgency, impotence (1% to 3%)
- Neuromuscular & skeletal: Muscle weakness, muscular pain
- Ocular: Blurred vision, dry eyes
- Respiratory: Dyspnea

<1% (Limited to important or life-threatening): Agranulocytosis, arrhythmia (new or worsened, proarrhythmic effect); AV block, BUN increased, cholestatic jaundice, creatinine increased, depression, dysuria, fever, gynecomastia, hematocrit decreased, hemoglobin decreased, hepatotoxicity, hypoglycemia, insomnia, numbness, paresthesia, psychotic reaction, respiratory distress, serum creatinine increased, thrombocytopenia, tingling, transaminases increased. Rare cases of lupus have been reported (generally in patients previously receiving procainamide).

Postmarketing and/or case reports: Peripheral neuropathy, psychosis, pupillary dilation, toxic cutaneous blisters

Metabolism/Transport Effects

Substrate of CYP3A4 (major)

Drug Interactions

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Amiodarone: Antiarrhythmic Agents (Class Ia) may enhance the QTc-prolonging effect of Amiodarone. Amiodarone may increase the metabolism of Antiarrhythmic Agents (Class Ia). *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Disopyramide. *Risk D: Consider therapy modification*

Beta-Blockers: Disopyramide may enhance the bradycardic effect of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Lidocaine: Disopyramide may enhance the arrhythmogenic effect of Lidocaine. Disopyramide may increase the serum concentration of Lidocaine. Specifically, the unbound/free fraction of lidocaine. *Risk C: Monitor therapy*

Macrolide Antibiotics: May enhance the QTc-prolonging effect of Disopyramide. Macrolide Antibiotics may decrease the metabolism of Disopyramide. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk X: Avoid combination*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

Phenytoin: May increase the metabolism of Disopyramide. *Risk D: Consider therapy modification*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

Rifamycin Derivatives: May increase the metabolism of Disopyramide. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: St John's wort may decrease disopyramide levels. Avoid ephedra (may worsen arrhythmia).

Monitoring ParametersECG, blood pressure, urinary retention, CNS anticholinergic effects (confusion, agitation, hallucinations, etc)

Reference Range

Therapeutic concentration:

Atrial arrhythmias: 2.8-3.2 mcg/mL

Ventricular arrhythmias 3.3-7.5 mcg/mL

Toxic concentration: >7 mcg/mL

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions when beginning therapy, when titrating dosage, and periodically during long-term therapy. **Note:** Disopyramide has a low toxic:therapeutic ratio and overdose may easily produce severe and life threatening reactions. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsECG, disopyramide drug level

Patient EducationTake as directed, at regular intervals around-the-clock on an empty stomach. Do not alter dosage or discontinue therapy without consulting prescriber. Do not crush or chew extended release form. Avoid (or limit) alcohol and caffeine. You may experience dizziness or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or dry mouth (frequent mouth care or sucking on lozenges may help). Report any change in urinary pattern or difficulty urinating; chest pain, palpitations, irregular heartbeat; unusual cough, respiratory difficulty, swelling of extremities; muscle tremors or weakness; confusion or acute lethargy; or skin rash. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule (Norpace®): 100 mg, 150 mg

Capsule, controlled release (Norpace® CR): 100 mg, 150 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Capsule, 12-hour (Disopyramide Phosphate)

150 mg (30): $43.10

Capsule, 12-hour (Norpace CR)

100 mg (60): $92.99

150 mg (60): $107.27

Capsules (Disopyramide Phosphate)

100 mg (90): $36.99

150 mg (30): $19.99

Capsules (Norpace)

100 mg (90): $128.69

150 mg (30): $51.99

Mechanism of ActionClass Ia antiarrhythmic: Decreases myocardial excitability and conduction velocity; reduces disparity in refractory between normal and infarcted myocardium; possesses anticholinergic, peripheral vasoconstrictive, and negative inotropic effects

Pharmacodynamics/Kinetics

Onset of action: 0.5-3.5 hours

Duration: 1.5-8.5 hours

Absorption: 60% to 83%

Protein binding (concentration dependent): 20% to 60%

Metabolism: Hepatic to inactive metabolites

Half-life elimination: Adults: 4-10 hours; prolonged with hepatic or renal impairment

Excretion: Urine (40% to 60% as unchanged drug); feces (10% to 15%)

Related Information

- Antiarrhythmic Drugs

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsDisopyramide is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution.

Mental Health: Effects on Mental StatusMay cause drowsiness or nervousness; rare reports of depression and psychosis

Mental Health: Effects on Psychiatric TreatmentContraindicated with ziprasidone; use cautiously with TCAs; may cause AV block or QT prolongation; phenobarbital and carbamazepine may decrease the effects of disopyramide via enzyme induction

Cardiovascular ConsiderationsDisopyramide has limited antiarrhythmic effects and has a very narrow therapeutic index. Close monitoring of ECG, particularly of the QT interval, should be conducted when initiating therapy. Increases in QT >25% over baseline should result in cessation or reduction in disopyramide dosing. In patients with pre-existing cardiovascular disease, the incidence of proarrhythmic effects and mortality may be increased with Class Ia antiarrhythmic agents.

Disopyramide has significant anticholinergic effects which also limits its role in patients with cardiovascular disease. Disopyramide is being used experimentally for the treatment of vasovagal syncope.

Disopyramide may be used in the treatment of HOCM as it significantly reduces the left ventricular outflow gradient and improves symptoms. Some patients may not tolerate the anticholinergic effects such as dry mouth or urinary retention, frequency, and urgency. Up to $^{1}/_{3}$ may not improve and will require other nonpharmacologic interventions.

Anesthesia and Critical Care Concerns/Other ConsiderationsIn patients with pre-existing cardiovascular disease, the incidence of proarrhythmic effects and mortality may be increased with Class Ia antiarrhythmic agents. Disopyramide has significant anticholinergic effects which also limits its role in patients with cardiovascular disease.

Index TermsDisopyramide Phosphate

Medication Safety Issues

Sound-alike/look-alike issues:

Disulfiram may be confused with Diflucan®

Antabuse® may be confused with Anturane®

Pronunciation(dye SUL fi ram)

U.S. Brand NamesAntabuse®

Pharmacologic CategoryAldehyde Dehydrogenase Inhibitor

Use: Labeled IndicationsManagement of chronic alcoholism

Dosing: Adults**Note:** Do not administer until the patient has abstained from ethanol for at least 12 hours.

Alcoholism: Oral: Initial: 500 mg/day as a single dose for 1-2 weeks; maximum daily dose is 500 mg. Average maintenance dose: 250 mg/day; range: 125-500 mg; duration of therapy is to continue until the patient is fully recovered socially and a basis for permanent self control has been established. Maintenance therapy may be required for months or even years.

Dosing: ElderlyRefer to adult dosing.

Administration: OralAdministration of any medications containing alcohol, including topicals, is contraindicated. Do not administer disulfiram if ethanol has been consumed within the prior 12 hours.

ContraindicationsHypersensitivity to disulfiram and related compounds or any component of the formulation; patients receiving or using ethanol, metronidazole, paraldehyde, or ethanol-containing preparations like cough syrup or tonics; psychosis; severe myocardial disease and coronary occlusion

Warnings/Precautions

Boxed warnings:

- Ethanol intoxication: See “Other warnings/precautions” below.

Concerns related to adverse effects:

- Hepatotoxicity: Severe (sometimes fatal) hepatitis and/or hepatic failure have been associated with use; may occur in patients with or without prior history of abnormal hepatic function.

Disease-related concerns:

- Diabetes: Use with caution in patients with diabetes mellitus.
- Hepatic impairment: Use with caution in patients with hepatic cirrhosis or impairment.
- Hypothyroidism: Use with caution in patients with hypothyroidism.
- Nephritis: Use with caution in patients with acute or chronic nephritis.
- Seizures: Use with caution in patients with a history of seizure disorder.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Ethanol intoxication: **[U.S. Boxed Warning]: Should never be administered to a patient when he/she is in a state of ethanol intoxication, or without his/her knowledge.**
- Patient information: Patients must receive appropriate counseling, including information on “disguised” forms of ethanol (tonics, mouthwashes, etc) and the duration of the drug's activity (up to 14 days).

Pregnancy Risk FactorC

LactationExcretion in breast milk unknown

Adverse ReactionsFrequency not defined.

Central nervous system: Drowsiness, headache, fatigue, psychosis

Dermatologic: Rash, acneiform eruptions, allergic dermatitis

Gastrointestinal: Metallic or garlic-like aftertaste

Genitourinary: Impotence

Hepatic: Hepatitis (cholestatic and fulminant), hepatic failure (multiple case reports)

Neuromuscular & skeletal: Peripheral neuritis, polyneuritis, peripheral neuropathy

Ocular: Optic neuritis

Metabolism/Transport Effects**Substrate** (minor) of CYP1A2, 2A6, 2B6, 2D6, 2E1, 3A4; **Inhibits** CYP1A2 (weak), 2A6 (weak), 2B6 (weak), 2C9 (weak), 2D6 (weak), 2E1 (strong), 3A4 (weak)

Drug Interactions

Alcohol (Ethyl): Disulfiram may enhance the adverse/toxic effect of Alcohol (Ethyl). A disulfiram-like reaction may occur. *Risk X: Avoid combination*

Amprenavir: Disulfiram may enhance the adverse/toxic effect of Amprenavir. This is specifically related to the propylene glycol contained in amprenavir oral solution, not capsules. Management: Specifically, concurrent amprenavir oral solution and disulfiram is contraindicated due to the large amount of propylene glycol in the oral solution. *Risk X: Avoid combination*

Benzodiazepines (metabolized by oxidation): Disulfiram may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Chlorzoxazone: Disulfiram may decrease the metabolism of Chlorzoxazone. *Risk C: Monitor therapy*

CYP2E1 Substrates: CYP2E1 Inhibitors (Strong) may decrease the metabolism of CYP2E1 Substrates. *Risk D: Consider therapy modification*

MetroNIDAZOLE: Disulfiram may enhance the adverse/toxic effect of MetroNIDAZOLE. *Risk D: Consider therapy modification*

Phenytoin: Disulfiram may decrease the metabolism of Phenytoin. *Risk D: Consider therapy modification*

Ritonavir: Disulfiram may enhance the adverse/toxic effect of Ritonavir. This is specific for the lopinavir/ritonavir (Kaletra) oral solution due to its alcohol content (42%). Management: Concomitant use of Kaletra (lopinavir/ritonavir) oral solution and disulfiram should be avoided. Kaletra contains 42% alcohol. *Risk X: Avoid combination*

Sertraline: Disulfiram may enhance the adverse/toxic effect of Sertraline. This is specifically related to sertraline oral concentrate due to its alcohol content (12%). Management: Sertraline Oral Concentrate contains 12% alcohol, and its use should be avoided with disulfiram. *Risk X: Avoid combination*

Theophylline Derivatives: Disulfiram may increase the serum concentration of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Tipranavir: Disulfiram may enhance the adverse/toxic effect of Tipranavir. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Disulfiram may increase the serum concentration of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Disulfiram inhibits ethanol's usual metabolism. Avoid all ethanol. Patients can have a disulfiram reaction (headache, nausea, vomiting, chest, or abdominal pain) if they drink ethanol concurrently. Avoid cough syrups and elixirs containing ethanol. Avoid vinegars, cider, extracts, and foods containing ethanol.

Monitoring ParametersHypokalemia; liver function tests at baseline and after 10-14 days of treatment; CBC, serum chemistries, liver function tests should be monitored during therapy

Nursing: Physical Assessment/MonitoringAssess for adverse drug interactions with other prescription or OTC drugs. Do not administer until the patient has abstained from ethanol for 12 hours. Assess results of laboratory tests and for CNS changes at beginning of therapy and periodically with long-term therapy. Advise patient about disulfiram reaction if alcohol is ingested. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsMonitor liver function before, 10-14 days after beginning therapy, and every 6 months during therapy.

Patient EducationTablets can be crushed or mixed with water or juice. Metallic aftertaste may occur; this will go away. Do not drink any alcohol, including products containing alcohol (such as cough and cold syrups or some mouthwashes), or use alcohol-containing skin products while taking this medication and for at least 3 days (preferably 14 days) after stopping this medication. Drowsiness, tiredness, or visual changes may occur. Use care when driving or engaging in tasks requiring alertness until response to drug is known. Notify prescriber of any respiratory difficulty, weakness, nausea, vomiting, decreased appetite, yellowing of skin or eyes, or dark-colored urine. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Antabuse®: 250 mg, 500 mg

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Tablets (Antabuse)

250 mg (30): $105.59

Mechanism of ActionDisulfiram is a thiuram derivative which interferes with aldehyde dehydrogenase. When taken concomitantly with alcohol, there is an increase in serum acetaldehyde levels. High acetaldehyde causes uncomfortable symptoms including flushing, nausea, thirst, palpitations, chest pain, vertigo, and hypotension. This reaction is the basis for disulfiram use in postwithdrawal long-term care of alcoholism.

Pharmacodynamics/Kinetics

Onset of action: Full effect: 12 hours

Duration: ~1-2 weeks after last dose

Absorption: Rapid

Metabolism: To diethylthiocarbamate

Excretion: Feces and exhaled gases (as metabolites)

Related Information

- Addiction Treatments
- Depression

Dental Health: Effects on Dental Treatment No significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions
Mental Health: Effects on Mental Status Psychotic reactions have been noted

Medication Safety Issues

Sound-alike/look-alike issues:

DOBUTamine may be confused with DOPamine

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(doe BYOO ta meen)

Canadian Brand NamesDobutamine Injection, USP; Dobutrex®

Pharmacologic CategoryAdrenergic Agonist Agent

Use: Labeled IndicationsShort-term management of patients with cardiac decompensation

Use: Unlabeled/InvestigationalPositive inotropic agent for use in myocardial dysfunction of sepsis

Dosing: AdultsCardiac decompensation: I.V. infusion: 2.5-20 mcg/kg/minute; maximum: 40 mcg/kg/minute, titrate to desired response; see table.

Infusion Rates of Various Dilutions of Dobutamine

Desired Delivery Rate (mcg/kg/min)	**Infusion Rate (mL/kg/min)**	
	500 mcg/mL[1]	**1000 mcg/mL**[2]
2.5	0.005	0.0025
5.0	0.01	0.005
7.5	0.015	0.0075
10.0	0.02	0.01
12.5	0.025	0.0125
15.0	0.03	0.015
[1] 500 mg per liter or 250 mg per 500 mL of diluent.		
[2] 1000 mg per liter or 250 mg per 250 mL of diluent.		

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricCardiac decompensation: Refer to adult dosing.

Calculations

- Dobutamine

Administration: I.V.Always administer via infusion device; administer into large vein.

Administration: I.V. DetailpH: 2.5-5.5

StorageStore reconstituted solution under refrigeration for 48 hours or 6 hours at room temperature. Stability of parenteral admixture at room temperature (25°C) is 48 hours; at refrigeration (4°C) stability is 7 days.

ReconstitutionRemix solution every 24 hours. Pink discoloration of solution indicates slight oxidation but **no** significant loss of potency.

Standard adult diluent: 250 mg/500 mL D_5W; 500 mg/500 mL D_5W.

CompatibilityStable in D_5LR, $D_5{}^1/_2NS$, D_5NS, D_5W, $D_{10}W$, LR, $^1/_2NS$, NS, mannitol 20%; **incompatible** with sodium bicarbonate 5%; **variable stability (consult detailed reference)** in peritoneal dialysis solutions.

Y-site administration: Compatible: Amifostine, amiodarone, atracurium, aztreonam, bretylium, calcium chloride, calcium gluconate, ciprofloxacin, cisatracurium, cladribine, clarithromycin, diazepam, diltiazem, docetaxel, dopamine, dopamine with lidocaine, dopamine with nitroglycerin, dopamine with sodium nitroprusside, doxorubicin liposome, enalaprilat, epinephrine, etoposide, famotidine, fentanyl, fluconazole, gatifloxacin, gemcitabine, granisetron, haloperidol, hydromorphone, inamrinone, insulin (regular), labetalol, levofloxacin, lidocaine, lidocaine with nitroglycerin, lidocaine with sodium nitroprusside, linezolid, lorazepam, magnesium sulfate, meperidine, milrinone, morphine, nicardipine, nitroglycerin, nitroglycerin with sodium nitroprusside, norepinephrine, pancuronium, potassium chloride, propofol, ranitidine, remifentanil, sodium nitroprusside, streptokinase, tacrolimus, theophylline, thiotepa, tolazoline, vecuronium, verapamil, zidovudine. **Incompatible:** Acyclovir, alatrofloxacin, alteplase, aminophylline, amphotericin B cholesteryl sulfate complex, cefepime, foscarnet, indomethacin, phytonadione, piperacillin/tazobactam, thiopental, warfarin. **Variable (consult detailed reference):** Furosemide, heparin, midazolam.

Compatibility in syringe: Compatible: Heparin, ranitidine. **Incompatible:** Doxapram.

Compatibility when admixed: Compatible: Amiodarone, atracurium, atropine, dopamine, enalaprilat, epinephrine, flumazenil, hydralazine, isoproterenol, lidocaine, meperidine, meropenem, metaraminol, morphine, nitroglycerin, norepinephrine, phentolamine, phenylephrine, procainamide, propranolol, ranitidine. **Incompatible:** Acyclovir, alteplase, aminophylline, bumetanide, calcium gluconate, diazepam, digoxin, floxacillin, furosemide, insulin (regular), magnesium sulfate, phenytoin, potassium phosphates, sodium bicarbonate. **Variable (consult detailed reference):** Bretylium, calcium chloride, heparin, nitroglycerin with sodium nitroprusside, potassium chloride, verapamil.

ContraindicationsHypersensitivity to dobutamine or sulfites (some contain sodium metabisulfate), or any component of the formulation; idiopathic hypertrophic subaortic stenosis (IHSS)

Warnings/Precautions

Concerns related to adverse effects:

- Blood pressure effects: An increase in blood pressure is more common, but occasionally a patient may become hypotensive.
- Tachycardia: May increase heart rate.
- Ventricular ectopy: May exacerbate ventricular ectopy.

Disease-related concerns:

- Aortic stenosis: Ineffective therapeutically in the presence of mechanical obstruction such as severe aortic stenosis.
- Atrial fibrillation: Patients with atrial fibrillation may experience an increase in ventricular response.
- Hypovolemia: If needed, correct hypovolemia first to optimize hemodynamics.
- Myocardial infarct (post): Use with caution in patients post-MI; can increase myocardial oxygen demand.

Concurrent drug therapy issues:

- Monoamine oxidase inhibitors (MAO-I): Use with extreme caution in patients taking MAO inhibitors; prolong hypertension may result from concurrent use.

Dosage form specific issues:

- Sodium sulfite: Product may contain sodium sulfite.

Special populations:

- Elderly: Use with caution in the elderly; start at lower end of the dosage range.

Other warnings/precautions:

- Diagnostic testing: Dobutamine in combination with stress echo may be used diagnostically.

Geriatric ConsiderationsA recent study demonstrated beneficial hemodynamic effects in elderly patients; monitor closely.

Pregnancy Risk FactorB

LactationExcretion in breast milk unknown

Adverse ReactionsIncidence of adverse events is not always reported.

Cardiovascular: Increased heart rate, increased blood pressure, increased ventricular ectopic activity, hypotension, premature ventricular beats (5%, dose related), anginal pain (1% to 3%), nonspecific chest pain (1% to 3%), palpitation (1% to 3%)

Central nervous system: Fever (1% to 3%), headache (1% to 3%), paresthesia

Endocrine & metabolic: Slight decrease in serum potassium

Gastrointestinal: Nausea (1% to 3%)

Hematologic: Thrombocytopenia (isolated cases)

Local: Phlebitis, local inflammatory changes and pain from infiltration, cutaneous necrosis (isolated cases)

Neuromuscular & skeletal: Mild leg cramps

Respiratory: Dyspnea (1% to 3%)

Drug Interactions

Calcium Salts: May diminish the therapeutic effect of DOBUTamine. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

COMT Inhibitors: May decrease the metabolism of COMT Substrates. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Monitoring ParametersBlood pressure, ECG, heart rate, CVP, RAP, MAP, urine output; if pulmonary artery catheter is in place, monitor CI, PCWP, and SVR; also monitor serum potassium

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Infusion pump and continuous cardiac and hemodynamic monitoring are required. Monitor therapeutic effectiveness and adverse reactions. Instruct patient on adverse symptoms to report.

Monitoring: Lab TestsSerum glucose, renal function

Patient EducationWhen administered in emergencies, patient education should be appropriate to the situation. If patient is aware, instruct to promptly report chest pain, palpitations, rapid heartbeat, headache, nervousness, or restlessness, nausea or vomiting, or respiratory difficulty. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Infusion, as hydrochloride [premixed in dextrose]: 1 mg/mL (250 mL, 500 mL); 2 mg/mL (250 mL); 4 mg/mL (250 mL)

Injection, solution, as hydrochloride: 12.5 mg/mL (20 mL, 40 mL, 100 mL) [contains sodium bisulfite]

Generic AvailableYes

Mechanism of ActionStimulates beta$_1$-adrenergic receptors, causing increased contractility and heart rate, with little effect on beta$_2$- or alpha-receptors

Pharmacodynamics/Kinetics

Onset of action: I.V.: 1-10 minutes

Peak effect: 10-20 minutes

Metabolism: In tissues and hepatically to inactive metabolites

Half-life elimination: 2 minutes

Excretion: Urine (as metabolites)

Related Information

- Hemodynamic Support, Intravenous

Pharmacotherapy PearlsDobutamine lowers central venous pressure and wedge pressure but has little effect on pulmonary vascular resistance.

Dobutamine therapy should be avoided in patients with stable heart failure due to an increase in mortality. In patients with intractable heart failure, dobutamine may be used as a short-term infusion to provide symptomatic benefit. It is not known whether short-term dobutamine therapy in end-stage heart failure has any outcome benefit.

Dobutamine infusion during echocardiography is used as a cardiovascular stress. Wall motion abnormalities developing with increasing doses of dobutamine may help to identify ischemic and/or hibernating myocardium.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Cardiovascular ConsiderationsDobutamine therapy should be avoided in patients with stable heart failure due to an increase in mortality. In patients with intractable heart failure, dobutamine may be used as a short-term infusion to provide symptomatic benefit. It is not known whether short-term dobutamine therapy in end-stage heart failure has any outcome benefit.

Dobutamine infusion during echocardiography is used as a cardiovascular stress. Wall motion abnormalities developing with increasing doses of dobutamine may help to identify ischemic and/or hibernating myocardium.

Anesthesia and Critical Care Concerns/Other Considerations**Septic Shock:** Septic patients who have been adequately fluid resuscitated and have an adequate mean arterial pressure but low cardiac index (<2.5 L/minute/m^2) may require dobutamine. Dobutamine may help reverse tissue hypoperfusion by increasing cardiac output. Increasing cardiac output beyond the normal range has not been shown in clinical trials to improve patient outcome. The 2008 Surviving Sepsis Campaign guidelines recommend the use of dobutamine infusion when myocardial dysfunction is present with the goal of normalizing cardiac output. Avoid trying to increase cardiac index to supranormal levels (Grade 1C).

Early goal-directed therapy in the treatment of severe sepsis and septic shock provides significant survival benefits to this subset of patients. About 14% of the patients in the early goal-directed group received dobutamine. The early goal-directed patients received significantly more fluid, red-cell transfusions, and inotropic support during the initial 6 hours of their visit (Rivers, 2001). The 2008 Surviving Sepsis Campaign guidelines suggest that if central venous (superior vena cava) or mixed venous oxygen saturation of ≥70% or ≥65%, respectively, is not achieved (central venous pressure 8-12 mm Hg) within the first 6 hours of resuscitation, then transfuse packed red blood cells to a hematocrit of ≥30% and/or administer dobutamine (up to 20 mcg/kg/minute) to achieve this goal (Grade 2C).

Index Terms Dobutamine Hydrochloride

Regimen

Cycle 1:

Trastuzumab: I.V.: 4 mg/kg (loading dose) day 1 cycle 1

followed by I.V.: 2 mg/kg/day days 8 and 15 cycle 1

[total dose/cycle 1 = 8 mg/kg]

Docetaxel: I.V.: 75 mg/m^2 day 2

[total dose/cycle 1 = 75 mg/m^2]

Carboplatin: I.V.: AUC 6 day 2

[total dose/cycle 1 = AUC = 6]

Treatment cycle is 21 days

Subsequent cycles:

Trastuzumab: I.V.: 2 mg/kg/day days 1, 8, and 15

[total dose/cycle = 6 mg/kg]

Docetaxel: I.V.: 75 mg/m^2 day 1

[total dose/cycle = 75 mg/m^2]

Carboplatin: I.V.: AUC 6 day 1

[total dose/cycle = AUC = 6]

Repeat cycle every 21 days for a total of ~6 cycles (continue weekly trastuzumab for 1 year after chemotherapy, or until disease progression or unacceptable toxicity)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Taxotere® may be confused with Taxol®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(doe se TAKS el)

U.S. Brand NamesTaxotere®

Canadian Brand NamesTaxotere®

Pharmacologic CategoryAntineoplastic Agent, Antimicrotubular; Antineoplastic Agent, Natural Source (Plant) Derivative; Antineoplastic Agent, Taxane Derivative

Use: Labeled IndicationsTreatment of breast cancer; locally-advanced or metastatic nonsmall cell lung cancer (NSCLC); hormone refractory, metastatic prostate cancer; advanced gastric adenocarcinoma; locally-advanced squamous cell head and neck cancer

Use: Unlabeled/InvestigationalTreatment of bladder cancer, ovarian cancer, small cell lung cancer, and soft tissue sarcoma

Dosing: Adults**Note:** Premedicate with corticosteroids, beginning the day before docetaxel administration, (administer for 1-5 days) to reduce the severity of hypersensitivity reactions and pulmonary/peripheral edema. Refer to individual protocols:

Breast cancer: I.V.:

Locally-advanced or metastatic: 60-100 mg/m^2 every 3 weeks; patients initially started at 60 mg/m^2 who do not develop toxicity may tolerate higher doses

Operable, node-positive (adjuvant treatment): 75 mg/m^2 every 3 weeks for 6 courses (in combination with doxorubicin and cyclophosphamide)

Nonsmall cell lung cancer: I.V.: 75 mg/m^2 every 3 weeks (as monotherapy or in combination with cisplatin)

Prostate cancer: I.V.: 75 mg/m^2 every 3 weeks (in combination with prednisone)

Gastric adenocarcinoma: I.V.: 75 mg/m^2 every 3 weeks (in combination with cisplatin and fluorouracil)

Head and neck cancer: I.V.: 75 mg/m^2 every 3 weeks (in combination with cisplatin and fluorouracil) for 3 or 4 cycles, followed by radiation therapy

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentDocetaxel has minimal renal excretion; dosage adjustments for renal dysfunction may not be needed.

Dosing: Hepatic Impairment

The FDA-approved labeling recommends the following adjustments:

Total bilirubin greater than the ULN, or AST/ALT >1.5 times ULN concomitant with alkaline phosphatase >2.5 times ULN: Docetaxel **generally should not be administered**.

Hepatic impairment dosing adjustment specific for gastric adenocarcinoma:

AST/ALT >2.5 to ≤5 times ULN and alkaline phosphatase ≤2.5 times ULN: Administer 80% of dose

AST/ALT >1.5 to ≤5 times ULN and alkaline phosphatase >2.5 to ≤5 times ULN: Administer 80% of dose

AST/ALT >5 times ULN and /or alkaline phosphatase >5 times ULN: Discontinue docetaxel

The following guidelines have been used by some clinicians (Floyd, 2006):

AST/ALT 1.6-6 times ULN: Administer 75% of dose

AST/ALT >6 times ULN: Use clinical judgment

Dosing: Adjustment for Toxicity**Note:** Toxicity includes febrile neutropenia, neutrophils ≤500/mm^3 for >1 week, severe or cumulative cutaneous reactions; in nonsmall cell lung cancer, this may also include platelets <25,000/mm^3 and other grade 3/4 nonhematologic toxicities.

Breast cancer: Patients dosed initially at 100 mg/m^2; reduce dose to 75 mg/m^2; **Note:** If the patient continues to experience these adverse reactions, the dosage should be reduced to 55 mg/m^2 or therapy should be discontinued; discontinue for peripheral neuropathy ≥ grade 3

Breast cancer, adjuvant treatment: TAC regimen should be administered when neutrophils are ≥1500 cells/mm^3. Patients experiencing febrile neutropenia should receive G-CSF in all subsequent cycles. Patients with persistent febrile neutropenia (while on G-CSF) or patients experiencing severe/cumulative cutaneous reactions or moderate neurosensory effects (signs/symptoms) should receive a reduced dose (60 mg/m^2) of docetaxel. Patients who experience grade 3 or 4 stomatitis should also receive a reduced dose (60 mg/m^2) of docetaxel. Discontinue therapy with persistent toxicities after dosage reduction.

Nonsmall cell lung cancer:

Monotherapy: Patients dosed initially at 75 mg/m^2 should have dose held until toxicity is resolved, then resume at 55 mg/m^2; discontinue for peripheral neuropathy ≥ grade 3.

Combination therapy (with cisplatin): Patients dosed initially at 75 mg/m^2 should have the docetaxel dosage reduced to 65 mg/m^2 in subsequent cycles; if further adjustment is required, dosage may be reduced to 50 mg/m^2

Prostate cancer: Reduce dose to 60 mg/m^2; discontinue therapy if toxicities persist at lower dose.

Gastric cancer, head and neck cancer: **Note:** Cisplatin may require dose reductions/therapy delays for peripheral neuropathy, ototoxicity, and /or nephrotoxicity. Patients experiencing febrile neutropenia, documented infection with neutropenia or neutropenia >7 days should receive G-CSF in all subsequent cycles. For neutropenic complications despite G-CSF use, further reduce dose to 60 mg/m^2. Neutropenic complications in subsequent cycles should be further dose reduced to 45 mg/m^2. Patients who experience grade 4 thrombocytopenia should receive a dose reduction from 75 mg/m^2 to 60 mg/m^2. Discontinue therapy for persistent toxicities.

Gastrointestinal toxicity for docetaxel in combination with cisplatin and fluorouracil for treatment of gastric cancer or head and neck cancer:

Diarrhea, grade 3:

First episode: Reduce fluorouracil dose by 20%

Second episode: Reduce docetaxel dose by 20%

Diarrhea, grade 4:

First episode: Reduce fluorouracil and docetaxel doses by 20%

Second episode: Discontinue treatment

Stomatitis, grade 3:

First episode: Reduce fluorouracil dose by 20%

Second episode: Discontinue fluorouracil for all subsequent cycles

Third episode: Reduce docetaxel dose by 20%

Stomatitis, grade 4:

First episode: Discontinue fluorouracil for all subsequent cycles

Second episode: Reduce docetaxel dose by 20%

Dosing: Combination Regimens

Soft tissue sarcoma: Gemcitabine-Docetaxel (Sarcoma)

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics

Administration: I.V.Administer I.V. infusion over 1-hour through nonsorbing polyethylene lined (non-DEHP) tubing; in-line filter is not necessary (the use of a filter during administration is not recommended by the manufacturer). **Note:** Premedication with corticosteroids for 1-5 days, beginning the day before docetaxel administration, is recommended to prevent hypersensitivity reactions and pulmonary/peripheral edema (see Additional Information).

StorageIntact vials should be stored at 2°C to 25°C (36°F to 77°F) and protected from light. Freezing does not adversely affect the product. If refrigerated, vials should be stored at room temperature for approximately 5 minutes before using. Diluted solutions in the vial are stable for 8 hours at room temperature or under refrigeration. Solutions diluted for infusion in D_5W or NS are stable for up to 4 weeks at room temperature of 15°C to 25°C (59°F to 77°F) in polyolefin containers; however, the manufacturer recommends use within 4 hours.

ReconstitutionVials should be diluted with 13% (w/w) ethanol/water (provided with the drug) to a final concentration of 10 mg/mL. Do not shake. The solution should be further diluted in 250-1000 mL of NS or D_5W to a final concentration of 0.3-0.9 mg/mL (although the manufacturer recommends a final concentration of 0.3-0.74) and dispensed in a non-DEHP container (eg, glass, polypropylene, polyolefin).

CompatibilityStable in D_5W, NS.

Y-site administration: Compatible: Acyclovir, amifostine, amikacin, aminophylline, ampicillin, ampicillin/sulbactam, anidulafungin, aztreonam, bumetanide, buprenorphine, butorphanol, calcium gluconate, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chlorpromazine, cimetidine, ciprofloxacin, clindamycin, co-trimoxazole, dexamethasone sodium phosphate, diphenhydramine, dobutamine, dopamine, doxycycline, droperidol, enalaprilat, famotidine, fluconazole, furosemide, ganciclovir, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hydrocortisone sodium succinate, hydromorphone, hydroxyzine, imipenem/cilastatin, leucovorin calcium, lorazepam, magnesium sulfate, mannitol, meperidine, meropenem, mesna, metoclopramide, metronidazole, morphine, ofloxacin, ondansetron, oxaliplatin, palonosetron, pemetrexed, piperacillin, piperacillin/tazobactam, potassium chloride, prochlorperazine edisylate, promethazine, ranitidine, Ringer's injection (lactated), sodium bicarbonate, ticarcillin/clavulanate, tobramycin, vancomycin, zidovudine. **Incompatible:** Amphotericin B, doxorubicin liposome, methylprednisolone sodium succinate, nalbuphine.

ContraindicationsHypersensitivity to docetaxel or any component of the formulation; prior hypersensitivity to medications containing polysorbate 80; pre-existing bone marrow suppression (neutrophils <1500 cells/mm^3)

Allergy Considerations

- Taxane Allergy

Warnings/Precautions

Boxed warnings:

- Fluid retention syndrome: See “Concerns related to adverse effects” below.

- Hepatic impairment: See "Disease-related concerns" below.
- Hypersensitivity reactions: See "Concerns related to adverse effects" below.
- Neutropenia: See "Concerns related to adverse effects" below.
- Treatment-related mortality: See "Concerns related to adverse effects" below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Cutaneous reactions: With use, cutaneous reactions including erythema and desquamation have been reported; may require dose reduction.
- Fluid retention: **[U.S. Boxed Warning]: Fluid retention syndrome characterized by pleural effusions, ascites, edema, and weight gain (2-15 kg) has also been reported.** The incidence and severity of the syndrome increase sharply at cumulative doses ≥400 mg/m^2. Patients should be premedicated with a corticosteroid to prevent fluid retention; severity is reduced with dexamethasone premedication starting one day prior to docetaxel administration.
- Hypersensitivity reactions: **[U.S. Boxed Warning]: Severe hypersensitivity reactions characterized by rash/erythema, hypotension, bronchospasms, or anaphylaxis may occur;** minor reactions including flushing or localized skin reactions may also occur. Patients should be premedicated with a corticosteroid to prevent hypersensitivity reactions; severity is reduced with dexamethasone premedication starting one day prior to docetaxel administration.
- Neurosensory symptoms: Dosage adjustment is recommended with severe neurosensory symptoms (paresthesia, dysesthesia, pain); persistent symptoms may require discontinuation.
- Neutropenia: **[U.S. Boxed Warning]: Patients with an absolute neutrophil count <1500 cells/mm^3 should not receive docetaxel.** The dose-limiting toxicity is neutropenia; however, this rarely results in treatment delays and prophylactic colony stimulating factors have not been routinely used. Patients with increased liver function tests experienced more episodes of neutropenia with a greater number of severe infections. When administered as sequential infusions, taxane derivatives (docetaxel, paclitaxel) should be administered before platinum derivatives (carboplatin, cisplatin) to limit myelosuppression and to enhance efficacy.
- Treatment-related mortality: **[U.S. Boxed Warning]: Patients with abnormal liver function, those receiving higher doses, and patients with nonsmall cell lung cancer and a history of prior treatment with platinum derivatives who receive docetaxel doses higher than 100 mg/m^2 are at higher risk for treatment-related mortality.**

Disease-related concerns:

- Hepatic impairment: **[U.S. Boxed Warning]: Avoid use in patients with bilirubin exceeding upper limit of normal (ULN) or AST and/or ALT >1.5 times ULN in conjunction with alkaline phosphatase >2.5 times ULN.** Use caution in hepatic disease; patients with abnormal liver function are at increased risk of treatment-related adverse events.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy Risk FactorD

Pregnancy ConsiderationsAnimal studies have demonstrated embryotoxicity, fetal toxicity, and maternal toxicity. There are no adequate and well-controlled studies in pregnant women; however, fetal harm may occur. Women of childbearing potential should avoid becoming pregnant. A pregnancy registry is available for all cancers diagnosed during pregnancy at Cooper Health (856-757-7876).

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsDue to the potential for serious adverse reactions in nursing the infant, breast-feeding is not recommended.

Adverse ReactionsPercentages reported for docetaxel monotherapy; frequency may vary depending on diagnosis, dose, liver function, prior treatment, and premedication. The incidence of adverse events was usually higher in patients with elevated liver function tests.

>10%:

Cardiovascular: Fluid retention (13% to 60%; dose dependent)

Central nervous system: Neurosensory events (20% to 58%; including neuropathy), fever (31% to 35%), neuromotor events (16%)

Dermatologic: Alopecia (56% to 76%), cutaneous events (20% to 48%), nail disorder (11% to 41%)

Gastrointestinal: Stomatitis (19% to 53%; severe 1% to 8%), diarrhea (23% to 43%; severe: 5% to 6%), nausea (34% to 42%), vomiting (22% to 23%)

Hematologic: Neutropenia (84% to 99%; grade 4: 75% to 86%; onset: 4-7 days, nadir: 5-9 days, recovery: 21 days; dose dependent), leukopenia (84% to 99%; grade 4: 32% to 44%), anemia (65% to 94%; dose dependent; grades 3/4: 8% to 9%), thrombocytopenia (8% to 14%; grade 4: 1%; dose dependent), febrile neutropenia (6% to 12%; dose dependent)

Hepatic: Transaminases increased (4% to 19%)

Neuromuscular & skeletal: Weakness (53% to 66%; severe 13% to 18%), myalgia (3% to 23%)

Respiratory: Pulmonary events (41%)

Miscellaneous: Infection (1% to 34%; dose dependent), hypersensitivity (1% to 21%; with premedication 15%)

1% to 10%:

- Cardiovascular: Left ventricular ejection fraction decreased (prostate cancer: 10%; metastatic breast cancer: 8%), hypotension (3%)
- Dermatologic: Rash/erythema (2%)
- Gastrointestinal: Taste perversion (6%)
- Hepatic: Bilirubin increased (9%), alkaline phosphatase increased (4% to 7%)
- Local: Infusion-site reactions (4%, including hyperpigmentation, inflammation, redness, dryness, phlebitis, extravasation, swelling of the vein)
- Neuromuscular and skeletal: Arthralgia (3% to 9%)
- Ocular: Epiphora associated with canalicular stenosis (≤77% with weekly administration; ≤1% with every-3-week administration)

<1%, postmarketing and/or case reports (limited to important or life-threatening): Acute myeloid leukemia (AML), acute respiratory distress syndrome (ARDS), anaphylactic shock, angina, ascites, atrial fibrillation, atrial flutter, bleeding episodes, bronchospasm, cardiac tamponade, chest pain, chest tightness, colitis, conjunctivitis, constipation, cutaneous lupus erythematosus, deep vein thrombosis, dehydration, disseminated intravascular coagulation (DIC), drug fever, duodenal ulcer, dyspnea, dysrhythmia, ECG abnormalities, erythema multiforme, esophagitis, gastrointestinal hemorrhage, gastrointestinal obstruction, gastrointestinal perforation, hand and foot syndrome, hearing loss, heart failure, hepatitis, hypertension, ileus, interstitial pneumonia, ischemic colitis, lacrimal duct obstruction, loss of consciousness (transient), MI, multiorgan failure, myelodysplastic syndrome, neutropenic enterocolitis, ototoxicity, pleural effusion, pruritus, pulmonary edema, pulmonary embolism, pulmonary fibrosis, radiation pneumonitis, radiation recall, renal insufficiency, seizure, sepsis, sinus tachycardia, Stevens-Johnson syndrome, syncope, toxic epidermal necrolysis, tachycardia, thrombophlebitis, unstable angina, visual disturbances (transient)

Oncology: VesicantNo; may be an irritant

Oncology: Emetic PotentialLow (10% to 30%)

Metabolism/Transport Effects**Substrate** of CYP3A4 (major); **Inhibits** CYP3A4 (weak)

Drug Interactions

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Docetaxel. *Risk D: Consider therapy modification*

Antineoplastic Agents (Anthracycline): Taxane Derivatives may enhance the adverse/toxic effect of Antineoplastic Agents (Anthracycline). Taxane Derivatives may increase the serum concentration of Antineoplastic Agents (Anthracycline). Taxane Derivatives may also increase the formation of toxic anthracycline metabolites in heart tissue. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Platinum Derivatives: May enhance the myelosuppressive effect of Taxane Derivatives. Administer Taxane derivative before Platinum derivative when given as sequential infusions to limit toxicity. *Risk D: Consider therapy modification*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (due to GI irritation).

Herb/Nutraceutical: Avoid St John's wort (may decrease docetaxel levels).

Monitoring ParametersCBC with differential, liver function tests, bilirubin, alkaline phosphatase, renal function; monitor for hypersensitivity reactions, fluid retention, epiphora, and canalicular stenosis

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents or herbal products patient may be taking (eg, drugs that may increase or decrease levels/effects of docetaxel). **Caution:** Severe hypersensitivity reactions have been reported; premedication with dexamethasone may be advisable. Patient should be monitored continuously during infusion; dosing adjustment may be necessary. Assess results of laboratory tests, therapeutic response, and adverse effects (eg, neutropenia, severe fluid retention, pleural effusion, opportunistic infections, anemia) prior to each infusion and on a regular basis throughout therapy. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential, liver function tests, bilirubin, alkaline phosphatase, renal function

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This medication can only be administered by infusion; report immediately any pain, burning, swelling, or redness at infusion site, difficulty breathing or swallowing, chest pain, or sudden chills. It is important to maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake and adequate nutrition (small frequent meals may help). You will be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). May cause nausea or vomiting (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); loss of hair (reversible); or diarrhea (buttermilk, boiled milk, or yogurt may help; if unresolved, contact prescriber for medication relief). Report immediately swelling of extremities, respiratory difficulty, unusual weight gain, abdominal distention, chest pain, palpitations, fever, chills, unusual bruising or bleeding, signs of infection, excessive fatigue, or rash. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant while taking this drug. Consult prescriber for appropriate contraceptives. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [concentrate]:

Taxotere®: 20 mg/0.5 mL (0.5 mL, 2 mL) [contains Polysorbate 80®; diluent contains ethanol 13%]

Generic AvailableNo

Mechanism of ActionDocetaxel promotes the assembly of microtubules from tubulin dimers, and inhibits the depolymerization of tubulin which stabilizes microtubules in the cell. This results in inhibition of DNA, RNA, and protein synthesis. Most activity occurs during the M phase of the cell cycle.

Pharmacodynamics/KineticsExhibits linear pharmacokinetics at the recommended dosage range

Distribution: Extensive extravascular distribution and/or tissue binding; V_d: 80-90 L/m^2, V_{dss}: 113 L (mean steady state)

Protein binding: ~94% to 97%, primarily to alpha$_1$-acid glycoprotein, albumin, and lipoproteins

Metabolism: Hepatic; oxidation via CYP3A4 to metabolites

Half-life elimination: Terminal: 11 hours

Excretion: Feces (75%, <8% as unchanged drug); urine (6%); ~80% within 48 hours

Clearance: Total body: Mean: 21 L/hour/m^2

Related Information

- Safe Handling of Hazardous Drugs

Pharmacotherapy PearlsPremedication with oral corticosteroids is recommended to decrease the incidence and severity of fluid retention and severity of hypersensitivity reactions. Dexamethasone 8-10 mg orally twice daily for 3-5 days, starting the day before docetaxel administration, is usually recommended. When prednisone is part of the antineoplastic regimen (eg, prostate cancer), the prednisone is sometimes withheld on the days dexamethasone is administered.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Mucositis, stomatitis, and taste perversion.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause confusion

Mental Health: Effects on Psychiatric TreatmentMay cause leukopenia; use caution with clozapine and carbamazepine

Index TermsNSC-628503; RP-6976

Docosanol

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(doe KOE san ole)
U.S. Brand NamesAbreva® [OTC]
Pharmacologic CategoryAntiviral Agent, Topical
Use: Labeled IndicationsTreatment of herpes simplex of the face or lips
Use: DentalTreatment of herpes simplex of the face or lips
Dosing: AdultsHerpes simplex (face/lips): Topical: Apply 5 times/day to affected area of face or lips. Start at first sign of cold sore or fever blister and continue until healed.
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricHerpes simplex: Children ≥12 years: Refer to adult dosing.
StorageStore at 20°C to 25°C (68°F to 77°F); do not freeze.
ContraindicationsHypersensitivity to docosanol or any component of the formulation
Warnings/Precautions

Special populations:

- Pediatrics: Not for use in children <12 years of age.

Other warnings/precautions:

- Appropriate use: For external use only; do not apply to inside of mouth or around eyes.

Adverse ReactionsLimited information; headache reported (frequency similar to placebo)
Drug InteractionsThere are no known significant interactions.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Cream, topical:

Abreva®: 10% (2 g) [contains benzyl alcohol]

Generic AvailableNo
Mechanism of ActionPrevents viral entry and replication at the cellular level
Dental Health Professional ConsiderationsWash hands before and after applying cream. Begin treatment at first tingle of cold sore or fever blister. Rub into area gently, but completely. Do not apply directly to inside of mouth or around eyes. Contact healthcare provider if sore gets worse or does not heal within 10 days. Do not share this product with others, may spread infection. Notify healthcare professional if pregnant or breast-feeding.
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported (see Dental Comment)
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported
Anesthesia and Critical Care Concerns/Other ConsiderationsDo not apply directly to inside of mouth or around eyes.

Medication Safety Issues

Sound-alike/look-alike issues:

Senokot® may be confused with Depakote®

Pronunciation(DOK yoo sate & SEN na)
U.S. Brand NamesPeri-Colace® [OTC]; Senokot-S® [OTC]; SenoSol™-SS [OTC]
Pharmacologic CategoryLaxative, Stimulant; Stool Softener
Use: Labeled IndicationsShort-term treatment of constipation
Use: Unlabeled/InvestigationalEvacuate the colon for bowel or rectal examinations; management/prevention of opiate-induced constipation
Dosing: AdultsConstipation: OTC ranges: Oral: Initial: 2 tablets (17.2 mg sennosides plus 100 mg docusate) once daily (maximum: 4 tablets twice daily)
Dosing: ElderlyConstipation: OTC ranges: Oral: Consider half the initial dose in older, debilitated patients
Dosing: PediatricConstipation: OTC ranges: Oral: Children:

2-6 years: Initial: 4.3 mg sennosides plus 25 mg docusate ($^1/_2$ tablet) once daily (maximum: 1 tablet twice daily)

6-12 years: Initial: 8.6 sennosides plus 50 mg docusate (1 tablet) once daily (maximum: 2 tablets twice daily)

≥12 years: Refer to adult dosing.

Administration: OralOnce-daily doses should be taken at bedtime.
Dietary ConsiderationsSenokot-S®: Sodium content: 3 mg per tablet
ContraindicationsHypersensitivity to any component; intestinal obstruction; acute intestinal inflammation (eg, Crohn's disease); ulcerative colitis; appendicitis; abdominal pain of unknown origin; concurrent use of mineral oil; pregnancy (per Commission E for senna)
Allergy Considerations

- Anthraquinone Allergy

Warnings/Precautions

Other warnings/precautions:

- OTC labeling: Not recommended for over-the-counter (OTC) use in patients experiencing stomach pain, nausea, vomiting, or a sudden change in bowel movements which lasts >2 weeks. Not recommended for use longer than 1 week. Not recommended for use in children <2 years of age.

Geriatric ConsiderationsThe chronic use of stimulant cathartics is inappropriate and should be avoided. Although the elderly commonly complain of constipation, such complaints require evaluation; short-term use of stimulant cathartics is best. If prophylaxis is desired, then the use of bulk agents (eg, psyllium), stool softeners, and hyperosmotic agents (eg, sorbitol 70%) is preferred. Stool softeners are unnecessary if stools are well-hydrated (as in use of hyperosmotics), soft or “mushy”. Patients should be instructed for proper dietary fiber and fluid intake, as well as regular exercise. Monitor closely for fluid/electrolyte imbalance, CNS signs of fluid/electrolyte loss, and hypotension.
Adverse ReactionsFrequency not defined.

Gastrointestinal: Nausea, vomiting, diarrhea, abdominal cramps

Genitourinary: Urine discoloration (red/brown)

Nursing: Physical Assessment/MonitoringSee individual agents.
Patient EducationSee individual agents.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: Docusate sodium 50 mg and sennosides 8.6 mg

Peri-Colace®: Docusate sodium 50 mg and sennosides 8.6 mg

Senokot-S®: Docusate sodium 50 mg and sennosides 8.6 mg [sugar free; contains sodium 4 mg/tablet]

SenoSol™-SS: Docusate sodium 50 mg and sennosides 8.6 mg [contains sodium 3 mg/tablet]

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Tablets (Senna S)

8.6-50 mg (100): $12.99

Mechanism of ActionDocusate is a stool softener; sennosides are laxatives
Pharmacotherapy PearlsIndividual product labeling should be consulted prior to dosing.
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentGI side effects are common; use caution with SSRIs

Medication Safety Issues

Sound-alike/look-alike issues:

Colace® may be confused with Calan®, Cozaar®

Docusate may be confused with Doxinate®

Surfak® may be confused with Surbex®

Pronunciation(DOK yoo sate)

U.S. Brand NamesColace® [OTC]; Correctol® [OTC]; D-S-S® [OTC]; Diocto® [OTC]; Docu-Soft [OTC]; Docusoft-S™ [OTC]; DOK™ [OTC]; DOS® [OTC]; Dulcolax® Stool Softener [OTC]; Enemeez® Plus [OTC]; Enemeez® [OTC]; Fleet® Sof-Lax® [OTC]; Genasoft® [OTC]; Phillips'® Stool Softener Laxative [OTC]; Silace [OTC]; Surfak® [OTC]

Canadian Brand NamesApo-Docusate-Sodium®; Colace®; Colax-C®; Novo-Docusate Calcium; Novo-Docusate Sodium; PMS-Docusate Calcium; PMS-Docusate Sodium; Regulex®; Selax®; Soflax™

Pharmacologic CategoryStool Softener

Use: Labeled IndicationsStool softener in patients who should avoid straining during defecation and constipation associated with hard, dry stools; prophylaxis for straining (Valsalva) following myocardial infarction. A safe agent to be used in elderly; some evidence that doses <200 mg are ineffective; stool softeners are unnecessary if stool is well hydrated or "mushy" and soft; shown to be ineffective used long-term.

Use: Unlabeled/InvestigationalCeruminolytic

Dosing: Adults**Note:** Docusate salts are interchangeable; the amount of sodium, calcium, or potassium per dosage unit is clinically insignificant.

Stool softener:

Oral: 50-500 mg/day in 1-4 divided doses

Rectal: Add 50-100 mg of docusate liquid to enema fluid (saline or water); give as retention or flushing enema

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** Docusate salts are interchangeable; the amount of sodium, calcium, or potassium per dosage unit is clinically insignificant.

Stool softener:

Oral:

- Infants and Children <3 years: 10-40 mg/day in 1-4 divided doses
- Children:
    - 3-6 years: 20-60 mg/day in 1-4 divided doses
    - 6-12 years: 40-150 mg/day in 1-4 divided doses
- Adolescents: Refer to adult dosing.

Rectal: Older Children: Refer to adult dosing.

Administration: OralEnsure adequate fluid intake. Docusate syrup should be administered with 6-8 ounces of milk, juice, or infant formula to mask the bitter taste.

Dietary ConsiderationsEnsure adequate fluid intake.

Syrup: Should be taken with 6-8 ounces of milk, juice, or infant formula.

ContraindicationsHypersensitivity to docusate or any component of the formulation; concomitant use of mineral oil; intestinal obstruction, acute abdominal pain, nausea, or vomiting

Warnings/Precautions

Concerns related to adverse effects:

- Dependence: Prolonged, frequent or excessive use may result in dependence.
- Electrolyte imbalance: Prolonged, frequent or excessive use may result in electrolyte imbalance.

Geriatric ConsiderationsA safe agent to be used in the elderly. Some evidence that doses <200 mg are ineffective. Stool softeners are unnecessary if stool is well hydrated or “mushy” and soft; shown to be ineffective used long-term.

Pregnancy Risk FactorC

LactationExcretion in breast milk unknown/compatible

Adverse Reactions1% to 10%:

Gastrointestinal: Intestinal obstruction, diarrhea, abdominal cramping

Miscellaneous: Throat irritation

Drug InteractionsThere are no known significant interactions.

Test InteractionsDecreased potassium (S), decreased chloride (S)

Nursing: Physical Assessment/MonitoringMonitor for effectiveness and instruct patient in proper use (avoid excessive or prolonged use) and adverse effects to report.

Patient EducationMaintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Do not chew or break caplets; swallow whole. Docusate should be taken with a full (6-8 oz) glass of milk, fruit juice, or infant formula. Do not use if abdominal pain, nausea, or vomiting are present. Laxative use should be used for a short period of time (<1 week). Prolonged use may result in abuse, dependence, as well as fluid and electrolyte loss. Report bleeding or constipation. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Capsule, oral, as calcium: 240 mg

Capsule, oral, as sodium: 100 mg, 250 mg [DSC]

Colace®: 50 mg [contains sodium 3 mg/capsule]; 100 mg [contains sodium 5 mg/capsule]

Capsule, liquid, oral, as calcium:

Surfak®: 240 mg

Capsule, liquid, oral, as sodium:

Docusoft-S™: 100 mg [contains sodium 5 mg/capsule]

Capsule, softgel, oral, as calcium: 240 mg

Capsule, softgel, oral, as sodium: 100 mg, 250 mg

Correctol®: 100 mg

Docu-Soft: 100 mg

DOK™: 100 mg, 250 mg

Dulcolax® Stool Softener: 100 mg [contains sodium 5 mg/softgel]

Fleet® Sof-Lax®: 100 mg [contains sodium 5 mg/softgel]

DOS®, D-S-S®: 100 mg, 250 mg

Genasoft®: 100 mg

Phillips'® Stool Softener Laxative: 100 mg [contains sodium 5.2 mg/softgel]

Liquid, oral, as sodium: 150 mg/15 mL (480 mL)

Colace®: 150 mg/15 mL (30 mL) [contains propylene glycol, sodium 1 mg/mL]

Diocto®: 150 mg/15 mL (480 mL)

Silace: 150 mg/15 mL (480 mL) [lemon-vanilla flavor]

Solution, rectal, as sodium [enema]:

Enemeez®: 283 mg/5 mL

Enemeez® Plus: 283 mg/5 mL [contains benzocaine]

Syrup, oral, as sodium: 60 mg/15 mL (480 mL)

Colace®: 60 mg/15 mL (480 mL) [alcohol free, sugar free; contains sodium 36 mg/5 mL]

Diocto®: 60 mg/15 mL (480 mL)

Silace: 20 mg/5 mL (480 mL) [peppermint flavor]

Generic AvailableYes: Excludes gelcap

Pricing: U.S. (www.drugstore.com)

Capsules (Colace)

100 mg (60): $25.99

Capsules (Docusate Sodium)

100 mg (100): $11.99

250 mg (100): $13.99

Syrup (Doc-Q-Lace)

60 mg/15 mL (473): $8.99

Mechanism of ActionReduces surface tension of the oil-water interface of the stool resulting in enhanced incorporation of water and fat allowing for stool softening

Pharmacodynamics/Kinetics

Onset of action: 12-72 hours

Excretion: Feces

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(doe FET il ide)

U.S. Brand NamesTikosyn®

Canadian Brand NamesTikosyn®

Pharmacologic CategoryAntiarrhythmic Agent, Class III

Use: Labeled IndicationsMaintenance of normal sinus rhythm in patients with chronic atrial fibrillation/atrial flutter of longer than 1-week duration who have been converted to normal sinus rhythm; conversion of atrial fibrillation and atrial flutter to normal sinus rhythm

Dosing: Adults **Note:** QT_c must be determined prior to first dose

Antiarrhythmic: Oral:

Initial: 500 mcg orally twice daily. Initial dosage must be adjusted in patients with estimated Cl_{cr} <60 mL/minute. Dofetilide may be initiated at lower doses than recommended based on physician discretion.

Modification of dosage in response to initial dose: QT_c interval should be measured 2-3 hours after the initial dose. If the QT_c >15% of baseline, or if the QT_c is >500 msec (550 msec in patients with ventricular conduction abnormalities), dofetilide should be adjusted. If the starting dose is 500 mcg twice daily, then adjust to 250 mcg twice daily. If the starting dose was 250 mcg twice daily, then adjust to 125 mcg twice daily. If the starting dose was 125 mcg twice daily, then adjust to 125 mcg every day.

Continued monitoring for doses 2-5: QT_c interval must be determined 2-3 hours after each subsequent dose of dofetilide for in-hospital doses 2-5. If the measured QT_c is >500 msec (550 msec in patients with ventricular conduction abnormalities) dofetilide should be stopped.

Dosing: ElderlyRefer to adult dosing. No specific dosage adjustments are recommended based on age; however, careful assessment of renal function is particularly important in this population. See Special Geriatric Considerations.

Dosing: Renal Impairment

Cl_{cr} >60 mL/minute: Administer 500 mcg twice daily.

Cl_{cr} 40-60 mL/minute: Administer 250 mcg twice daily.

Cl_{cr} 20-39 mL/minute: Administer 125 mcg twice daily.

Cl_{cr} <20 mL/minute: Contraindicated in this group

Dosing: Hepatic ImpairmentNo dosage adjustments required in Child-Pugh class A and B; patients with severe hepatic impairment were not studied.

Calculations

- Creatinine Clearance: Adults

Administration: OralDo not open capsules.

RestrictionsTikosyn® is only available to prescribers and hospitals that have confirmed their participation in a designated Tikosyn® Education Program. The program provides comprehensive education about the importance of in-hospital treatment initiation and individualized dosing.

T.I.P.S. is the Tikosyn® In Pharmacy System designated to allow retail pharmacies to stock and dispense Tikosyn® once they have been enrolled. A participating pharmacy must confirm receipt of the T.I.P.S. program materials and educate its pharmacy staff about the procedures required to fill an outpatient prescription for Tikosyn®. The T.I.P.S. enrollment form is available at www.tikosyn.com. Tikosyn® is only available from a special mail order pharmacy, and enrolled retail pharmacies. Pharmacists must verify that the hospital/prescriber is a confirmed participant before Tikosyn® is provided. For participant verification, the pharmacist may call 1-800-788-7353 or use the web site located at www.tikosynlist.com. Further details and directions on the program are provided at www.tikosyn.com.

Dofetilide therapy must be initiated/adjusted in a hospital setting with proper monitoring under the guidance of experienced personnel.

ContraindicationsHypersensitivity to dofetilide or any component of the formulation; patients with congenital or acquired long QT syndromes, do not use if a baseline QT interval or QT_c is >440 msec (500 msec in patients with ventricular conduction abnormalities); severe renal impairment (estimated Cl_{cr} <20 mL/minute); concurrent use with verapamil, cimetidine, hydrochlorothiazide (alone or in combinations), trimethoprim (alone or in combination with sulfamethoxazole), itraconazole, ketoconazole, prochlorperazine, or megestrol; baseline heart rate <50 beats/minute; other drugs that prolong QT intervals (phenothiazines, cisapride, bepridil, tricyclic antidepressants, moxifloxacin; hypokalemia or hypomagnesemia; concurrent amiodarone, clarithromycin, or erythromycin

Allergy Considerations

- Dofetilide Allergy

Warnings/Precautions

Boxed warnings:

- Arrhythmias: Appropriate use: See “Other warnings/precautions” below.

Concerns related to adverse effects:

- Proarrhythmic effects: Watch for proarrhythmic effects; monitor and adjust dose to prevent QT_c prolongation. Torsade de pointes significantly increases with doses >500 mcg twice daily.

Disease-related concerns:

- Arrhythmias: Appropriate use: Reserve for patients who are highly symptomatic with atrial fibrillation/atrial flutter. **[U.S. Boxed Warning]: Must be initiated (or reinitiated) in a setting with continuous monitoring and staff familiar with the recognition and treatment of life-threatening arrhythmias. Patients must be monitored with continuous ECG for a minimum of 3 days,** or for a minimum of 12 hours after electrical or pharmacological cardioversion to normal sinus rhythm, whichever is greater. Patients should be readmitted for continuous monitoring if dosage is later increased.

- Conduction disturbances: Patients with second or third-degree heart block and/or sick sinus syndrome should not receive unless a functional pacemaker is in place. Defibrillation threshold is reduced in patients with ventricular tachycardia or ventricular fibrillation undergoing implantation of a cardioverter-defibrillator device.

- Electrolyte imbalance: Correct electrolyte disturbances, especially hypokalemia or hypomagnesemia, prior to use and throughout therapy.

- Hepatic impairment: Use with caution in patients with severe hepatic impairment.

- Renal impairment: Use with caution in patients with renal impairment.

Concurrent drug therapy issues:

- Drugs with QT prolongation potential: Concurrent use with other drugs known to prolong QT_c interval is not recommended. Hold class I or class III antiarrhythmics for at least three half-lives prior to starting dofetilide; use in patients on amiodarone therapy only if serum amiodarone level is <0.3 mg/L or if amiodarone was stopped for >3 months previously.

- Potassium-depleting diuretics: Risk of hypokalemia and/or hypomagnesemia may be increased by potassium-depleting diuretics, increasing the risk of malignant arrhythmias such as torsade de pointes.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- CAST trial: In the Cardiac Arrhythmia Suppression Trial (CAST), recent (>6 days but <2 years ago) myocardial infarction patients with asymptomatic, non-life-threatening ventricular arrhythmias did not benefit and may have been harmed by attempts to suppress the arrhythmia with flecainide or encainide. An increased mortality or nonfatal cardiac arrest rate (7.7%) was seen in the active treatment group compared with patients in the placebo group (3%). The applicability of the CAST results to other populations is unknown. Antiarrhythmic agents should be reserved for patients with life-threatening ventricular arrhythmias.

Geriatric ConsiderationsNo specific dosage adjustments are recommended based on age; however, evaluation for use of this drug in the elderly is imperative. A complete review of medications, to assure there is no inadvertent use of contraindicated medications and those with potential drug interactions, can be re-evaluated for continued need. Laboratory values must be assessed prior to initiating medication; careful assessment of renal function is particularly important in the elderly population.

Pregnancy Risk FactorC

Pregnancy ConsiderationsDofetilide has been shown to adversely affect *in utero* growth, organogenesis, and survival of rats and mice. There are no adequate and well-controlled studies in pregnant women. Dofetilide should be used with extreme caution in pregnant women and in women of childbearing age only when the benefit to the patient unequivocally justifies the potential risk to the fetus.

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions

Supraventricular arrhythmia patients (incidence > placebo)

>10%: Central nervous system: Headache (11%)

2% to 10%:

Central nervous system: Dizziness (8%), insomnia (4%)

Cardiovascular: Ventricular tachycardia (2.6% to 3.7%), chest pain (10%), torsade de pointes (3.3% in CHF patients and 0.9% in patients with a recent MI; up to 10.5% in patients receiving doses in excess of those recommended). Torsade de pointes occurs most frequently within the first 3 days of therapy.

Dermatologic: Rash (3%)

Gastrointestinal: Nausea (5%), diarrhea (3%), abdominal pain (3%)

Neuromuscular & skeletal: Back pain (3%)

Respiratory: Dyspnea (6%), respiratory tract infection (7%)

Miscellaneous: Flu syndrome (4%)

<2%:

Central nervous system: CVA, facial paralysis, flaccid paralysis, migraine, paralysis

Cardiovascular: AV block (0.4% to 1.5%), ventricular fibrillation (0% to 0.4%), bundle branch block, heart block, edema, heart arrest, myocardial infarct, sudden death, syncope

Dermatologic: Angioedema

Gastrointestinal: Liver damage

Neuromuscular & skeletal: Paresthesia

Respiratory: Cough

>2% (incidence ≤ placebo): Anxiety, pain, angina, atrial fibrillation, hypertension, palpitation, supraventricular tachycardia, peripheral edema, urinary tract infection, weakness, arthralgia, diaphoresis

Metabolism/Transport Effects**Substrate** of CYP3A4 (minor)

Drug Interactions

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Dofetilide. *Risk X: Avoid combination*

Cimetidine: May decrease the excretion of Dofetilide. Cimetidine may decrease the metabolism of Dofetilide. *Risk D: Consider therapy modification*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Loop Diuretics: May enhance the QTc-prolonging effect of Dofetilide. *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thiazide Diuretics: May enhance the QTc-prolonging effect of Dofetilide. Thiazide Diuretics may increase the serum concentration of Dofetilide. *Risk D: Consider therapy modification*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Trimethoprim: May decrease the excretion of Dofetilide. *Risk X: Avoid combination*

Verapamil: May increase the serum concentration of Dofetilide. *Risk X: Avoid combination*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: St John's wort may decrease dofetilide levels. Avoid ephedra (may worsen arrhythmia).

Monitoring ParametersECG monitoring with attention to QT_c and occurrence of ventricular arrhythmias, baseline serum creatinine and changes in serum creatinine. Check serum potassium and magnesium levels if on medications where these electrolyte disturbances can occur, or if patient has a history of hypokalemia or hypomagnesemia. QT or QT_c must be monitored at specific times prior to the first dose and during the first 3 days of therapy. Thereafter, QT or QT_c and creatinine clearance must be evaluated at 3-month intervals.

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Must be initiated or reinitiated by a cardiologist in a setting with continuous ECG monitoring for a period of time at beginning or adjustment of therapy. Monitor for signs of electrolyte imbalance. Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions at beginning of therapy and on a regular basis with long-term therapy. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse reactions to report.

Monitoring: Lab TestsSerum creatinine; check serum potassium and magnesium levels if on medications where these electrolyte disturbances can occur, or if patient has a history of hypokalemia or hypomagnesemia.

Patient EducationTake exactly as directed; do not take additional doses or discontinue without consulting prescriber. Do not open capsules. If you miss a dose, take your normal amount at the next scheduled time. You will need regular cardiac checkups and blood tests when taking this medication. You may experience headache, dizziness, or difficulty sleeping (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or abdominal pain, diarrhea, or nausea (small frequent meals and increased dietary bulk may help). Inform prescriber immediately if you experience fainting; severe GI discomfort or diarrhea; chest palpitations, irregular heartbeat, or chest pain; increased thirst; respiratory difficulty; skin rash; back pain; or alteration in muscle strength or gait. **Pregnancy/breast-feeding precautions:** Inform your prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 125 mcg, 250 mcg, 500 mcg

Generic AvailableNo
ManufacturerPfizer U.S. Pharmaceuticals Group
Pricing: U.S. (www.drugstore.com)

Capsules (Tikosyn)

500 mcg (60): $176.76

Mechanism of ActionVaughan Williams Class III antiarrhythmic activity. Blockade of the cardiac ion channel carrying the rapid component of the delayed rectifier potassium current. Dofetilide has no effect on sodium channels, adrenergic alpha-receptors, or adrenergic beta-receptors. It increases the monophasic action potential duration due to delayed repolarization. The increase in the QT interval is a function of prolongation of both effective and functional refractory periods in the His-Purkinje system and the ventricles. Changes in cardiac conduction velocity and sinus node function have not been observed in patients with or without structural heart disease. PR and QRS width remain the same in patients with pre-existing heart block and or sick sinus syndrome.
Pharmacodynamics/Kinetics

Absorption: >90%

Distribution: V_d: 3 L/kg

Protein binding: 60% to 70%

Metabolism: Hepatic via CYP3A4, but low affinity for it; metabolites formed by N-dealkylation and N-oxidation

Bioavailability: >90%

Half-life elimination: 10 hours

Time to peak: Fasting: 2-3 hours

Excretion: Urine (80%, 80% as unchanged drug, 20% as inactive or minimally active metabolites); renal elimination consists of glomerular filtration and active tubular secretion via cationic transport system

Related Information

- Antiarrhythmic Drugs

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsDofetilide is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution.
Mental Health: Effects on Mental StatusInsomnia is common
Mental Health: Effects on Psychiatric TreatmentContraindicated with drugs that prolong QT_c (phenothiazines, TCAs, ziprasidone)
Cardiovascular ConsiderationsThe management of atrial fibrillation deserves careful consideration in patients with heart failure, because the loss of atrial assistance to ventricular filling may have greater negative effects on cardiac output. The choice of antiarrhythmic is important because of the risk that antiarrhythmic therapy may increase mortality in this setting.

The two DIAMOND studies were 3-year trials comparing mortality between dofetilide and placebo in patients with left ventricular dysfunction. One study included patients with moderate to severe CHF (60% of participants were NYHA Class III or IV) and the other study looked at patients with a recent MI (40% had NYHA class III or IV CHF). Dofetilide was an effective therapy for atrial fibrillation in carefully selected and monitored heart failure patients. Mortality was similar between those who received placebo and dofetilide; fewer patients on dofetilide were hospitalized for heart failure. It seems prudent, therefore, to carefully select and monitor patients in this situation.

There are limited studies evaluating the efficacy of dofetilide in patients with paroxysmal atrial fibrillation (PAF). While the efficacy data have not been statistically significant, positive trends have been noted and further study is required. In heart failure patients, dofetilide has been reported to preserve inotropic and end-systolic indices. Considering the neutral survival data from the DIAMOND trials and the positive influence on hemodynamic function, dofetilide is recommended by the most recently published ACC/AHA/ESC guidelines as an appropriate second- or third-line agent for PAF, particularly in the setting of ventricular dysfunction.

Dofetilide can cause life-threatening ventricular arrhythmias and should therefore be used in select patients in whom atrial fibrillation/flutter is highly symptomatic. Hospitals and physicians need to complete their Tikosyn® educational program before dofetilide can be prescribed and dispensed.

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Anzemet® may be confused with Aldomet® and Avandamet®

Dolasetron may be confused with granisetron, ondansetron, palonosetron

Pronunciation(dol A se tron)

U.S. Brand NamesAnzemet®

Canadian Brand NamesAnzemet®

Pharmacologic CategoryAntiemetic; Selective 5-HT$_3$ Receptor Antagonist

Use: Labeled IndicationsPrevention of nausea and vomiting associated with emetogenic cancer chemotherapy; prevention of postoperative nausea and vomiting; treatment of postoperative nausea and vomiting (injectable form only).

Note: In Canada, the use of dolasetron is contraindicated for all uses in children <18 years of age or in the treatment of postoperative nausea and vomiting in adults. These are not labeled contraindications in the U.S.

Dosing: Adults**Note:** In Canada, the use of dolasetron is contraindicated in the treatment of postoperative nausea and vomiting in adults. These are not labeled contraindications in the U.S.

Prevention of chemotherapy-associated nausea and vomiting:

Oral:100 mg single dose 1 hour prior to chemotherapy

I.V.: 1.8 mg/kg or 100 mg 30 minutes prior to chemotherapy

Postoperative nausea and vomiting:

Prevention:

Oral: 100 mg within 2 hours before surgery (doses of 25-200 mg have been used)

I.V.: 12.5 mg ~15 minutes before stopping anesthesia

Treatment: I.V. (only): 12.5 mg as soon as needed

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** In Canada, the use of dolasetron is contraindicated in children <18 years of age.
Prevention of chemotherapy-associated nausea and vomiting (including initial and repeat courses): Children 2-16 years:

Oral: 1.8 mg/kg within 1 hour before chemotherapy; maximum: 100 mg/dose

I.V.: 1.8 mg/kg ~30 minutes before chemotherapy; maximum: 100 mg/dose

Postoperative nausea and vomiting: Children 2-16 years:

Prevention:

Oral: 1.2 mg/kg within 2 hours before surgery; maximum: 100 mg/dose

I.V.: 0.35 mg/kg (maximum: 12.5 mg) ~15 minutes before stopping anesthesia

Treatment: I.V. (only): 0.35 mg/kg as soon as needed

Administration: I.V.I.V. injection may be given either undiluted IVP over 30 seconds or diluted in 50 mL of compatible fluid and infused over 15 minutes. Line should be flushed, prior to and after, dolasetron administration.

Administration: I.V. DetailpH: 3.2-3.8

Administration: OralDolasetron injection may be diluted in apple or apple-grape juice and taken orally; this dilution is stable for 2 hours at room temperature.

StorageStore intact vials and tablets at room temperature. Protect from light. A 20 mg/mL solution in syringes is stable for 8 months at room temperature. Solutions diluted for infusion are stable at room temperature for 24 hours or under refrigeration for 48 hours.

ReconstitutionDilute in 50-100 mL of a compatible solution (ie, 0.9% NS, D_5W, $D_5{}^1/_2NS$, D_5LR, LR, and 10% mannitol injection).

CompatibilityStable in 0.9% NS, D_5W, $D_5{}^1/_2NS$, D_5LR, LR, and 10% mannitol injection.

Extemporaneously PreparedDolasetron injection may be diluted in apple or apple-grape juice and taken orally; this dilution is stable for 2 hours at room temperature.

ContraindicationsHypersensitivity to dolasetron or any component of the formulation

Note: In Canada, the use of dolasetron is contraindicated for all uses in children <18 years of age or in the treatment of postoperative nausea and vomiting in adults. These are not labeled contraindications in the U.S.

Allergy Considerations

- Serotonin 5-HT$_3$ Antagonist Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Allergic reactions: Use with caution in patients allergic to other 5-HT$_3$ receptor antagonists; cross-reactivity has been reported.

- ECG effects: Dolasetron has been associated with a number of dose-dependent increases in ECG intervals (eg, PR, QRS duration, QT/QT$_c$, JT), usually occurring 1-2 hours after I.V. administration and lasting 6-8 hours; however, may last ≥24 hours. May rarely lead to heart block or arrhythmia. Clinically relevant QT interval prolongation may occur resulting in torsade de pointes, when used in conjunction with other agents that prolong the QT interval (eg, Class I and III antiarrhythmics). Use with caution in patients at risk of QT prolongation and/or ventricular arrhythmia. Reduction in heart rate may also occur with the 5-HT$_3$ antagonists. I.V. formulations of 5-HT$_3$ antagonists have more association with ECG interval changes, compared to oral formulations.

Disease-related concerns:

- Long QT syndrome: Use with caution in patients with congenital long QT syndrome or other risk factors for QT prolongation (eg, medications known to prolong QT interval, electrolyte abnormalities [hypokalemia or hypomagnesemia], and cumulative high-dose anthracycline therapy).

Special populations:

- Pediatrics: Use with caution in children and adolescents who have or may develop QT$_c$ prolongation; rare cases of supraventricular and ventricular arrhythmias, cardiac arrest, and MI have been reported in this population. Safety and efficacy have not been established in children <2 years of age.

Other warnings/precautions:

- Chemotherapy-related emesis: **For chemotherapy, should be used on a scheduled basis, not on an "as needed" (PRN) basis,** since data support the use of this drug only in the prevention of nausea and vomiting (due to antineoplastic therapy) and not in the rescue of nausea and vomiting. Not intended for treatment of nausea and vomiting or for chronic continuous therapy.

Geriatric ConsiderationsIn controlled trials, no difference in overall safety and efficacy were observed between elderly and younger adults. Pharmacokinetics are similar in younger adults and elderly. No dosage adjustment necessary.

Pregnancy Risk FactorB

Pregnancy Considerations

Teratogenic effects were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsAdverse events may vary according to indication

>10%:

Central nervous system: Headache (7% to 24%)

Gastrointestinal: Diarrhea (2% to 12%)

1% to 10%:

Cardiovascular: Bradycardia (4% to 5%), hypotension (5%), hypertension (2% to 3%), tachycardia (2% to 3%)

Central nervous system: Dizziness (1% to 6%), fatigue (3% to 6%), fever (4% to 5%), pain (≤3%), chills/shivering (1% to 2%), sedation (2%)

Dermatological: Pruritus (3% to 4%)

Gastrointestinal: Dyspepsia (2% to 3%), abdominal pain (≤3%)

Hepatic: Abnormal hepatic function (4%)

Neuromuscular & skeletal: Pain (3%)

Renal: Oliguria (1% to 3%)

<1% (Limited to important or life-threatening): Abnormal vision, abnormal dreaming, acute renal failure, alkaline phosphatase increased, ALT increased, anaphylactic reaction, anemia, anorexia, anxiety, arrhythmia (supraventricular and ventricular), AST increased, ataxia, AV block, bronchospasm, cardiac arrest, cardiac conduction abnormalities, chest pain, confusion, constipation, diaphoresis, dyspnea, dysuria, edema, epistaxis, facial edema, flushing, GGT increased, heart block, hematuria, hyperbilirubinemia, ischemia (peripheral), local injection site reaction, MI, myocardial ischemia, orthostatic hypotension, palpitation, pancreatitis, paresthesia, peripheral edema, photophobia, polyuria; prolonged PR, QRS, JT, and QT$_c$ intervals; prothrombin time increased, PTT increased, purpura/hematoma, rash, sleep disorder, syncope, taste perversion, thrombocytopenia, thrombophlebitis/phlebitis, tinnitus, tremor, twitching, urticaria, vertigo

Oncology: VesicantNo

Metabolism/Transport Effects**Substrate** (minor) of CYP2C9, 3A4; **Inhibits** CYP2D6 (weak)

Drug Interactions

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Apomorphine: Antiemetics (5HT3 Antagonists) may enhance the hypotensive effect of Apomorphine. *Risk X: Avoid combination*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Monitoring ParametersLiver function tests, blood pressure and pulse, and ECG in patients with cardiovascular disease

Nursing: Physical Assessment/MonitoringAssess allergy history (selective 5-HT$_3$ receptor antagonists) prior to administering. Use with caution in presence of, or potential for, cardiac conduction abnormalities (eg, QT prolongation, medication known to prolong QT interval, electrolyte abnormalities). I.V.: Follow infusion specifics. **Note:** Oral and I.V. doses have different schedules and should not be administered on "PRN" basis. Assess therapeutic effectiveness and adverse reactions on a regular basis. Teach patient possible side effects and adverse symptoms to report.

Patient EducationThis drug is given to reduce the incidence of nausea and vomiting. Do not take any other medication for nausea and vomiting with this medication unless approved by prescriber. If this medication is given by intravenous infusion you will be monitored during infusion. Report immediately any chest pain, respiratory difficulty, pain or itching at infusion site. Self-administered oral doses must be taken exactly as directed. You may experience headache, drowsiness, or dizziness (request assistance when getting up or changing position and do not perform activities requiring alertness [including driving] until response to drug is known). Report chest pain or palpitations; persistent headache; excessive drowsiness; fever; or changes in elimination patterns (constipation or diarrhea) or other adverse effects. **Breast-feeding precaution:** Consult prescriber if you are or intend to breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as mesylate:

Anzemet®: 20 mg/mL (0.625 mL) [single-use Carpuject® or vial; contains mannitol 38.2 mg/mL]; 20 mg/mL (5 mL) [single-use vial; contains mannitol 38.2 mg/mL]; 20 mg/mL (25 mL) [multidose vial; contains mannitol 29 mg/mL]

Tablet, as mesylate:

Anzemet®: 50 mg, 100 mg

Generic AvailableNo

ManufacturerSanofi-Aventis Pharmaceuticals, Inc

Pricing: U.S. (www.drugstore.com)

Tablets (Anzemet)

50 mg (5): $272.90

100 mg (5): $355.44

Mechanism of ActionSelective serotonin receptor (5-HT$_3$) antagonist, blocking serotonin both peripherally (primary site of action) and centrally at the chemoreceptor trigger zone

Pharmacodynamics/Kinetics

Absorption: Rapid and complete

Distribution: Hydrodolasetron: 5.8 L/kg

Protein binding: Hydrodolasetron: 69% to 77% (50% bound to alpha$_1$-acid glycoprotein)

Metabolism: Hepatic; reduction by carbonyl reductase to hydrodolasetron (active metabolite); further metabolized by CYP2D6, CYP3A, and flavin monooxygenase

Bioavailability: 75%

Half-life elimination: Dolasetron: 10 minutes; hydrodolasetron: Adults: 6-8 hours; Children: 4-6 hours

Time to peak, plasma: Hydrodolasetron: I.V.: 0.6 hours; Oral: 1 hour

Excretion: Urine ~67% (53% to 61% as active metabolite hydrodolasetron); feces ~33%

Pharmacotherapy PearlsEfficacy of dolasetron, for chemotherapy treatment, is enhanced with concomitant administration of dexamethasone 20 mg (increases complete response by 10% to 20%). Oral administration of the intravenous solution is equivalent to tablets.

A single I.V. dose of dolasetron mesylate (1.8 or 2.4 mg/kg) has comparable safety and efficacy to a single 32 mg I.V. dose of ondansetron in patients receiving cisplatin chemotherapy.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Taste alterations.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsDolasetron is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution.

Mental Health: Effects on Mental StatusMay cause drowsiness or dizziness

Mental Health: Effects on Psychiatric TreatmentContraindicated with ziprasidone

Anesthesia and Critical Care Concerns/Other ConsiderationsOral administration of the intravenous solution is equivalent to tablets.

Domperidone

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(dom PE ri done)

Canadian Brand NamesApo-Domperidone®; Dom-Domperidone; Novo-Domperidone; Nu-Domperidone; PHL-Domperidone; PMS-Domperidone; RAN™-Domperidone; ratio-Domperidone

Pharmacologic CategoryDopamine Antagonist; Gastrointestinal Agent, Prokinetic

Use: Labeled IndicationsSymptomatic management of upper GI motility disorders associated with chronic and subacute gastritis and diabetic gastroparesis; prevention of GI symptoms associated with use of dopamine-agonist anti-Parkinson agents

Dosing: Adults

GI motility disorders: Oral: 10 mg 3-4 times/day, 15-30 minutes before meals

Severe/resistant cases: 20 mg 3-4 times/day, 15-30 minutes before meals

Nausea/vomiting associated with dopamine-agonist anti-Parkinson agents: Oral: 20 mg 3-4 times/day

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentDecrease dose to 10-20 mg 1-2 times/day

Administration: OralIn GI motility disorders, administer 15-30 minutes prior to meals.

Dietary ConsiderationsIn GI motility disorders, should be taken 15-30 minutes prior to meals.

StorageStore at room temperature of 15°C to 30°C (59°F to 86°F). Protect from light and moisture.

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to domperidone or any component of the formulation; patients with GI hemorrhage, mechanical obstruction, or perforation; patients with prolactin-releasing pituitary tumor

Warnings/Precautions

Concerns related to adverse effects:

- Altered cardiac conduction: QT_c prolongation, life-threatening tachyarrhythmias, and cardiac arrest have been reported after use; these adverse effects may be precipitated in hypokalemic patients.
- Elevated prolactin levels: May increase prolactin levels (dose-dependent response); may be asymptomatic (clinical consequence of chronically-elevated prolactin is unknown) or may present symptomatically as galactorrhea, gynecomastia, amenorrhea, or impotence (reversible upon decreasing dose or discontinuing drug).

Disease-related concerns:

- Breast cancer: Use caution when administering to patients with a personal or family history of breast cancer.
- Hepatic impairment: Use with caution in patients with hepatic impairment.

Concurrent drug therapy issues:

- MAO inhibitors: Use with caution in patients concomitantly taking MAO inhibitors.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal studies have not shown drug-related teratogenic or primary embryotoxic effects on animal fetuses, however, comparative studies have not been done in humans. Use only when benefit outweighs potential risk in a pregnant woman.

LactationEnters breast milk/not recommended (AAP rates as “compatible”)

Breast-Feeding ConsiderationsDomperidone is excreted in low concentrations in breast milk, therefore, caution should be exercised when administered to a breast-feeding woman. Use in a breast-feeding woman is not recommended by the manufacturer; AAP rates as “compatible.”

Adverse Reactions

1% to 10%:

Central nervous system: Headache/migraine (1%); does not cross blood-brain barrier; fewer CNS effects compared to metoclopramide

Gastrointestinal: Xerostomia (2%)

<1%: Abdominal cramps, constipation, diarrhea, dizziness, dysuria, edema, extrapyramidal symptoms (EPS) rarely, galactorrhea, gynecomastia, heartburn, hot flashes, insomnia, irritability, nervousness, thirst, lethargy, leg cramps, mastalgia, menstrual irregularities, nausea, palpitation, prolactin increased, pruritus, rash, regurgitation, stomatitis, urinary frequency, urticaria, weakness

Metabolism/Transport Effects**Substrate** of CYP3A4 (minor)

Drug Interactions

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Monitoring ParametersAgitation, irritability, confusion, and rarely EPS

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Tablet: 10 mg [domperidone maleate 12.72 mg; not available in the U.S.]

ManufacturerPharmascience Inc (Canada)

Mechanism of ActionDomperidone has peripheral dopamine receptor blocking properties. It increases esophageal peristalsis and increases lower esophageal sphincter pressure, increases gastric motility and peristalsis, and enhances gastroduodenal coordination, therefore, facilitating gastric emptying and decreasing small bowel transit time.

Pharmacodynamics/Kinetics

Protein binding: 93%

Metabolism: Hepatic via N-dealkylation (CYP3A4) and hydroxylation

Half-life elimination: 7 hours

Time to peak serum concentration: 30 minutes

Excretion: Feces (66%); urine (31%)

Pharmacotherapy PearlsNot available in U.S.

The Food and Drug Administration (FDA) has issued a warning concerning the off-label use of domperidone to increase milk production in breast-feeding women. Domperidone is not available for any use in the United States and does not have approval for this indication in other countries. However, the FDA is aware that women are obtaining domperidone from U.S. compounding pharmacies and foreign sources for this purpose. The FDA notes that there are health risks associated with the use of this product that is why it has been removed from marketing.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsDomperidone is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution.

Index TermsDomperidone Maleate

Medication Safety Issues

Sound-alike/look-alike issues:

Aricept® may be confused with AcipHex®, Ascriptin®, and Azilect®

Pronunciation(doh NEP e zil)
U.S. Brand NamesAricept®; Aricept® ODT
Canadian Brand NamesAricept®; Aricept® RDT
Pharmacologic CategoryAcetylcholinesterase Inhibitor (Central)
Use: Labeled IndicationsTreatment of mild, moderate, or severe dementia of the Alzheimer's type
Use: Unlabeled/InvestigationalAttention-deficit/hyperactivity disorder (ADHD); behavioral syndromes in dementia; mild-to-moderate dementia associated with Parkinson's disease; Lewy body dementia
Dosing: AdultsAlzheimer's disease: Oral: Initial: 5 mg/day at bedtime; may increase to 10 mg/day at bedtime after 4-6 weeks.
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricADHD (unlabeled use): Oral: 5 mg/day
Administration: OralAdminister at bedtime without regard to food.

Aricept® ODT: Allow tablet to dissolve completely on tongue and follow with water.

Dietary ConsiderationsMay take with or without food.
StorageStore at 15°C to 30°C (59°F to 86°F).
ContraindicationsHypersensitivity to donepezil, piperidine derivatives, or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Diarrhea: May cause diarrhea which may be dose-related; usually resolves in 1-3 weeks.
- Nausea/vomiting: May cause nausea, and/or vomiting, which may be dose-related; usually resolves in 1-3 weeks.
- Vagotonic effects: Cholinesterase inhibitors may have vagotonic effects which may cause bradycardia and/or heart block with or without a history of cardiac disease; syncopal episodes have been associated with donepezil.

Disease-related concerns:

- Cardiac conduction abnormalities: Use with caution in patients with sick-sinus syndrome, bradycardia, or conduction abnormalities. Alzheimer's treatment guidelines consider bradycardia to be a relative contraindication for use of centrally-active cholinesterase inhibitors.
- Peptic ulcer disease: Use with caution in patients at risk of ulcer disease (eg, previous history or NSAID use); may increase gastric acid secretion. Monitor for symptoms of bleeding.
- Respiratory disease: Use with caution in patients with COPD and/or asthma.
- Seizure disorder: Use with caution in patients with a history of seizure disorder.
- Urinary tract obstruction: Use with caution in patients with bladder outlet obstruction or prostatic hyperplasia; cholinomimetics may cause or worsen outflow obstructions, including possible exacerbation of BPH symptoms.

Concurrent drug therapy issues:

- Depolarizing neuromuscular-blocking agents: May exaggerate neuromuscular blockade effects of depolarizing neuromuscular-blocking agents like succinylcholine.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy Risk FactorC
Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women.
LactationExcretion in breast milk unknown/not recommended
Adverse Reactions

>10%:

Central nervous system: Insomnia (5% to 14%)

Gastrointestinal: Nausea (5% to 19%), diarrhea (8% to 15%)

Miscellaneous: Accident (7% to 13%), infection (11%)

1% to 10%:

Cardiovascular: Hypertension (3%), chest pain (2%), hemorrhage (2%), syncope (2%), hypotension, atrial fibrillation, bradycardia, ECG abnormal, edema, heart failure, hot flashes, peripheral edema, vasodilation

Central nervous system: Headache (4% to 10%), pain (3% to 9%), fatigue (3% to 8%), dizziness (2% to 8%), abnormal dreams (3%), depression (2% to 3%), hostility (3%), nervousness (3%), hallucinations (3%), confusion (2%), emotional lability (2%), personality disorder (2%), fever (2%), somnolence (2%), abnormal crying, aggression, agitation, anxiety, aphasia, delusions, irritability, restlessness, seizure

Dermatologic: Bruising (4% to 5%), eczema (3%), pruritus, rash, skin ulcer, urticaria

Endocrine & metabolic: Dehydration (2%), hyperlipemia (2%), libido increased

Gastrointestinal: Anorexia (3% to 8%), vomiting (3% to 8%), weight loss (3%), abdominal pain, constipation, dyspepsia, fecal incontinence, gastroenteritis, GI bleeding, bloating, epigastric pain, toothache

Genitourinary: Urinary frequency (2%), urinary incontinence (2%), hematuria, glycosuria, nocturia, UTI

Hematologic: Anemia

Hepatic: Alkaline phosphatase increased

Neuromuscular & skeletal: Muscle cramps (3% to 8%), back pain (3%), CPK increased (3%), arthritis (2%), ataxia, bone fracture, gait abnormal, lactate dehydrogenase increased, paresthesia, tremor, weakness

Ocular: Blurred vision, cataract, eye irritation

Respiratory: Cough increased, dyspnea, bronchitis, pharyngitis, pneumonia, sore throat

Miscellaneous: Diaphoresis, fungal infection, flu symptoms, wandering

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Abscess, breast fibroadenosis, cellulitis, cerebrovascular accident, CHF, cholecystitis, conjunctival hemorrhage, conjunctivitis, deep vein thrombosis, diabetes mellitus, diverticulitis, ear pain, eosinophilia, fibrocystic breast, gastrointestinal ulcer, glaucoma, goiter, heart block, hemolytic anemia, hepatitis, hostility, hyperglycemia, hypertonia, hypokalemia, hypokinesia, hyponatremia, hypoxia, intracranial hemorrhage, jaundice, LFTs increased, MI, neuroleptic malignant syndrome, pancreatitis, pleurisy, pulmonary collapse, pulmonary congestion, pyelonephritis, renal failure, retinal hemorrhage, SVT, thrombocythemia, thrombocytopenia, tongue edema, transient ischemic attack, vision abnormal

Metabolism/Transport Effects**Substrate** (minor) of CYP2D6, 3A4

Drug Interactions

Anticholinergics: May diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antipsychotics: Acetylcholinesterase Inhibitors (Central) may enhance the neurotoxic (central) effect of Antipsychotics. Severe extrapyramidal symptoms have occurred in some patients. *Risk C: Monitor therapy*

Beta-Blockers: Acetylcholinesterase Inhibitors may enhance the bradycardic effect of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Cholinergic Agonists: Acetylcholinesterase Inhibitors may enhance the adverse/toxic effect of Cholinergic Agonists. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. Increased muscular weakness may occur. *Risk C: Monitor therapy*

Ginkgo Biloba: May enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. *Risk C: Monitor therapy*

Neuromuscular-Blocking Agents (Nondepolarizing): Acetylcholinesterase Inhibitors may diminish the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). Acetylcholinesterase Inhibitors may decrease the metabolism of Neuromuscular-Blocking Agents (Nondepolarizing). This is only true for mivacurium in which case the neuromuscular blocking effects might be prolonged. *Risk C: Monitor therapy*

Succinylcholine: Acetylcholinesterase Inhibitors may enhance the neuromuscular-blocking effect of Succinylcholine. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: St John's wort may decrease donepezil levels. Gingko biloba may increase adverse effects/toxicity of acetylcholinesterase inhibitors.

Monitoring ParametersBehavior, mood, bowel function, cognitive function, general function (eg, activities of daily living)

Nursing: Physical Assessment/MonitoringAssess bladder adequacy prior to administering medication. Assess other medications patient may be taking for effectiveness and interactions. Assess results of laboratory tests, therapeutic effect, and adverse reactions (eg, cholinergic crisis). Monitor pulse. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationThis medication will not cure the disease, but may help reduce symptoms. Use as directed; do not increase dose or discontinue without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause dizziness, sedation, or hypotension (rise slowly from sitting or lying position and use caution when driving or climbing stairs); vomiting or loss of appetite (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); or diarrhea (boiled milk, yogurt, or buttermilk may help). Report persistent abdominal discomfort; significantly increased salivation, sweating, tearing, or urination; flushed skin; chest pain or palpitations; acute headache; unresolved diarrhea; excessive fatigue, insomnia, dizziness, or depression; increased muscle, joint, or body pain; vision changes or blurred vision; or shortness of breath or wheezing. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as hydrochloride:

Aricept®: 5 mg, 10 mg

Tablet, orally disintegrating, as hydrochloride:

Aricept® ODT: 5 mg, 10 mg

Generic AvailableNo

ManufacturerPfizer U.S. Pharmaceuticals Group

Pricing: U.S. (www.drugstore.com)

Tablet, orally-disintegrating (Aricept ODT)

5 mg (30): $188.62

Tablets (Aricept)

5 mg (30): $169.99

10 mg (30): $169.99

Mechanism of ActionAlzheimer's disease is characterized by cholinergic deficiency in the cortex and basal forebrain, which contributes to cognitive deficits. Donepezil reversibly and noncompetitively inhibits centrally-active acetylcholinesterase, the enzyme responsible for hydrolysis of acetylcholine. This appears to result in increased concentrations of acetylcholine available for synaptic transmission in the central nervous system.

Pharmacodynamics/Kinetics

Absorption: Well absorbed

Protein binding: 96%, primarily to albumin (75%) and α_1-acid glycoprotein (21%)

Metabolism: Extensively to four major metabolites (two are active) via CYP2D6 and 3A4; undergoes glucuronidation

Bioavailability: 100%

Half-life elimination: 70 hours; time to steady-state: 15 days

Time to peak, plasma: 3-4 hours

Excretion: Urine 57% (17% as unchanged drug); feces 15%

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Child/Adolescent ConsiderationsFive children (8-17 years of age) with ADHD showed improvement when treated with donepezil (Wilens, 2000). Four of 8 patients with autism (mean age: 11 years of age; range: 7-19 years) showed significant improvement in behaviors in a retrospective pilot study (Hardan, 2002). A retrospective chart review case series of 8 individuals (10-17 years of age) with pervasive developmental disorder showed improvement in ADHD-like symptoms upon treatment with donepezil (Doyle, 2006). Mean treatment duration was 18 weeks and dosing ranged from 2.5-30 mg/day. However, a 12-week, open-label, adjunctive trial of donepezil (dose range: 2.5-10 mg/day) in 7 children and 6 adults with stimulant-stabilized ADHD showed no significant improvement in ADHD rating scale or Executive Function Checklist (Wilens, 2005).

An 18-week, prospective, open-label, dose-escalation study of donepezil (2.5 mg, 5 mg, 10 mg daily) in 20 patients 8-14 years of age with tics (including Tourette’s syndrome) and comorbid ADHD showed significant improvement of tics at the 10 mg dose (Cubo, 2008). No improvement of ADHD was evident and a large number (65%) experienced adverse events, including a 50% study dropout rate.

Cubo E, Fern Ndez Jaén A, Moreno C, et al, “Donepezil Use in Children and Adolescents With Tics and Attention-Deficit/Hyperactivity Disorder: An 18-Week, Single-Center, Dose-Escalating, Prospective, Open-Label Study,” *Clin Ther*, 2008, 30(1):182-9.

Mental Health CommentBe mindful of other medications (and their intrinsic anticholinergic activity) that an individual is receiving. The effects of donepezil may be completely mitigated. If tolerated, increase dosage from 5 mg/day to 10 mg/day after 4-6 weeks.

DOPamine

Lexi-Drugs Online

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

DOPamine may be confused with DOBUTamine, Dopram®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(DOE pa meen)

Pharmacologic CategoryAdrenergic Agonist Agent

Use: Labeled IndicationsAdjunct in the treatment of shock (eg, MI, open heart surgery, renal failure, cardiac decompensation) which persists after adequate fluid volume replacement

Use: Unlabeled/InvestigationalSymptomatic bradycardia or heart block unresponsive to atropine or pacing

Dosing: Adults

Hemodynamic support: I.V. infusion: 1-5 mcg/kg/minute up to 50 mcg/kg/minute, titrate to desired response; infusion may be increased by 1-4 mcg/kg/minute at 10- to 30-minute intervals until optimal response is obtained

Note: If dosages >20-30 mcg/kg/minute are needed, a more direct-acting vasopressor may be more beneficial (ie, epinephrine, norepinephrine).

Hemodynamic effects of dopamine are dose dependent:

Low-dose: 1-5 mcg/kg/minute, increased renal blood flow and urine output

Intermediate-dose: 5-15 mcg/kg/minute, increased renal blood flow, heart rate, cardiac contractility, and cardiac output

High-dose: >15 mcg/kg/minute, alpha-adrenergic effects begin to predominate, vasoconstriction, increased blood pressure

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricHemodynamic support: I.V. infusion:

Children: 1-20 mcg/kg/minute, maximum: 50 mcg/kg/minute continuous infusion, titrate to desired response.

Calculations

- Dopamine

Administration: I.V.Vesicant. **Must be diluted prior to use**. Do not discontinue suddenly - sudden discontinuation may lead to marked hypotension.

Administration: I.V. DetailMonitor continuously for free flow. Administration into an umbilical arterial catheter is not recommended; central line administration.

Extravasation management: Due to short half-life, withdrawal of drug is often only necessary treatment. Use phentolamine as antidote. Mix 5 mg with 9 mL of NS; inject a small amount of this dilution into extravasated area. Blanching should reverse immediately. Monitor site. If blanching should recur, additional injections of phentolamine may be needed.

pH: 3.3-3.6

StorageProtect from light. Solutions that are darker than slightly yellow should not be used.

CompatibilityStable in D_5LR, $D_5{}^1/_2NS$, D_5NS, D_5W, $D_{10}W$, LR, mannitol 20%, NS; **incompatible** with sodium bicarbonate 5%, and alkaline solutions or iron salts.

Y-site administration: Compatible: Alatrofloxacin, aldesleukin, amifostine, amiodarone, atracurium, aztreonam, cefpirome, ciprofloxacin, cisatracurium, cladribine, clarithromycin, diltiazem, dobutamine, dobutamine with lidocaine, dobutamine with nitroglycerin, dobutamine with sodium nitroprusside, docetaxel, doxorubicin liposome, enalaprilat, epinephrine, esmolol, etoposide, famotidine, fentanyl, fluconazole, foscarnet, gatifloxacin, gemcitabine, granisetron, haloperidol, heparin, hydrocortisone sodium succinate, hydromorphone, inamrinone, labetalol, levofloxacin, lidocaine, lidocaine with nitroglycerin, lidocaine with sodium nitroprusside, linezolid, lorazepam, meperidine, methylprednisolone sodium succinate, metronidazole, midazolam, milrinone, morphine, nicardipine, nitroglycerin, nitroglycerin with sodium nitroprusside, norepinephrine, ondansetron, pancuronium, piperacillin/tazobactam, potassium chloride, propofol, ranitidine, remifentanil, sargramostim, sodium nitroprusside, streptokinase, tacrolimus, theophylline, thiotepa, tirofiban, tolazoline, vecuronium, verapamil, vitamin B complex with C, warfarin, zidovudine. **Incompatible:** Acyclovir, alteplase, amphotericin B cholesteryl sulfate complex, cefepime, indomethacin, insulin (regular), thiopental. **Variable (consult detailed reference):** Furosemide, TPN.

Compatibility in syringe: Compatible: Doxapram, heparin, ranitidine.

Compatibility when admixed: Compatible: Aminophylline, atracurium, bretylium, calcium chloride, chloramphenicol, dobutamine, enalaprilat, flumazenil, heparin, hydrocortisone sodium succinate, kanamycin, lidocaine, meropenem, methylprednisolone sodium succinate, nitroglycerin, oxacillin, potassium chloride, propafenone, ranitidine, verapamil. **Incompatible:** Acyclovir, alteplase, amphotericin B, ampicillin, metronidazole with sodium bicarbonate, penicillin G potassium. **Variable (consult detailed reference):** Gentamicin.

Contraindications Hypersensitivity to sulfites (commercial preparation contains sodium bisulfite); pheochromocytoma; ventricular fibrillation

Warnings/Precautions

Boxed warnings:

- Extravasation: See “Other warnings/precautions” below.

Concerns related to adverse effects:

- Arrhythmias: May cause increases in arrhythmias.
- Tachycardia: May cause increases in heart rate.
- Tissue necrosis: Avoid infiltration - may cause severe tissue necrosis.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease, cardiac arrhythmias and/or occlusive vascular disease.
- Myocardial infarct (post): Use with caution in patients post-MI.

Concurrent drug therapy issues:

- Monoamine oxidase inhibitors (MAO-I): Use with extreme caution in patients taking MAO inhibitors; prolong hypertension may result from concurrent use.

Dosage form specific issues:

- Sodium metabisulfite: Product may contain sodium metabisulfite.

Other warnings/precautions:

- Appropriate use: Assure adequate circulatory volume to minimize need for vasoconstrictors. Avoid hypertension; monitor blood pressure closely and adjust infusion rate.
- Extravasation: Avoid extravasation; infuse into a large vein if possible. Avoid infusion into leg veins. Watch I.V. site closely. **[U.S. Boxed Warning]: If extravasation occurs, infiltrate the area with diluted phentolamine (5-10 mg in 10-15 mL of saline) with a fine hypodermic needle. Phentolamine should be administered as soon as possible after extravasation is noted.**

Geriatric Considerations Has not been specifically studied in the elderly; monitor closely, especially due to increase in cardiovascular disease with age.

Pregnancy Risk Factor C

Lactation Excretion in breast milk unknown

Adverse Reactions Frequency not defined.

Most frequent:

Cardiovascular: Ectopic beats, tachycardia, anginal pain, palpitation, hypotension, vasoconstriction

Central nervous system: Headache

Gastrointestinal: Nausea and vomiting

Respiratory: Dyspnea

Infrequent:

Cardiovascular: Aberrant conduction, bradycardia, widened QRS complex, ventricular arrhythmia (high dose), gangrene (high dose), hypertension

Central nervous system: Anxiety

Endocrine & metabolic: Piloerection, serum glucose increased (usually not above normal limits)

Local: Extravasation of dopamine can cause tissue necrosis and sloughing of surrounding tissues

Ocular: Intraocular pressure increased, dilated pupils

Renal: Azotemia, polyuria

Drug Interactions

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

COMT Inhibitors: May decrease the metabolism of COMT Substrates. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Monitoring ParametersBlood pressure, ECG, heart rate, CVP, RAP, MAP, urine output; if pulmonary artery catheter is in place, monitor CI, PCWP, SVR, and PVR

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Infusion pump, continuous cardiac and hemodynamic monitoring, and frequent assessment of I.V. site is required for inpatient therapy. Low-dose home infusion therapy requires frequent monitoring of cardiac and renal status and adverse reactions. Monitor therapeutic effectiveness and adverse reactions. Instruct patient on adverse symptoms to report.

Monitoring: Lab TestsSerum glucose, renal function

Patient EducationWhen administered in emergencies, patient education should be appropriate to the situation. If patient is aware, instruct to promptly report chest pain, palpitations, rapid heartbeat, headache, nervousness or restlessness, nausea or vomiting, or respiratory difficulty.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Infusion, as hydrochloride [premixed in D_5W]: 0.8 mg/mL (250 mL, 500 mL); 1.6 mg/mL (250 mL, 500 mL); 3.2 mg/mL (250 mL)

Injection, solution, as hydrochloride: 40 mg/mL (5 mL, 10 mL); 80 mg/mL (5 mL); 160 mg/mL (5 mL) [contains sodium metabisulfite]

Generic AvailableYes

Mechanism of ActionStimulates both adrenergic and dopaminergic receptors, lower doses are mainly dopaminergic stimulating and produce renal and mesenteric vasodilation, higher doses also are both dopaminergic and beta$_1$-adrenergic stimulating and produce cardiac stimulation and renal vasodilation; large doses stimulate alpha-adrenergic receptors

Pharmacodynamics/Kinetics

Children: Dopamine has exhibited nonlinear kinetics in children; with medication changes, may not achieve steady-state for ~1 hour rather than 20 minutes

Onset of action: Adults: 5 minutes

Duration: Adults: <10 minutes

Metabolism: Renal, hepatic, plasma; 75% to inactive metabolites by monoamine oxidase and 25% to norepinephrine

Half-life elimination: 2 minutes

Excretion: Urine (as metabolites)

Clearance: Neonates: Varies and appears to be age related; clearance is more prolonged with combined hepatic and renal dysfunction

Related Information

- Hemodynamic Support, Intravenous

Pharmacotherapy PearlsDopamine is most frequently used for treatment of hypotension because of its peripheral vasoconstrictor action. In this regard, dopamine is often used together with dobutamine and minimizes hypotension secondary to dobutamine-induced vasodilation. Thus, pressure is maintained by increased cardiac output (from dobutamine) and vasoconstriction (by dopamine). It is critical neither dopamine nor dobutamine be used in patients in the absence of correcting any hypovolemia as a cause of hypotension.

Low-dose dopamine is often used in the intensive care setting for presumed beneficial effects on renal function. However, there is no clear evidence that low-dose dopamine confers any renal or other benefit. Indeed, dopamine may act on dopamine receptors in the carotid bodies causing chemoreflex suppression. In patients with heart failure, dopamine may inhibit breathing and cause pulmonary shunting. Both these mechanisms would act to decrease minute ventilation and oxygen saturation. This could potentially be deleterious in patients with respiratory compromise and patients being weaned from ventilators.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentDopamine's effects may be enhanced by MAO inhibitors

Cardiovascular ConsiderationsDopamine is most frequently used for treatment of hypotension because of its peripheral vasoconstrictor action. In this regard, dopamine is often used together with dobutamine and minimizes hypotension secondary to dobutamine-induced vasodilation. Thus, pressure is maintained by increased cardiac output (from dobutamine) and vasoconstriction (by dopamine). It is critical neither dopamine nor dobutamine be used in patients in the absence of correcting any hypovolemia as a cause of hypotension.

Low-dose dopamine is often used in the intensive care setting for presumed beneficial effects on renal function. However, there is no clear evidence that low-dose dopamine confers any renal or other benefit. Indeed, dopamine may act on dopamine receptors in the carotid bodies causing chemoreflex suppression. In patients with heart failure, dopamine may inhibit breathing and cause pulmonary shunting. Both these mechanisms would act to decrease minute ventilation and oxygen saturation. This could potentially be deleterious in patients with respiratory compromise and patients being weaned from ventilators.

Anesthesia and Critical Care Concerns/Other Considerations

Low-Dose Dopamine: There is no clear evidence that low-dose dopamine confers any renal benefit. The 2004 ACCM/SCCM Practice Parameters for Hemodynamic Support of Sepsis in Adult Patients recommends against the use of low doses of dopamine to maintain renal function. Low-dose dopamine may increase renal blood flow in some patients requiring norepinephrine. Kellum and Decker (2001) reviewed 58 studies in a meta-analysis focused on determining if low-dose dopamine reduced the severity of acute renal failure, the need for dialysis, or mortality in critically-ill patients. They concluded that the use of low-dose dopamine for the treatment or prevention of acute renal failure cannot be justified. A more recent randomized, double-blind, placebo-controlled trial came to a similar conclusion (Australian and New Zealand Intensive Care Society Clinical Trials Group, 2000). This study enrolled over 300 ICU patients with clinical evidence of renal dysfunction. They were randomized to low-dose dopamine (2 mcg/kg/minute) or placebo. The investigators found no difference in serum creatinine, renal replacement therapy, intensive care length of stay, hospital stay, or mortality between the groups. The 2008 Surviving Sepsis Campaign guidelines also recommend against the use of low-dose dopamine for renal protection (Grade 1A).

Septic Shock: In septic shock, dopamine is effective in increasing mean arterial pressure in patients who remain hypotensive after adequate volume expansion. Undesirable effects include tachycardia, increased pulmonary shunt, and decreased P_aO_2. As catecholamine stores are depleted, tachyphylaxis may occur. The 2004 ACCM/SCCM Practice Parameters for Hemodynamic Support of Sepsis in Adult Patients recommend either norepinephrine or dopamine as vasopressor therapy. Norepinephrine has a wider dosage range than dopamine.

The 2008 Surviving Sepsis Campaign guidelines recommend using either norepinephrine or dopamine as the first-choice vasopressor agent in adult patients (Grade 1C). Norepinephrine is more potent than dopamine and may be more effective at reversing hypotension in septic shock. In pediatric patients with hypotension refractory to fluid resuscitation, the Surviving Sepsis Campaign guidelines suggest dopamine as the first choice of support (Grade 2C).

Index TermsDopamine Hydrochloride; Intropin

Doripenem

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(dore i PEN em)

U.S. Brand NamesDoribax™

Pharmacologic Category[Antibiotic, Carbapenem]

Use: Labeled IndicationsTreatment of complicated intra-abdominal infections and complicated urinary tract infections (including pyelonephritis) due to susceptible gram-positive, gram-negative (including *Pseudomonas aeruginosa*), and anaerobic bacteria

Use: Unlabeled/InvestigationalTreatment of nosocomial pneumonia

Dosing: Adults

Intra-abdominal infection (complicated): I.V.: 500 mg every 8 hours for 5-14 days

Urinary tract infection (complicated) or pyelonephritis: I.V.: 500 mg every 8 hours for 10-14 days

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} 30-50 mL/minute: 250 mg every 8 hours

Cl_{cr} 11-29 mL/minute: 250 mg every 12 hours

Hemodialysis: Dialyzable (~52% of dose removed during 4-hour session in ESRD patients)

Calculations

- Creatinine Clearance: Adults

Administration: I.V.Infuse over 1 hour

StorageStore dry powder vials at 15°C to 30°C (59°F to 86°F). Stability of solution (concentration: 4.5 mg/mL) when diluted in NS is 8 hours at room temperature or 24 hours under refrigeration; stability in D_5W is 4 hours at room temperature and 24 hours under refrigeration.

ReconstitutionReconstitute 500 mg vial with 10 mL of SWFI or NS. Shake gently until clear. Further dilute for infusion with 100 mL of NS or D_5W. Reconstituted vial may be stored for up to 1 hour prior to preparation of infusion solution.

Renal impairment: For preparation of a 250 mg dose in renal impairment, reconstitute 500 mg vial with 10 mL of SWFI or NS and further dilute with 100 mL of compatible solution as above, but remove and discard 55 mL from the infusion bag to leave the remaining solution containing the 250 mg dose (concentration: 4.5 mg/mL).

ContraindicationsKnown serious hypersensitivity to doripenem or other carbapenems (eg, imipenem, ertapenem, meropenem); anaphylactic reactions to beta-lactam antibiotics

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis/hypersensitivity reactions: Serious hypersensitivity reactions, including anaphylaxis, and skin reactions have been reported in patients receiving beta-lactams.
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment required in patients with moderate-to-severe renal dysfunction.

Concurrent drug therapy issues:

- Valproic acid: Levels of valproic acid may be decreased to subtherapeutic levels during concomitant use, increasing potential for breakthrough seizures.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <18 years of age.

Other warnings/precautions:

- Appropriate use: Administer via intravenous infusion only. Per manufacturer's labeling, investigational experience of doripenem via inhalation resulted in pneumonitis.

Geriatric ConsiderationsCareful attention to dose adjustment based on renal function, as well as monitoring renal function during treatment is recommended. According to the manufacturer, 28% of clinical trial patients were ≥65 years and 12% were ≥75 years, with no differences in overall age-related safety findings.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAdverse events have not been observed in animal studies; therefore, the manufacturer classifies doripenem as pregnancy category B. There are no adequate and well-controlled studies completed in pregnant women.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsIt is not known if doripenem is excreted into breast milk. The manufacturer recommends that caution be exercised when administering doripenem to nursing women.

Pregnancy & Lactation, In-Depth

- Doripenem in Pregnancy & Lactation

Adverse Reactions

>10%:

Central nervous system: Headache (4% to 16%)

Gastrointestinal: Nausea (4% to 12%), diarrhea (6% to 11%)

1% to 10%:

Dermatologic: Rash (1% to 5%; includes allergic/bullous dermatitis, erythema, macular/papular eruptions, urticaria, and erythema multiforme), pruritus (≤3%)

Gastrointestinal: Oral candidiasis (1%)

Hematologic: Anemia (2% to 10%)

Hepatic: Transaminases increased (1% to 2%)

Local: Phlebitis (4% to 8%)

Renal: Renal impairment/failure (≤1%)

Miscellaneous: Vulvomycotic infection (1% to 2%)

Postmarketing and/or case reports: Anaphylaxis, interstitial pneumonia, Stevens-Johnson syndrome, seizure, toxic epidermal necrolysis

Drug Interactions

Probenecid: May increase the serum concentration of Doripenem. This effect is due to probenecid's ability to decrease the active tubular secretion of doripenem. *Risk D: Consider therapy modification*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Carbapenems. Management: Avoid concomitant use of doripenem and probenecid. *Risk C: Monitor therapy*

Valproic Acid: Carbapenems may decrease the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Monitoring ParametersMonitor for signs of anaphylaxis during first dose; periodic renal assessment; consider hematologic monitoring during prolonged therapy

Nursing: Physical Assessment/MonitoringAssess results of culture and sensitivity tests and patient history of previous allergies or adverse drug reactions. Use caution in presence of renal impairment. Assess all other pharmacological or herbal products patient may be taking for potential adverse interactions. Patient must be monitored closely for adverse reactions, especially anaphylaxis or skin reactions. Teach patient interventions to reduce side effects and adverse symptoms to report.

Monitoring: Lab TestsPeriodic renal assessment; consider hematologic monitoring during prolonged therapy

Patient EducationThis medication can only be administered intravenously. Report warmth, swelling, or irritation at infusion site; difficulty breathing; facial swelling; or acute anxiety. Maintain adequate nutrition and hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Report prolonged GI effects (diarrhea, nausea); unusual skin rash; excessive or persistent fatigue or weakness; or other persistent adverse effects. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Doribax™: 500 mg

Generic AvailableNo

ManufacturerJohnson and Johnson

Mechanism of ActionInhibits bacterial cell wall synthesis by binding to several of the penicillin-binding proteins, which in turn inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell walls, thus inhibiting cell wall biosynthesis; bacteria eventually lyse due to ongoing activity of cell wall autolytic enzymes (autolysins and murein hydrolases) while cell wall assembly is arrested.

Pharmacodynamics/Kinetics

Distribution: V_d: 16.8 L

Protein binding: 8% to 9%

Metabolism: Non-CYP-mediated metabolism via dehydropeptidase-I to doripenem-M1 (inactive metabolite)

Half-life elimination: ~1 hour

Excretion: Urine (70% as unchanged drug; 15% as doripenem-M1 metabolite); feces (<1%)

Dental Health: Effects on Dental TreatmentProlonged use of doripenem may lead to development of oral candidiasis.
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentGI side effects are common; concomitant use with SSRIs, carbamazepine, valproic acid, and lithium may produce additive effects. Doripenem may decrease valproic acid levels resulting in breakthrough seizures.
Index TermsS-4661

English English

Jump To Field (Select Field Name)

Pronunciation(DOOR nase AL fa)
U.S. Brand NamesPulmozyme®
Canadian Brand NamesPulmozyme®
Pharmacologic CategoryEnzyme
Use: Labeled IndicationsManagement of cystic fibrosis patients to reduce the frequency of respiratory infections that require parenteral antibiotics in patients with FVC ≥40% of predicted; in conjunction with standard therapies, to improve pulmonary function in patients with cystic fibrosis
Dosing: AdultsMucolytic: Inhalation: 2.5 mg once daily through selected nebulizers
Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Mucolytic (cystic fibrosis): Inhalation:

Children ≥3 months: 2.5 mg once daily through selected nebulizers; experience in children <5 years is limited

Note: Patients unable to inhale or exhale orally throughout the entire treatment period may use Pari-Baby™ nebulizer. Some patients may benefit from twice daily administration.

StorageMust be stored in the refrigerator at 2°C to 8°C (36°F to 46°F) and protected from strong light.
CompatibilityShould not be diluted or mixed with any other drugs in the nebulizer; this may inactivate the dornase alfa.
ContraindicationsHypersensitivity to dornase alfa, Chinese hamster ovary cell products, or any component of the formulation
Warnings/Precautions

Disease-related concerns:

- Decreased pulmonary function: In patients with pulmonary function <40% of normal, dornase alfa does not significantly reduce the risk of respiratory infections that require parenteral antibiotics.

Special populations:

- Pediatrics: Safety studies included children ≥3 months, however experience is limited in children <5 years of age.

Other warnings/precautions:

- Prolonged therapy: Safety and efficacy have not been established for daily administration >12 months.

Pregnancy Risk FactorB
Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women.
LactationExcretion in breast milk unknown/use caution
Breast-Feeding ConsiderationsMeasurable amounts would not be expected in breast milk following inhalation; however, it is not known if dornase alfa is excreted in human milk.
Adverse ReactionsAdverse events were similar in children using the PARI BABY™ nebulizer (facemask as opposed to mouthpiece) with the addition of cough (45% in children 3 months to <5 years; 30% in children 5 to ≤10 years).

>10%:

Cardiovascular: Chest pain (18% to 25%)

Central nervous system: Fever (32% in patients with FVC <40%)

Dermatologic: Rash (3% to 12%)

Respiratory: Pharyngitis (32% to 40%), rhinitis (30% in patients with FVC <40%); FVC decrease ≥10% of predicted (22% in patients with FVC <40%), dyspnea (17% in patients with FVC <40%)

Miscellaneous: Voice alteration (12% to 18%)

1% to 10%:

Gastrointestinal: Dyspepsia (≤3%)

Ocular: Conjunctivitis (1% to 5%)

Respiratory: Laryngitis (3% to 4%)

Miscellaneous: Dornase alfa serum antibodies (2% to 4%)

Postmarketing and/or case reports: Headache, urticaria

Drug InteractionsThere are no known significant interactions.

Nursing: Physical Assessment/MonitoringAssess effectiveness of therapy and adverse reactions at beginning of therapy and periodically with long-term use. Teach patient or caregiver appropriate use of nebulizer, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationInform prescriber of any allergies you have. Use exactly as directed by prescriber (see following administration information). Report any signs of adverse response, skin rash, sore throat, respiratory difficulty, wheezing, or cough. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Self-administered nebulizer: Store in refrigerator, away from light. Do not combine with any other medications in the nebulizer. Wash hands before and after treatment. Wash and dry nebulizer after each treatment. Twist open the top of one unit dose vial and squeeze contents into nebulizer reservoir. Connect nebulizer reservoir to the mouthpiece or face mask. Connect nebulizer to compressor. Sit in comfortable, upright position. Put on face mask and turn on compressor. Avoid leakage around the mask to avoid mist getting into eyes. Breathe calmly and deeply until no more mist is formed in nebulizer (about 5 minutes). At this point treatment is finished.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution for nebulization [preservative free]:

Pulmozyme®: 1 mg/mL (2.5 mL) [derived from Chinese hamster cells]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Solution (Pulmozyme)

1 mg/mL (75): $1785.65

Mechanism of ActionThe hallmark of cystic fibrosis lung disease is the presence of abundant, purulent airway secretions composed primarily of highly polymerized DNA. The principal source of this DNA is the nuclei of degenerating neutrophils, which is present in large concentrations in infected lung secretions. The presence of this DNA produces a viscous mucous that may contribute to the decreased mucociliary transport and persistent infections that are commonly seen in this population. Dornase alfa is a deoxyribonuclease (DNA) enzyme produced by recombinant gene technology. Dornase selectively cleaves DNA, thus reducing mucous viscosity and as a result, airflow in the lung is improved and the risk of bacterial infection may be decreased.

Pharmacodynamics/Kinetics

Onset of action: Nebulization: Enzyme levels are measured in sputum in ~15 minutes

Duration: Rapidly declines

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Pharyngitis

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Dorzolamide and Timolol

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(dor ZOLE a mide & TYE moe lole)
U.S. Brand NamesCosopt®
Canadian Brand NamesCosopt®; Preservative-Free Cosopt®
Pharmacologic CategoryBeta Blocker, Nonselective; Carbonic Anhydrase Inhibitor; Ophthalmic Agent, Antiglaucoma
Use: Labeled IndicationsTreatment of elevated intraocular pressure in patients with ocular hypertension or open-angle glaucoma
Dosing: Adults**Reduction of intraocular pressure:** Ophthalmic: Instill 1 drop in affected eye(s) twice daily
Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Reduction of intraocular pressure: Ophthalmic: Children ≥2 years: Refer to adult dosing.

Administration: OtherIf using additional topical ophthalmic preparations, separate administration by at least 10 minutes. Remove contact lens prior to administration and wait 15 minutes before reinserting. Instruct patients to avoid allowing the tip of the dispensing container to contact the eye or surrounding structures. Ocular solutions can become contaminated by common bacteria known to cause ocular infections. Serious damage to the eye and subsequent loss of vision may occur from using contaminated solutions.
StorageStore at 15°C to 30°C (59°F to 86°F). Protect from light.
ContraindicationsHypersensitivity to dorzolamide, timolol, or any component of the formulation; sinus bradycardia, heart block greater than first degree (except in patients with a functioning artificial pacemaker); cardiogenic shock; uncompensated cardiac failure; bronchospastic disease or asthma; history of bronchial asthma; severe COPD. Also see individual agents.
Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactic reactions: Use caution with history of severe anaphylaxis to allergens; patients taking beta-blockers may become more sensitive to repeated challenges. Treatment of anaphylaxis (eg, epinephrine) in patients taking beta-blockers may be ineffective or promote undesirable effects.

- Bacterial keratitis: Inadvertent contamination of multiple-dose ophthalmic solutions has caused bacterial keratitis.

- Ocular effects: Local ocular adverse effects (conjunctivitis and lid reactions) were reported with chronic administration; many resolved upon discontinuation of drug therapy. Choroidal detachment has been reported after filtration procedures. Patients with low endothelial cell counts may have increased risk for corneal edema; use caution.

- Sulfonamide allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is not specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe.

- Systemic effects: Systemic absorption and adverse effects (similar to sulfonamides) including blood dyscrasias, Stevens-Johnson syndrome, toxic epidermal necrolysis, and fulminant hepatic necrosis may occur with ophthalmic use. Bradycardia and/or hypotension may also occur due to beta-blockade.

Disease-related concerns:

- Angle-closure glaucoma: Appropriate use: Should not be used alone in angle-closure glaucoma (has no effect on pupillary constriction).

- Conduction abnormality: Consider pre-existing conditions such as sick sinus syndrome before initiating.

- Diabetes: Use with caution in patients with diabetes mellitus; may potentiate hypoglycemia and/or mask signs and symptoms.

- Heart failure (HF): Use with caution in patients with compensated heart failure and monitor for a worsening of the condition.

- Hepatic impairment: Use with caution in patients with hepatic impairment; not evaluated.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis; may worsen disease or other myasthenic symptoms (diplopia, ptosis).

- Peripheral vascular disease (PVD): Use with caution in patients with PVD (including Raynaud's).

- Psychiatric disease: Use with caution in patients with a history of psychiatric illness; may cause or exacerbate CNS depression.

- Renal impairment: Use with caution in patients with renal impairment; not recommended with severe impairment (Cl_{cr} <30 mL/minute).

- Respiratory disease: In general, patients with mild-to-moderate COPD or bronchospastic disease should not receive beta-blockers; if used at all, should be used cautiously with close monitoring.

- Thyroid disease: Signs of hyperthyroidism (eg, tachycardia) may be masked by beta-blockers. Avoid abrupt withdrawal if thyrotoxicosis is suspected (may precipitate thyroid storm).

Concurrent drug therapy issues:

- Anesthetic agents: Use with caution in patients receiving anesthetic agents which decrease myocardial function.
- Calcium channel blockers: Use with caution in patients on concurrent verapamil or diltiazem; bradycardia or heart block can occur.
- Oral carbonic anhydrase inhibitors: Concurrent use with oral carbonic anhydrase inhibitors is not recommended.

Special populations:

- Contact lens wearers: Some products may contain benzalkonium chloride which may be absorbed by soft contact lenses; remove lens prior to administration and wait 15 minutes before reinserting.
- Pediatrics: Safety and efficacy have not been established in children <2 years of age.

Other warnings/precautions:

- Abrupt withdrawal: Beta-blocker therapy should not be withdrawn abruptly (particularly in patients with CAD), but gradually tapered to avoid acute tachycardia, hypertension, and/or ischemia.

Also see individual agents.

Pregnancy Risk FactorC

Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women with the combination product. Use only if benefit outweighs risk. See individual agents.

LactationExcreted in breast milk (timolol)/not recommended

Breast-Feeding ConsiderationsTimolol is excreted in breast milk following oral and ophthalmic administration, and is considered compatible by the AAP. However, it is unknown whether dorzolamide is also excreted. Therefore, use of the combination product during lactation cannot be recommended at this time.

Adverse ReactionsPercentages as reported with combination product. Also see individual agents.

>5%:

Gastrointestinal: Taste perversion (≤30%)

Ocular: Burning/stinging (≤30%), blurred vision (5% to 15%), conjunctival hyperemia (5% to 15%), itching (5% to 15%), superficial punctuate keratitis (5% to 15%)

1% to 5%:

Cardiovascular: Hypertension

Central nervous system: Dizziness, headache

Gastrointestinal: Abdominal pain, dyspepsia, nausea

Genitourinary: Urinary tract infection

Neuromuscular & skeletal: Back pain

Ocular: Blepharitis, cloudy vision, conjunctival discharge, conjunctival edema, conjunctival follicles, conjunctivitis, corneal erosion, corneal staining, cortical lens opacity, dryness, eye debris, eye/eyelid discharge, eye/eyelid pain, eyelid edema, eyelid erythema, eyelid exudate/scales, foreign body sensation, glaucomatous cupping, lens nucleus discoloration, lens opacity, post-subcapsular cataract, tearing, visual field defect, vitreous detachment

Respiratory: Bronchitis, cough, pharyngitis, sinusitis, upper respiratory infection

Miscellaneous: Flu

<1%, postmarketing, and/or case reports: Bradycardia, cardiac failure, cerebral vascular accident, chest pain, choroidal detachment (following filtration procedures), depression, diarrhea, dyspnea, heart block, hypotension, iridocyclitis, MI, nasal congestion, paresthesia, photophobia, respiratory failure, skin rash, urolithiasis, vomiting, xerostomia

Metabolism/Transport Effects

Dorzolamide: **Substrate** (minor) of CYP2C8/9, 3A4

Timolol: **Substrate** of CYP2D6 (major); **Inhibits** CYP2D6 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): Beta-Blockers may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Epinephrine used as a local anesthetic for dental procedures will not likely cause clinically relevant problems. **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha1-Blockers: Beta-Blockers may enhance the orthostatic effect of Alpha1-Blockers. The risk associated with ophthalmic products is probably less than systemic products. *Risk D: Consider therapy modification*

Alpha2-Agonists: Beta-Blockers may enhance the rebound hypertensive effect of Alpha2-Agonists. This effect can occur when the alpha$_2$-agonist is abruptly withdrawn. **Exceptions:** Apraclonidine; Brimonidine. *Risk D: Consider therapy modification*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Aminoquinolines (Antimalarial): May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Amiodarone: May enhance the bradycardic effect of Beta-Blockers. Possibly to the point of cardiac arrest. Amiodarone may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Anilidopiperidine Opioids: May enhance the bradycardic effect of Beta-Blockers. Anilidopiperidine Opioids may enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Beta-Blockers. Beta-Blockers may decrease the metabolism of Antipsychotic Agents (Phenothiazines). Antipsychotic Agents (Phenothiazines) may decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Barbiturates: May decrease the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Beta2-Agonists: Beta-Blockers (Nonselective) may diminish the bronchodilatory effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Nondihydropyridine): May enhance the hypotensive effect of Beta-Blockers. Bradycardia and signs of heart failure have also been reported. Calcium Channel Blockers (Nondihydropyridine) may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Cardiac Glycosides: Beta-Blockers may enhance the bradycardic effect of Cardiac Glycosides. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Dipyridamole: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Disopyramide: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Insulin: Beta-Blockers may enhance the hypoglycemic effect of Insulin. *Risk C: Monitor therapy*

Lidocaine: Beta-Blockers may decrease the metabolism of Lidocaine. *Risk C: Monitor therapy*

Memantine: Carbonic Anhydrase Inhibitors may decrease the excretion of Memantine. *Risk C: Monitor therapy*

Methacholine: Beta-Blockers may enhance the adverse/toxic effect of Methacholine. *Risk X: Avoid combination*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Midodrine: Beta-Blockers may enhance the bradycardic effect of Midodrine. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Propafenone: May decrease the metabolism of Beta-Blockers. Propafenone possesses some independent beta blocking activity. *Risk C: Monitor therapy*

Propoxyphene: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

QuiNIDine: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Reserpine: May enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Beta-Blockers. **Exceptions:** Rifabutin. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Salicylates: May enhance the adverse/toxic effect of Carbonic Anhydrase Inhibitors. Salicylate toxicity might be enhanced by this same combination. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the bradycardic effect of Beta-Blockers. **Exceptions:** Fluvoxamine. *Risk C: Monitor therapy*

Theophylline Derivatives: Beta-Blockers (Nonselective) may diminish the bronchodilatory effect of Theophylline Derivatives. *Risk D: Consider therapy modification*

Monitoring ParametersOphthalmic exams and IOP periodically

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Solution, ophthalmic: Dorzolamide hydrochloride 2% (as base) and timolol maleate 0.5% (as base) (10 mL)

Cosopt®: Dorzolamide hydrochloride 2% (as base) and timolol maleate 0.5% (as base) (5 mL [DSC]; 10 mL) [contains benzalkonium chloride]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Solution (Cosopt)

2-0.5% (5): $58.99

2-0.5% (10): $123.89

Mechanism of Action

Dorzolamide: Inhibits carbonic anhydrase in the ciliary processes of the eye resulting decreased bicarbonate ion formation which decreases sodium and fluid transport, thus decreasing aqueous humor secretion and reduces intraocular pressure.

Timolol: Blocks both beta$_1$- and beta$_2$-adrenergic receptors, reduces intraocular pressure by reducing aqueous humor production or possibly outflow

Pharmacodynamics/KineticsSee individual agents.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Taste perversion.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness, dizziness, or fatigue; may rarely cause anxiety, depression, or hallucinations

Mental Health: Effects on Psychiatric TreatmentBarbiturates and carbamazepine may decrease the effects of beta-blockers

Index TermsTimolol and Dorzolamide

Dorzolamide

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(dor ZOLE a mide)
U.S. Brand NamesTrusopt®
Canadian Brand NamesTrusopt®
Pharmacologic CategoryCarbonic Anhydrase Inhibitor; Ophthalmic Agent, Antiglaucoma
Use: Labeled IndicationsTreatment of elevated intraocular pressure in patients with ocular hypertension or open-angle glaucoma
Dosing: AdultsReduction of intraocular pressure: Ophthalmic: Instill 1 drop in the affected eye(s) 3 times/day
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricRefer to adult dosing.
Administration: OtherIf more than one topical ophthalmic drug is being used, administer the drugs at least 10 minutes apart. Remove contact lens prior to administration and wait 15 minutes before reinserting. Instruct patients to avoid allowing the tip of the dispensing container to contact the eye or surrounding structures. Ocular solutions can become contaminated by common bacteria known to cause ocular infections. Serious damage to the eye and subsequent loss of vision may occur from using contaminated solutions.
StorageStore at room temperature 15°C to 30°C (59°F to 86°F). Protect from light.
ContraindicationsHypersensitivity to dorzolamide or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Bacterial keratitis: Inadvertent contamination of multiple-dose ophthalmic solutions, has caused bacterial keratitis.

- Ocular effects: Local ocular adverse effects (conjunctivitis and lid reactions) were reported with chronic administration; many resolved upon discontinuation of drug therapy. Choroidal detachment has been reported after filtration procedures. Patients with low endothelial cell counts may have increased risk for corneal edema; use caution.

- Sulfonamide allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is not specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe.

- Systemic effects: Systemic absorption and adverse effects (similar to sulfonamides) including, blood dyscrasias, Stevens-Johnson syndrome, toxic epidermal necrolysis, and fulminant hepatic necrosis may occur with ophthalmic use.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; not evaluated.

- Renal impairment: Use with caution in patients with renal impairment; not recommended with severe impairment (Cl_{cr} <30 mL/minute).

Concurrent drug therapy issues:

- Oral carbonic anhydrase inhibitors: Concurrent use with oral carbonic anhydrase inhibitors is not recommended.

Special populations:

- Contact lens wearers: Product contains benzalkonium chloride which may be absorbed by soft contact lenses; remove lens prior to administration and wait 15 minutes before reinserting.

Geriatric ConsiderationsThe oral carbonic anhydrase inhibitors are useful for patients who have difficulty administering ophthalmic drops, who do not achieve sufficient lowering of IOP, or who cannot tolerate other agents. Dorzolamide is an important addition that may be useful in the latter two groups, but with better tolerance than its oral counterpart.
Pregnancy Risk FactorC
LactationExcretion in breast milk unknown/not recommended
Adverse Reactions

>10%:

Gastrointestinal: Bitter taste following administration (25%)

Ocular: Burning, stinging or discomfort immediately following administration (33%); superficial punctate keratitis (10% to 15%); signs and symptoms of ocular allergic reaction (10%)

1% to 5%: Ocular: Blurred vision, conjunctivitis, dryness, lid reactions, photophobia, redness, tearing

<1%, postmarketing and/or case reports: Allergic reaction (systemic), angioedema, bronchospasm, choriodal detachment (following filtration procedures), contact dermatitis, dizziness, dyspnea, epistaxis, eyelid crusting, fatigue, headache, iridocyclitis (rare), myopia (transient), nausea, ocular pain, paresthesia, pharyngitis, pruritus, rash (rare), throat irritation, urolithiasis (rare), urticaria, weakness, xerostomia

Metabolism/Transport Effects**Substrate** (minor) of CYP2C9, 3A4

Drug Interactions

Memantine: Carbonic Anhydrase Inhibitors may decrease the excretion of Memantine. *Risk C: Monitor therapy*

Salicylates: May enhance the adverse/toxic effect of Carbonic Anhydrase Inhibitors. Salicylate toxicity might be enhanced by this same combination. *Risk D: Consider therapy modification*

Monitoring ParametersOphthalmic exams and IOP periodically

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess therapeutic response and adverse effects. Teach patient proper use, side effects/appropriate interventions, and symptoms to report.

Patient EducationFor use in eyes only. If serious or unusual reactions or signs of hypersensitivity occur, discontinue use of the product. If any ocular reactions, particularly conjunctivitis and lid reactions, discontinue use and notify prescriber. If an intercurrent ocular condition (eg, trauma, ocular surgery, infection) occur, immediately seek your prescriber's advice concerning the continued use of the present multidose container. Avoid allowing the tip of the dispensing container to contact the eye or surrounding structures. Take out contact lenses before using medicine. Lenses can be replaced 15 minutes after medicine is given. **Pregnancy precaution:** Inform prescriber if you are pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, ophthalmic: 2% (10 mL)

Trusopt®: 2% (10 mL) [contains benzalkonium chloride]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Solution (Trusopt)

2% (10): $74.12

Mechanism of ActionReversible inhibition of the enzyme carbonic anhydrase resulting in reduction of hydrogen ion secretion at renal tubule and an increased renal excretion of sodium, potassium, bicarbonate, and water to decrease production of aqueous humor; also inhibits carbonic anhydrase in central nervous system to retard abnormal and excessive discharge from CNS neurons

Pharmacodynamics/Kinetics

Onset of action: Peak effect: 2 hours

Duration: 8-12 hours

Absorption: Topical: Reaches systemic circulation where it accumulates in RBCs during chronic dosing as a result of binding to CA-II

Distribution: In RBCs during chronic administration

Protein binding: 33%

Metabolism: To N-desethyl metabolite (less potent than parent drug)

Half-life elimination: Terminal RBC: 147 days; washes out of RBCs nonlinearly, resulting in a rapid decline of drug concentration initially, followed by a slower elimination phase with a half-life of about 4 months

Excretion: Urine (as unchanged drug and metabolite, N-desethyl)

Related Information

- Glaucoma Drug Therapy

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness

Mental Health: Effects on Psychiatric TreatmentNone reported

Doxapram

Lexi-Drugs Online

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

> Doxapram may be confused with doxacurium, doxazosin, doxepin, Doxinate®, DOXOrubicin
>
> Dopram® may be confused with DOPamine

Pronunciation(DOKS a pram)
U.S. Brand NamesDopram®
Pharmacologic CategoryRespiratory Stimulant; Stimulant
Use: Labeled IndicationsRespiratory and CNS stimulant for respiratory depression secondary to anesthesia, drug-induced CNS depression; acute hypercapnia secondary to COPD
Dosing: Adults

Respiratory depression following anesthesia:

Intermittent injection: Initial: 0.5-1 mg/kg; may repeat at 5-minute intervals (only in patients who demonstrate initial response); maximum total dose: 2 mg/kg

I.V. infusion: Initial: 5 mg/minute until adequate response or adverse effects seen; decrease to 1-3 mg/minute; maximum total dose: 4 mg/kg

Drug-induced CNS depression:

Intermittent injection: Initial: Priming dose of 1-2 mg/kg; repeat after 5 minutes; may repeat at 1-2 hour intervals (until sustained consciousness); maximum 3 g/day. May repeat in 24 hours if necessary.

I.V. infusion: Initial: Priming dose of 1-2 mg/kg repeated in 5 minutes. If no response, wait 1-2 hours and repeat. If some stimulation is noted, initiate infusion at 1-3 mg/minute (depending on size of patient/depth of CNS depression); suspend infusion if patient begins to awaken. Infusion should not be continued for >2 hours. May reinstitute infusion as described above, including bolus, after rest interval of 30 minutes to 2 hours; maximum: 3 g/day

Acute hypercapnia secondary to COPD: I.V. infusion: Initial: Initiate infusion at 1-2 mg/minute (depending on size of patient/depth of CNS depression); may increase to maximum rate of 3 mg/minute; infusion should not be continued for >2 hours. Monitor arterial blood gases prior to initiation of infusion and at 30-minute intervals during the infusion (to identify possible development of acidosis/CO_2 retention). Additional infusions are not recommended (per manufacturer).

Dosing: ElderlyRefer to adult dosing.
Administration: I.V.Avoid rapid infusion.
StorageStore at 20°C to 25°C (68°F to 77°F).
Reconstitution

Drug-induced CNS depression or postanesthesia: Mix doxapram 250 mg in 250 mL of D_5W, $D_{10}W$, or NS.

COPD-associated hypercapnia: Mix doxapram 400 mg in 180 mL of D_5W, $D_{10}W$, or NS (final concentration: 2 mg/mL).

CompatibilityStable in D_5W, $D_{10}W$, NS.

Compatibility in syringe: Compatible: Amikacin, bumetanide, chlorpromazine, cimetidine, cisplatin, cyclophosphamide, dopamine, doxycycline, epinephrine, hydroxyzine, isoniazid, lincomycin, methotrexate, phytonadione, pyridoxine, terbutaline, thiamine, tobramycin, vincristine. **Incompatible:** Aminophylline, ascorbic acid injection, cefoperazone, cefotaxime, cefotetan, cefuroxime, dexamethasone sodium phosphate, diazepam, digoxin, dobutamine, folic acid, furosemide, hydrocortisone sodium phosphate, hydrocortisone sodium succinate, ketamine, methylprednisolone sodium succinate, minocycline, thiopental, ticarcillin.

Compatibility when admixed: Incompatible: Aminophylline, sodium bicarbonate, thiopental.

ContraindicationsHypersensitivity to doxapram or any component of the formulation; cardiovascular disease, cerebral edema, cerebral vascular accident, epilepsy, head injury, hyperthyroidism, mechanical disorders of ventilation, mechanical ventilation or neuromuscular blockade, pheochromocytoma, pulmonary embolism, or severe hypertension
Warnings/Precautions

Concerns related to adverse effects:

- CNS toxicity: May cause severe CNS toxicity, including seizures.

Disease-related concerns:

- Cerebrovascular disease: Use with caution in patients with cerebral disease; lowered pCO_2 induced by hyperventilation produces cerebral vasoconstriction and decreased circulation.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Renal impairment: Use with caution in patients with renal impairment.

- Respiratory disease: Use with caution in treating pulmonary disease; a pressor effect on pulmonary circulation may result in a fall in arterial pO_2.

Concurrent drug therapy issues:

- Volatile anesthetics: If patient has received anesthesia with a volatile agent known to sensitize the myocardium to catecholamines, avoid use of doxapram until anesthetic has been eliminated.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Dosage form specific issues:

- Benzyl alcohol: Solution contains benzyl alcohol which has been associated with "gasping syndrome" in neonates.

Other warnings/precautions:

- Administration: Hemolysis may result from rapid infusion.

- Appropriate use: Adequate airway required; consider airway protection in case of vomiting. Resuscitative equipment (in addition to anticonvulsants and oxygen) should be readily available. Doxapram is neither a nonspecific CNS depressant antagonist nor an opiate antagonist.

Pregnancy Risk FactorB
Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies.
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsFrequency not defined.

Cardiovascular: Arrhythmia, blood pressure increased, chest pain, chest tightness, flushing, heart rate changes, T waves lowered, ventricular tachycardia, ventricular fibrillation

Central nervous system: Apprehension, Babinski turns positive, disorientation, dizziness, hallucinations, headache, hyperactivity, pyrexia, seizure

Dermatologic: Burning sensation, pruritus

Gastrointestinal: Defecation urge, diarrhea, nausea, vomiting

Genitourinary: Spontaneous voiding, urinary retention

Hematologic: Hematocrit decreased, hemoglobin decreased, hemolysis, red blood cell count decreased

Local: Phlebitis

Neuromuscular & skeletal: Clonus, deep tendon reflexes increase, fasciculations, involuntary muscle movement, muscle spasm, paresthesia

Ocular: Pupillary dilatation

Renal: Albuminuria, BUN increased

Respiratory: Bronchospasm, cough, dyspnea, hiccups, hyperventilation, laryngospasm, rebound hypoventilation, tachypnea

Miscellaneous: Diaphoresis

Drug Interactions

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Monitoring ParametersMonitor heart rate, blood pressure, reflexes, CNS status, ECG, arterial blood gases (COPD)
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as hydrochloride: 20 mg/mL (20 mL) [contains benzyl alcohol]

Generic AvailableYes
Mechanism of ActionStimulates respiration through action on respiratory center in medulla or indirectly on peripheral carotid chemoreceptors
Pharmacodynamics/Kinetics

Onset of action: Respiratory stimulation: I.V.: 20-40 seconds

Peak effect: 1-2 minutes

Duration: 5-12 minutes

Half-life elimination, serum: Adults: Mean: 3.4 hours

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause CNS stimulation, restlessness, irritability, or hallucinations
Mental Health: Effects on Psychiatric TreatmentMay cause hypertensive crisis if used with MAO inhibitors
Anesthesia and Critical Care Concerns/Other ConsiderationsBecause of doxapram's transient effect, doxapram should not be used as a drug of choice to treat anesthesia-induced respiratory depression.
Index TermsDoxapram Hydrochloride
References

Doxazosin

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Doxazosin may be confused with doxapram, doxepin, DOXOrubicin

Cardura® may be confused with Cardene®, Cordarone®, Cordran®, Coumadin®, K-Dur®, Ridaura®

Pronunciation(doks AY zoe sin)
U.S. Brand NamesCardura®; Cardura® XL
Canadian Brand NamesAlti-Doxazosin; Apo-Doxazosin®; Cardura-1™; Cardura-2™; Cardura-4™; Gen-Doxazosin; Novo-Doxazosin
Pharmacologic CategoryAlpha $_1$ Blocker
Use: Labeled IndicationsTreatment of hypertension alone or in conjunction with diuretics, ACE inhibitors, beta-blockers, or calcium antagonists; treatment of urinary outflow obstruction and/or obstructive and irritative symptoms associated with benign prostatic hyperplasia (BPH), particularly useful in patients with troublesome symptoms who are unable or unwilling to undergo invasive procedures, but who require rapid symptomatic relief; can be used in combination with finasteride
Use: Unlabeled/InvestigationalPediatric hypertension
Dosing: Adults

Hypertension: Oral: Immediate release: 1 mg once daily in morning or evening; may be increased to 2 mg once daily. Thereafter titrate upwards, if needed, over several weeks, balancing therapeutic benefit with doxazosin-induced postural hypotension. Maximum dose: 16 mg/day

BPH: Oral:

Immediate release: 1 mg once daily in morning or evening; may be increased to 2 mg once daily. Thereafter titrate upwards, if needed, over several weeks, balancing therapeutic benefit with doxazosin-induced postural hypotension. Goal: 4-8 mg/day; maximum dose: 8 mg/day

Extended release: 4 mg once daily with breakfast; titrate based on response and tolerability every 3-4 weeks to maximum recommended dose of 8 mg/day. Reinitiation of therapy: If therapy is discontinued for several days, restart at 4 mg dose and titrate as before.

Note: Conversion to extended release from immediate release: Initiate with 4 mg once daily; omit final evening dose of immediate release prior to starting morning dosing with extended release product.

Dosing: ElderlyImmediate release: Oral: Initial: 0.5 mg once daily
Dosing: PediatricHypertension (unlabeled use): Oral: Immediate release: Initial: 1 mg once daily; maximum: 4 mg/day
Dosing: Hepatic ImpairmentUse with caution in mild-to-moderate hepatic dysfunction. Do not use with severe impairment.
Administration: OralCardura ® XL: Tablets should be swallowed whole; do not crush, chew, or divide.
Dietary ConsiderationsCardura® XL: Take with morning meal.
ContraindicationsHypersensitivity to quinazolines (prazosin, terazosin), doxazosin, or any component of the formulation
Allergy Considerations

- Alpha-Blocker, Piperazinyl Quinazoline Allergy

Warnings/Precautions

Concerns related to adverse effects:

• Angina: Discontinue if symptoms of angina occur or worsen.

• Floppy iris syndrome: Intraoperative floppy iris syndrome has been observed in cataract surgery patients who were on or were previously treated with alpha$_1$-blockers; causality has not been established and there appears to be no benefit in discontinuing alpha-blocker therapy prior to surgery.

• Orthostatic hypotension/syncope: Can cause significant orthostatic hypotension and syncope, especially with first dose; anticipate a similar effect if therapy is interrupted for a few days, if dosage is rapidly increased, or if another antihypertensive drug (particularly vasodilators) or a PDE-5 inhibitor is introduced. Patients should be cautioned about performing hazardous tasks when starting new therapy or adjusting dosage upward.

Disease-related concerns:

• Hepatic impairment: Use with caution in patients with mild to moderate hepatic impairment; not recommended in severe dysfunction.

• Prostate cancer: Should rule out prostatic carcinoma before beginning therapy.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Extended release formulation: Consists of drug within a nondeformable matrix; following drug release/absorption, the matrix/shell is expelled in the stool. The use of nondeformable products in patients with known stricture/narrowing of the GI tract has been associated with symptoms of obstruction. Use caution in patients with increased GI retention (eg, chronic constipation) as doxazosin exposure may be increased. Extended release formulation is not approved for the treatment of hypertension.

Geriatric ConsiderationsAdverse reactions such as dry mouth and urinary problems can be particularly bothersome in the elderly. In studies of the extended-release tablets, the incidence of hypotension was higher in the elderly compared to younger patients.

Pregnancy Risk FactorC

Pregnancy ConsiderationsSome studies demonstrated embryolethality resulting from doxazosin exposure during organogenesis. Delayed postnatal development was also noted. There are no adequate and well-controlled studies in pregnant women. Use only if benefit outweighs risk.

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions**Note:** Type and frequency of adverse reactions reflect combined data from trials with immediate release and extended release products.

>10%: Central nervous system: Dizziness (5% to 19%), headache (5% to 14%)

1% to 10%:

Cardiovascular: Orthostatic hypotension (dose related; 0.3% up to 2%), edema (3% to 4%), hypotension (2%), palpitation (1% to 2%), chest pain (1% to 2%), arrhythmia (1%), syncope (2%), flushing (1%)

Central nervous system: Fatigue (8% to 12%), somnolence (1% to 5%), nervousness (2%), pain (2%), vertigo (2% to 4%), insomnia (1%), anxiety (1%), paresthesia (1%), movement disorder (1%), ataxia (1%), hypertonia (1%), depression (1%)

Dermatologic: Rash (1%), pruritus (1%)

Endocrine & metabolic: Sexual dysfunction (2%)

Gastrointestinal: Abdominal pain (2%), diarrhea (2%), dyspepsia (1% to 2%), nausea (1% to 3%), xerostomia (1% to 2%), constipation (1%), flatulence (1%)

Genitourinary: Urinary tract infection (1%), impotence (1%), polyuria (2%), incontinence (1%)

Neuromuscular & skeletal: Back pain (2% to 3%), weakness (1% to 7%), arthritis (1%), muscle weakness (1%), myalgia (≤1%), muscle cramps (1%)

Ocular: Abnormal vision (1% to 2%), conjunctivitis (1%)

Otic: Tinnitus (1%)

Respiratory: Respiratory tract infection (5%), rhinitis (3%), dyspnea (1% to 3%), respiratory disorder (1%), epistaxis (1%)

Miscellaneous: Diaphoresis increased (1%), flu-like syndrome (1%)

<1% (Limited to important or life-threatening): Abnormal lacrimation, abnormal thinking, agitation, alopecia, amnesia, angina, anorexia, appetite, bradycardia, breast pain, bronchospasm, confusion, cough, depersonalization, dry skin, earache, eczema, emotional lability, fecal incontinence, fever, gastroenteritis, gout, hot flashes, hypoesthesia, hypokalemia, impaired concentration, infection, leukopenia, lymphadenopathy, migraine, MI, neutropenia, pallor, paranoia, paresis, parosmia, peripheral ischemia, purpura, renal calculus, rigors stroke, syncope, tachycardia

Postmarketing and/or case reports: Allergic reaction, cataplexy, cerebrovascular accident, cholestasis, enuresis, hematuria, hepatitis, intraoperative floppy iris syndrome (cataract surgery), jaundice, liver function tests increased, micturition abnormality, nocturia, paresthesia, priapism, purpura, systemic lupus erythematosus, thrombocytopenia, vomiting

Drug Interactions

Alfuzosin: Alpha1-Blockers may enhance the antihypertensive effect of Alfuzosin. Risk of orthostatic hypotension or syncope may be increased. Alfuzosin may enhance the antihypertensive effect of Alpha1-Blockers. *Risk X: Avoid combination*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Beta-Blockers: May enhance the orthostatic effect of Alpha1-Blockers. The risk associated with ophthalmic products is probably less than systemic products. **Exceptions:** Levobunolol; Metipranolol. *Risk D: Consider therapy modification*

Calcium Channel Blockers: Alpha1-Blockers may enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Phosphodiesterase 5 Inhibitors: May enhance the hypotensive effect of Alpha1-Blockers. *Risk D: Consider therapy modification*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Tamsulosin: Alpha1-Blockers may enhance the antihypertensive effect of Tamsulosin. Risk of orthostatic hypotension or syncope may be increased. Tamsulosin may enhance the antihypertensive effect of Alpha1-Blockers. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid dong quai if using for hypertension (has estrogenic activity). Avoid ephedra, yohimbe, ginseng (may worsen hypertension). Avoid saw palmetto when used for BPH (due to limited experience with this combination). Avoid garlic (may have increased antihypertensive effect).

Monitoring ParametersBlood pressure, standing and sitting/supine; syncope may occur usually within 90 minutes of the initial dose

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents or herbal products patient may be taking. Assess results of laboratory tests, therapeutic effectiveness (blood pressure), and adverse reactions (eg, hypotension, CNS changes, urinary retention) at beginning of therapy and on a regular basis with long-term therapy. When discontinuing, blood pressure should be closely monitored and dose tapered slowly over 1 week or more. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsWhite blood count

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take as directed, at bedtime. Do not skip dose or discontinue without consulting prescriber. Do not crush or chew extended release forms, swallow whole. Tablet shell may be visible in the stool. Follow recommended diet and exercise program. May cause drowsiness, dizziness, or impaired judgment (use caution when driving or engaging in tasks that require alertness until response to drug is known); postural hypotension (use caution when rising from sitting or lying position or when climbing stairs); or dry mouth or nausea (frequent mouth care or sucking lozenges may help). Report increased nervousness or depression; sudden weight gain (weigh yourself in the same clothes at the same time of day once a week); unusual or persistent swelling of ankles, feet, or extremities; palpitations or rapid heartbeat; muscle weakness, fatigue, or pain; or other persistent side effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 1 mg, 2 mg, 4 mg, 8 mg

Cardura®: 1 mg, 2 mg, 4 mg, 8 mg

Tablet, extended release:

Cardura® XL: 4 mg, 8 mg

Generic AvailableYes: Excludes extended release tablet

ManufacturerPfizer U.S. Pharmaceuticals Group

Pricing: U.S. (www.drugstore.com)

Tablets (Cardura)

1 mg (30): $47.32

2 mg (30): $47.32

4 mg (30): $50.10

8 mg (30): $53.54

Tablets (Doxazosin Mesylate)

1 mg (30): $17.99

2 mg (30): $19.99

4 mg (30): $21.99

8 mg (30): $23.99

Mechanism of Action

Hypertension: Competitively inhibits postsynaptic alpha$_1$-adrenergic receptors which results in vasodilation of veins and arterioles and a decrease in total peripheral resistance and blood pressure; ~50% as potent on a weight by weight basis as prazosin.

BPH: Competitively inhibits postsynaptic alpha$_1$-adrenergic receptors in prostatic stromal and bladder neck tissues. This reduces the sympathetic tone-induced urethral stricture causing BPH symptoms.

Pharmacodynamics/KineticsNot significantly affected by increased age

Duration: >24 hours

Protein binding: Extended release: 98%

Metabolism: Extensively hepatic to active metabolites; primarily via CYP3A4; secondary pathways involve CYP2D6 and 2C19

Bioavailability: Extended release relative to immediate release: 54% to 59%

Half-life elimination: 15-22 hours

Time to peak, serum: Immediate release: 2-3 hours; extended release: 8-9 hours

Excretion: Feces (63% primarily as metabolites); urine (9%)

Pharmacotherapy Pearls First-dose hypotension occurs less frequently with doxazosin as compared to prazosin; this may be due to its slower onset of action.

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation) and orthostatic hypotension

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status Dizziness is common.

Mental Health: Effects on Psychiatric Treatment Psychotropics may potentiate the hypotensive effects of doxazosin

Cardiovascular Considerations Doxazosin may be used in combination with other agents for the treatment of hypertension or alone in select patients who fail to respond or have contraindications to other agents. Patients with BPH may derive an extra benefit from therapy. Recently, the doxazosin treatment arm of ALLHAT (Antihypertensive and Lipid-Lowering Treatment to Prevent Heart Attack Trial) was prematurely stopped due to a significantly higher incidence (25%) of cardiovascular events, particularly heart failure events, compared to the diuretic (chlorthalidone) treatment arm. This unfavorable difference was also present when doxazosin was compared to the amlodipine and lisinopril treatment arms. This study does not address cardiovascular outcomes when doxazosin is combined with other antihypertensive medications.

Index Terms Doxazosin Mesylate

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Doxepin may be confused with digoxin, doxapram, doxazosin, Doxidan®, doxycycline

Sinequan® may be confused with saquinavir, Serentil®, Seroquel®, Singulair®

Zonalon® may be confused with Zone-A Forte®

International issues:

Doxal® [Finland] may be confused with Doxil® which is a brand name for doxorubicin in the U.S.

Doxal® [Finland]: Brand name for doxycycline in Austria; brand name for pyridoxine/thiamine in Brazil

Pronunciation(DOKS e pin)

U.S. Brand NamesPrudoxin™; Sinequan® [DSC]; Zonalon®

Canadian Brand NamesApo-Doxepin®; Novo-Doxepin; Sinequan®; Zonalon®

Pharmacologic CategoryAntidepressant, Tricyclic (Tertiary Amine); Topical Skin Product

Use: Labeled Indications

Oral: Depression

Topical: Short-term (<8 days) management of moderate pruritus in adults with atopic dermatitis or lichen simplex chronicus

Use: Unlabeled/InvestigationalAnalgesic for certain chronic and neuropathic pain; anxiety

Use: DentalCream: Treatment of burning mouth syndrome and neuropathic pain

Dosing: Adults

Depression and/or anxiety (unlabeled use): Oral: Initial: 25-150 mg/day at bedtime or in 2-3 divided doses; may gradually increase up to 300 mg/day; single dose should not exceed 150 mg; select patients may respond to 25-50 mg/day.

Chronic urticaria, angioedema, nocturnal pruritus: Oral: 10-30 mg/day

Pruritus: Topical: Apply a thin film 4 times/day with at least 3- to 4-hour interval between applications; not recommended for use >8 days. (Oral administration of doxepin 25-50 mg has also been used, but systemic adverse effects are increased.)

Dosing: Elderly

Depression and/or anxiety (unlabeled use): Oral: Initial: 10-25 mg at bedtime; increase by 10-25 mg every 3 days for inpatients and weekly for outpatients if tolerated. Rarely does the maximum dose required exceed 75 mg/day; a single bedtime dose is recommended.

Pruritus: Topical: Refer to adult dosing.

Dosing: Pediatric

Depression and/or anxiety: Oral:

Children (unlabeled use): 1-3 mg/kg/day in single or divided doses

Adolescents: Initial: 25-50 mg/day in single or divided doses; gradually increase to 100 mg/day

Dosing: Hepatic ImpairmentUse a lower dose and adjust gradually.

Administration: OralDo not mix oral concentrate with carbonated beverages (physically incompatible).

Administration: TopicalApply thin film to affected area; use of occlusive dressings is not recommended.

StorageProtect from light.

RestrictionsAn FDA-approved medication guide concerning the use of antidepressants in children, adolescents, and young adults must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm. Dispense to parents or guardians of children and adolescents receiving this medication.

ContraindicationsHypersensitivity to doxepin, drugs from similar chemical class, or any component of the formulation; narrow-angle glaucoma; urinary retention; use of MAO inhibitors within 14 days; use in a patient during acute recovery phase of MI

Allergy Considerations

- Tricyclic Antidepressant and Related Compounds Allergy

Warnings/Precautions

Boxed warnings:

- Suicidal thinking/behavior: See “Major psychiatric warnings” below.

Major psychiatric warnings:

- **[U.S. Boxed Warning]: Antidepressants increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 years of age) with major depressive disorder (MDD) and other psychiatric disorders;** consider risk prior to prescribing. Short-term studies did not show an increased risk in patients >24 years of age and showed a decreased risk in patients ≥65 years. Closely monitor patients for clinical worsening, suicidality, or unusual changes in behavior, particularly during the initial 1-2 months of therapy or during periods of dosage adjustments (increases or decreases); the patient’s family or caregiver should be instructed to closely observe the patient and communicate condition with healthcare provider. A medication guide concerning the use of antidepressants should be dispensed with each prescription. **Doxepin is approved for treatment of depression in adolescents.**

- The possibility of a suicide attempt is inherent in major depression and may persist until remission occurs. Patients treated with antidepressants should be observed for clinical worsening and suicidality, especially during the initial few months of a course of drug therapy, or at times of dose changes, either increases or decreases. Worsening depression and severe abrupt suicidality that are not part of the presenting symptoms may require discontinuation or modification of drug therapy. Use caution in high-risk patients during initiation of therapy.

- Prescriptions should be written for the smallest quantity consistent with good patient care. The patient's family or caregiver should be alerted to monitor patients for the emergence of suicidality and associated behaviors such as anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, and mania; patients should be instructed to notify their healthcare provider if any of these symptoms or worsening depression or psychosis occur.

- May worsen psychosis in some patients or precipitate a shift to mania or hypomania in patients with bipolar disorder. Monotherapy in patients with bipolar disorder should be avoided. Patients presenting with depressive symptoms should be screened for bipolar disorder. **Doxepin is not FDA approved for the treatment of bipolar depression.**

Concerns related to adverse effects:

- Anticholinergic effects: May cause anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention); use with caution in patients with decreased gastrointestinal motility, paralytic ileus, urinary retention, BPH, xerostomia, or visual problems. The degree of anticholinergic blockade produced by this agent is high relative to other antidepressants.

- Orthostatic hypotension: May cause orthostatic hypotension (risk is moderate relative to other antidepressants); use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).

- Sedation: May cause sedation, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving). The degree of sedation is very high relative to other antidepressants.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with a history of cardiovascular disease (including previous MI, stroke, tachycardia, or conduction abnormalities); the risk conduction abnormalities with this agent is moderate relative to other antidepressants.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Renal impairment: Use with caution in patients with renal impairment.

- Seizure disorder: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold.

- Thyroid dysfunction: Use with caution in patients with hyperthyroidism or those receiving thyroid supplementation.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly.

Dosage form specific issues:

- Topical: Cream formulation is for external use only (not for ophthalmic, vaginal, or oral use). Do not use occlusive dressings. Use for >8 days may increase risk of contact sensitization. Doxepin is significantly absorbed following topical administration; plasma levels may be similar to those achieved with oral administration.

Other warnings/precautions:

- Discontinuation of therapy: Therapy should not be abruptly discontinued in patients receiving high doses for prolonged periods.

- Electroconvulsive therapy: May increase the risks associated with electroconvulsive therapy; consider discontinuing, when possible, prior to ECT treatment.

Geriatric ConsiderationsThe oral form is the preferred agent when sedation is a desired property. Less potential for anticholinergic effects than amitriptyline and less orthostatic hypotension than imipramine. However, dosing should be approached cautiously, initiated at the low end of the dosage range. The pharmacokinetics of doxepin have not been studied in elderly patients. Data from a clinical trial comparing fluoxetine to tricyclics suggest that fluoxetine is significantly less effective than nortriptyline in hospitalized elderly patients with unipolar major affective disorder, especially those with melancholia and concurrent cardiovascular disease.

Pregnancy Risk FactorB (cream); C (all other forms)

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies; however, there are no adequate and well-controlled studies in pregnant women. Use during pregnancy only if clearly needed.

LactationEnters breast milk/not recommended (AAP rates "of concern")

Breast-Feeding ConsiderationsGenerally, it is not recommended to breast-feed if taking antidepressants because of the long half-life, active metabolites, and the potential for side effects in the infant.

Adverse Reactions

Oral: Frequency not defined.

Cardiovascular: Hyper-/hypotension, tachycardia

Central nervous system: Drowsiness, dizziness, headache, disorientation, ataxia, confusion, seizure

Dermatologic: Alopecia, photosensitivity, rash, pruritus

Endocrine & metabolic: Blood sugar increased/decreased, breast enlargement, galactorrhea, libido increased/decreased, SIADH

Gastrointestinal: Xerostomia, constipation, vomiting, indigestion, anorexia, aphthous stomatitis, nausea, unpleasant taste, weight gain, diarrhea, trouble with gums, lower esophageal sphincter tone decrease may cause GE reflux

Genitourinary: Urinary retention, testicular edema

Hematologic: Agranulocytosis, leukopenia, eosinophilia, thrombocytopenia, purpura

Neuromuscular & skeletal: Weakness, tremor, numbness, paresthesia, extrapyramidal symptoms, tardive dyskinesia

Ocular: Blurred vision

Otic: Tinnitus

Miscellaneous: Diaphoresis (excessive), allergic reactions

Topical:

>10%:

Central nervous system: Drowsiness (22%)

Dermatologic: Stinging/burning (23%)

1% to 10%:

Cardiovascular: Edema: (1%)

Central nervous system: Dizziness (2%), emotional changes (2%)

Gastrointestinal: Xerostomia (10%), taste alteration (2%)

<1%: Contact dermatitis, tongue numbness, anxiety

Metabolism/Transport Effects**Substrate** (major) of CYP1A2, 2D6, 3A4

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): Tricyclic Antidepressants may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha1-Agonists: Tricyclic Antidepressants may enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Alpha2-Agonists: Tricyclic Antidepressants may diminish the antihypertensive effect of Alpha2-Agonists. **Exceptions:** Apraclonidine; Brimonidine. *Risk D: Consider therapy modification*

Altretamine: May enhance the orthostatic effect of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Amphetamines: Tricyclic Antidepressants may enhance the stimulatory effect of Amphetamines. Tricyclic Antidepressants may also potentiate the cardiovascular effects of Amphetamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Aspirin: Antidepressants (Tricyclic, Tertiary Amine) may enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Beta2-Agonists: Tricyclic Antidepressants may enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

BuPROPion: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Cinacalcet: May increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP1A2 Inducers (Strong): May increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Desmopressin: Tricyclic Antidepressants may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Dexmethylphenidate: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

DULoxetine: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Iobenguane I 123: Tricyclic Antidepressants may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Lithium: May enhance the neurotoxic effect of Tricyclic Antidepressants. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the serotonergic effect of Tricyclic Antidepressants. This may cause serotonin syndrome. *Risk X: Avoid combination*

Methylphenidate: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

NSAID (COX-2 Inhibitor): Antidepressants (Tricyclic, Tertiary Amine) may enhance the antiplatelet effect of NSAID (COX-2 Inhibitor). *Risk C: Monitor therapy*

NSAID (Nonselective): Antidepressants (Tricyclic, Tertiary Amine) may enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Propoxyphene: May enhance the CNS depressant effect of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Protease Inhibitors: May increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

QuiNIDine: Tricyclic Antidepressants may enhance the QTc-prolonging effect of QuiNIDine. QuiNIDine may decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

St Johns Wort: May increase the metabolism of Tricyclic Antidepressants. The risk of serotonin syndrome may theoretically be increased. *Risk D: Consider therapy modification*

Sulfonylureas: Cyclic Antidepressants may enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

Terbinafine: May decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

TraMADol: Tricyclic Antidepressants may enhance the neuroexcitatory and/or seizure-potentiating effect of TraMADol. *Risk C: Monitor therapy*

Valproic Acid: May increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Tricyclic Antidepressants may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Grapefruit juice may inhibit the metabolism of some TCAs and clinical toxicity may result.

Herb/Nutraceutical: Avoid valerian, St John's wort, SAMe, kava kava (may increase risk of serotonin syndrome and/or excessive sedation).

Test InteractionsIncreased glucose

Monitoring ParametersMonitor blood pressure and pulse rate prior to and during initial therapy; monitor mental status, suicidal ideation (especially at the beginning of therapy or when doses are increased or decreased); weight; ECG in older adults; adverse effects may be increased if topical formulation is applied to >10% of body surface area

Reference RangeProposed therapeutic concentration (doxepin plus desmethyldoxepin): 110-250 ng/mL. Toxic concentration (doxepin plus desmethyldoxepin): >500 ng/mL. Utility of serum level monitoring is controversial.

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions at beginning of therapy and periodically with long-term use. Monitor CNS status. Be alert for signs of clinical worsening, suicidal ideation, or other changes in behavior. Taper dosage slowly when discontinuing. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient Education**Oral:** Take exactly as directed; do not increase dose or frequency. It may take several weeks to achieve desired results. Avoid alcohol, caffeine, and other prescription or OTC medications not approved by prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, lightheadedness, impaired coordination, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); constipation (increased exercise, fluids, fruit, or fiber may help); urinary retention (void before taking medication); postural hypotension (use caution climbing stairs or when changing position from lying or sitting to standing); altered sexual drive or ability (reversible); or photosensitivity (use sunscreen, wear protective clothing and eyewear, and avoid direct sunlight). Report persistent CNS effects (eg, nervousness, restlessness, insomnia, anxiety, excitation, suicide ideation, headache, agitation, impaired coordination, changes in cognition); muscle cramping, weakness, tremors, or rigidity; chest pain, palpitations, or irregular heartbeat; blurred vision or eye pain; yellowing of skin or eyes; or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Topical: Use as directed. Apply in thin layer; do not overuse. Report increased skin irritation, worsening of condition or lack of improvement.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Capsule, as hydrochloride: 10 mg, 25 mg, 50 mg, 75 mg, 100 mg, 150 mg

Sinequan®: 10 mg, 25 mg, 50 mg, 75 mg, 100 mg, 150 mg [DSC]

Cream, as hydrochloride:

Prudoxin™: 5% (45 g) [contains benzyl alcohol]

Zonalon®: 5% (30 g, 45 g) [contains benzyl alcohol]

Solution, oral concentrate, as hydrochloride: 10 mg/mL (120 mL)

Sinequan®: 10 mg/mL (120 mL) [DSC]

Generic AvailableYes: Capsule, solution

Pricing: U.S. (www.drugstore.com)

Capsules (Doxepin HCl)

10 mg (90): $19.00

25 mg (60): $13.99

50 mg (60): $14.99

75 mg (30): $8.99

100 mg (30): $13.99

Capsules (Sinequan)

50 mg (60): $55.84

Concentrate (Doxepin HCl)

10 mg/mL (120): $16.00

Cream (Prudoxin)

5% (45): $95.14

Cream (Zonalon)

5% (30): $116.58

5% (45): $138.60

Mechanism of ActionIncreases the synaptic concentration of serotonin and norepinephrine in the central nervous system by inhibition of their reuptake by the presynaptic neuronal membrane

Pharmacodynamics/Kinetics

Onset of action: Peak effect: Antidepressant: Usually >2 weeks; Anxiolytic: may occur sooner

Absorption: Following topical application, plasma levels may be similar to those achieved with oral administration

Distribution: Crosses placenta; enters breast milk

Protein binding: 80% to 85%

Metabolism: Hepatic; metabolites include desmethyldoxepin (active)

Half-life elimination: Adults: 6-8 hours

Excretion: Urine

Dental Health Professional ConsiderationsDoxepin is known to prolong the QT interval. The QT interval is measured as the time and distance between the Q point of the QRS complex and the end of the T wave in the ECG tracing. After adjustment for heart rate, the QT interval is defined as prolonged if it is more than 450 msec in men and 460 msec in women. A long QT syndrome was first described in the 1950s and 60s as a congenital syndrome involving QT interval prolongation and syncope and sudden death. Some of the congenital long QT syndromes were characterized by a peculiar electrocardiographic appearance of the QRS complex involving a premature atria beat followed by a pause, then a subsequent sinus beat showing marked QT prolongation and deformity. This type of cardiac arrhythmia was originally termed “torsade de pointes” (translated from the French as “twisting of the points”).

Prolongation of the QT interval is thought to result from delayed ventricular repolarization. The repolarization process within the myocardial cell is due to the efflux of intracellular potassium. The channels associated with this current can be blocked by many drugs and predispose the electrical propagation cycle to torsade de pointes.

Doxepin is considered as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. It is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation)

Oral: Aphthous stomatitis, unpleasant taste, trouble with gums

Topical: Taste alteration

Long-term treatment with TCAs increases the risk of caries by reducing salivation and salivary buffer capacity.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsDoxepin is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution. See Dental Comment.

Mental Health CommentTricyclic antidepressants may be classified as tertiary (amitriptyline, doxepin, clomipramine, imipramine, trimipramine) or secondary amines (nortriptyline, desipramine, protriptyline). The tertiary amines are not recommended to treat depression in the elderly. If a TCA is used in the elderly, it should be a secondary amine. The tertiary amines are commonly used in low dosages for various conditions associated with pain. Toxicity is generally dose dependent. Relatively small overdoses (1-week supply) can be potentially fatal.

Index TermsDoxepin Hydrochloride

Pronunciation(doks er kal si fe FEER ole)

U.S. Brand NamesHectorol®

Canadian Brand NamesHectorol®

Pharmacologic CategoryVitamin D Analog

Use: Labeled IndicationsTreatment of secondary hyperparathyroidism in patients with chronic kidney disease

Dosing: AdultsSecondary hyperparathyroidism:

Oral:

Dialysis patients: Dose should be titrated to lower iPTH to 150-300 pg/mL; dose is adjusted at 8-week intervals (maximum dose: 20 mcg 3 times/week)

Initial dose: iPTH >400 pg/mL: 10 mcg 3 times/week at dialysis

Dose titration:

iPTH level decreased by 50% and >300 pg/mL: Dose can be increased to 12.5 mcg 3 times/week for 8 more weeks; this titration process can continue at 8-week intervals; each increase should be by 2.5 mcg/dose

iPTH level 150-300 pg/mL: Maintain current dose

iPTH level <100 pg/mL: Suspend doxercalciferol for 1 week; resume at a reduced dose; decrease each dose (not weekly dose) by at least 2.5 mcg

Predialysis patients: Dose should be titrated to lower iPTH to 35-70 pg/mL with stage 3 disease or to 70-110 pg/mL with stage 4 disease: Dose may be adjusted at 2-week intervals (maximum dose: 3.5 mcg/day)

Initial dose: 1 mcg/day

Dose titration:

iPTH level >70 pg/mL with stage 3 disease or >110 pg/mL with stage 4 disease: Increase dose by 0.5 mcg every 2 weeks as necessary

iPTH level 35-70 pg/mL with stage 3 disease or 70-110 pg/mL with stage 4 disease: Maintain current dose

iPTH level is <35 pg/mL with stage 3 disease or <70 pg/mL with stage 4 disease: Suspend doxercalciferol for 1 week, then resume at a reduced dose (at least 0.5 mcg lower)

I.V.:

Dialysis patients: Dose should be titrated to lower iPTH to 150-300 pg/mL; dose is adjusted at 8-week intervals (maximum dose: 18 mcg/week)

Initial dose: iPTH level >400 pg/mL: 4 mcg 3 times/week after dialysis, administered as a bolus dose

Dose titration:

iPTH level decreased by <50% and >300 pg/mL: Dose can be increased by 1-2 mcg at 8-week intervals, as necessary

iPTH level decreased by >50% and >300 pg/mL: Maintain current dose

iPTH level 150-300 pg/mL: Maintain the current dose

iPTH level <100 pg/mL: Suspend doxercalciferol for 1 week; resume at a reduced dose (at least 1 mcg lower)

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNo adjustment is required.

Dosing: Hepatic ImpairmentUse caution in these patients; no guidelines for dosage adjustment.

Dietary ConsiderationsBased on serum levels, dietary phosphorus may be restricted and/or controlled with calcium-based phosphorus binders. The daily combined calcium intake (dietary and calcium based phosphate binder) should be 1.5-2 g. Additional vitamin D supplements and magnesium-containing antacids should be avoided. Capsules contain coconut oil.

StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F). The injection should be protected from light.

ContraindicationsHypersensitivity to any component of the formulation; history of hypercalcemia or evidence of vitamin D toxicity

Warnings/Precautions

Concerns related to adverse effects:

- Excessive vitamin D: Excessive vitamin D administration may lead to over suppression of PTH, progressive or acute hypercalcemia, hypercalciuria, hyperphosphatemia and adynamic bone disease.

- Hypercalcemia: Progressive and/or acute hypercalcemia may increase risk of cardiac arrhythmias and seizures; chronic hypercalcemia may lead to generalized vascular and other soft-tissue calcification. Phosphate and vitamin D (and its derivatives) should be withheld during therapy to avoid hypercalcemia.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Hyperphosphatemia: Should be corrected before initiating therapy; exacerbates secondary hyperparathyroidism, diminishing the effect of doxercalciferol.

Concurrent drug therapy issues:

- Cardiac glycosides: Use with caution in patients taking cardiac glycosides; digitalis toxicity is potentiated by hypocalcemia.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Injection: Intended for I.V. use only.

Other warnings/precautions:

- Appropriate use: Other forms of vitamin D should be discontinued when doxercalciferol is started.

Geriatric ConsiderationsNo special changes in dose are required. Caution should be used in the elderly using magnesium products (MOM, magnesium containing antacids, etc). These should be stopped if possible before initiating doxercalciferol.

Pregnancy Risk FactorB

Pregnancy ConsiderationsReproduction in animals (usual and high dose) do not reveal teratogenic or fetotoxic effects.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsExcretion in breast milk is unknown. Other vitamin D derivatives are excreted in breast milk; there is a potential for adverse effects. Therefore, the manufacturer recommends that breast-feeding be discontinued or doxercalciferol discontinued, depending upon importance of the drug to the mother.

Adverse Reactions

Note: As reported in dialysis patients.

>10%:

Cardiovascular: Edema (34%)

Central nervous system: Headache (28%), malaise (28%), dizziness (12%)

Gastrointestinal: Nausea/vomiting (24%)

Respiratory: Dyspnea (12%)

1% to 10%:

Cardiovascular: Bradycardia (7%)

Central nervous system: Sleep disorder (3%)

Dermatologic: Pruritus (8%)

Gastrointestinal: Anorexia (5%), constipation (3%), dyspepsia (5%), weight gain (5%)

Neuromuscular & skeletal: Arthralgia (5%)

Miscellaneous: Abscess (3%)

Drug InteractionsThere are no known significant interactions.

Monitoring Parameters

Dialysis patients: Before initiating, check iPTH, serum calcium and phosphorus. Check weekly thereafter until stable. Serum iPTH, calcium, phosphorus, and alkaline phosphatase should be monitored.

Predialysis patients: iPTH, serum calcium and phosphorus every 2 weeks for 3 months following initiation and dose adjustments, then monthly for 3 months, then every 3 months

Reference RangeSerum calcium times phosphorus product should be >55 mg^2/dL^2 with chronic kidney disease

Target range by stage of chronic kidney disease:

Stage 3:

GFR 30-59 mL/minute: iPTH 35-70 pg/mL

Serum phosphorus: 2.7-4.6 mg/dL

Stage 4:

GFR 15-29 mL/minute: iPTH 70-110 pg/mL

Serum phosphorus: 2.7-4.6 mg/dL

Stage 5:

GFR <15 mL/minute or dialysis: iPTH 150-300 pg/mL

Serum phosphorus: 3.5-5.5 mg/dL

Nursing: Physical Assessment/MonitoringMonitor therapeutic effectiveness (laboratory results), adverse reactions. Monitor for fluid retention. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse reactions to report.

Monitoring: Lab Tests

Dialysis patients: Before initiating, check iPTH, serum calcium and phosphorus. Check weekly thereafter until stable. Serum iPTH, calcium, phosphorus, and alkaline phosphatase should be monitored.

Predialysis patients: iPTH, serum calcium and phosphorus every 2 weeks for 3 months following initiation and dose adjustments, then monthly for 3 months, then every 3 months.

Patient EducationBe clear on dose and directions for taking. Stop other vitamin D products. Do not miss doses. Avoid magnesium-containing antacids and supplements. Report headache, dizziness, weakness, sleepiness, severe nausea, vomiting, dry mouth, loss of appetite, constipation, metallic taste, muscle and/or bone pain, significant fluid retention, malaise, shortness of breath, and difficulty thinking or concentrating to your prescriber. Do not take over-the-counter medicines or supplements without first consulting your prescriber. Follow diet and calcium supplements as directed by your prescriber.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, softgel:

Hectorol®: 0.5 mcg, 2.5 mcg [contains coconut oil]

Injection, solution:

Hectorol®: 2 mcg/mL (2 mL) [contains disodium edetate]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Capsules (Hectorol)

0.5 mcg (50): $251.26

2.5 mcg (50): $875.96

Mechanism of ActionDoxercalciferol is metabolized to the active form of vitamin D. The active form of vitamin D controls the intestinal absorption of dietary calcium, the tubular reabsorption of calcium by the kidneys, and in conjunction with PTH, the mobilization of calcium from the skeleton.

Pharmacodynamics/Kinetics

Metabolism: Hepatic via CYP27

Half-life elimination: Active metabolite: 32-37 hours; up to 96 hours

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness and malaise are common; may cause confusion or sleep disorders

Mental Health: Effects on Psychiatric TreatmentNausea and vomiting are common; use caution with SSRIs

Pharmacologic CategoryChemotherapy Regimen, Multiple Myeloma
Regimen UseMultiple myeloma
Index TermsDVd; DVD
RegimenNOTE: Multiple variations are listed below.

Variation 1:

Doxorubicin, liposomal: I.V.: 40 mg/m^2 day 1

[total dose/cycle = 40 mg/m^2]

Vincristine: I.V.: 2 mg day 1

[total dose/cycle = 2 mg]

Dexamethasone: Oral or I.V.: 40 mg/day days 1 to 4

[total dose/cycle = 160 mg]

Repeat cycle every 4 weeks

Variation 2:

Doxorubicin, liposomal: I.V.: 40 mg/m^2 day 1

[total dose/cycle = 40 mg/m^2]

Vincristine: I.V.: 1.4 mg/m^2 (maximum 2 mg) day 1

[total dose/cycle = 1.4 mg/m^2; maximum 2 mg]

Dexamethasone: Oral: 40 mg/day days 1 to 4

[total dose/cycle = 160 mg]

Repeat cycle every 4 weeks

DOXOrubicin (Liposomal)

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

DOXOrubicin liposomal may be confused with DACTINomycin, DAUNOrubicin, DAUNOrubicin liposomal, doxacurium, doxapram, doxazosin, DOXOrubicin, epirubicin, IDArubicin

DOXOrubicin liposomal may be confused with DAUNOrubicin liposomal

Doxil® may be confused with Doxy®, Paxil®

Liposomal formulation (Doxil®) may be confused with the conventional formulation (Adriamycin PFS®, Adriamycin RDF®)

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Use caution when selecting product for preparation and dispensing; indications, dosages and adverse event profiles differ between conventional DOXOrubicin hydrochloride solution and DOXOrubicin liposomal. Both formulations are the same concentration. As a result, serious errors have occurred. Liposomal formulation of doxorubicin should NOT be substituted for doxorubicin hydrochloride on a mg-per-mg basis.

Pronunciation(doks oh ROO bi sin lip pah SOW mal)

U.S. Brand NamesDoxil®

Canadian Brand NamesCaelyx®

Pharmacologic CategoryAntineoplastic Agent, Anthracycline

Use: Labeled IndicationsTreatment of ovarian cancer, multiple myeloma, and AIDS-related Kaposi's sarcoma

Use: Unlabeled/InvestigationalTreatment of metastatic breast cancer

Dosing: AdultsRefer to individual protocols. **Liposomal formulations of doxorubicin should NOT be substituted for conventional doxorubicin hydrochloride on a mg-per-mg basis.**

AIDS-related Kaposi's sarcoma: I.V.: 20 mg/m^2/dose once every 3 weeks

Breast cancer (unlabeled use): I.V.: 50 mg/m^2/dose every 4 weeks

Multiple myeloma: I.V.: 30 mg/m^2/dose every 3 weeks (in combination with bortezomib) **or**

Unlabeled dosing: I .V.: 40 mg/m^2/dose every 4 weeks (in combination with vincristine and dexamethasone)

Ovarian cancer: I.V.: 50 mg/m^2/dose every 4 weeks

Dosing: ElderlyRefer to adult dosing.

Liposomal formulations of doxorubicin should NOT be substituted for conventional doxorubicin hydrochloride on a mg-per-mg basis.

Dosing: Hepatic Impairment **Liposomal formulations of doxorubicin should NOT be substituted for conventional doxorubicin hydrochloride on a mg-per-mg basis.**

ALT/AST 2-3 times ULN: Administer 75% of dose

ALT/AST >3 times ULN **or** bilirubin 1.2-3 mg/dL (20-51 µmol/L): Administer 50% of dose

Bilirubin 3.1-5 mg/dL (51-85 µmol/L): Administer 25% of dose

Bilirubin >5 mg/dL (85 µmol/L): Do not administer

Dosing: Adjustment for Toxicity

Liposomal formulations of doxorubicin should NOT be substituted for conventional doxorubicin hydrochloride on a mg-per-mg basis.

Toxicity Grade 1

ANC 1500-1900; platelets 75,000-150,000: Resume treatment with no dose reduction

Toxicity Grade 2

ANC 1000-<1500; platelets 50,000-<75,000: Wait until ANC ≥1500 and platelets ≥75,000; redose with no dose reduction

Toxicity Grade 3

ANC 500-999; platelets 25,000-<50,000: Wait until ANC ≥1500 and platelets ≥75,000; redose with no dose reduction

Toxicity Grade 4

ANC <500; platelets <25,000: Wait until ANC ≥1500 and platelets ≥75,000; redose at 25% dose reduction or continue full dose with cytokine support

Dosing adjustment for toxicity in treatment with bortezomib (for multiple myeloma) (see Bortezomib monograph for bortezomib dosage reduction with toxicity guidelines):

Fever ≥38°C and ANC <1000/mm^3*:* If prior to doxorubicin liposomal treatment (day 4), do not administer; if after doxorubicin liposomal administered, reduce dose by 25% in next cycle.

ANC<500/mm^3*, platelets <25,000/mm*^{3}*, hemoglobin <8 g/dL:* If prior to doxorubicin liposomal treatment (day 4); do not administer; if after doxorubicin liposomal administered, reduce dose by 25% in next cycle if bortezomib dose reduction occurred for hematologic toxicity.

Grade 3 or 4 nonhematologic toxicity: Delay dose until resolved to grade <2; reduce dose by 25% for all subsequent doses.

Neuropathic pain or peripheral neuropathy: No dose reductions needed for doxorubicin liposomal, refer to Bortezomib monograph for bortezomib dosing adjustment.

Dosing: Combination Regimens

Lymphoma, Hodgkin's: Gemcitabine-Vinorelbine-Doxorubicin (Liposomal)

Multiple myeloma:

Bortezomib-Doxorubicin (Liposomal)

Bortezomib-Doxorubicin (Liposomal)-Dexamethasone

Doxorubicin (Liposomal)-Vincristine-Dexamethasone

Calculations

- Body Surface Area: Adults

Administration: I.V.Irritant; avoid extravasation. Administer IVPB over 60 minutes; manufacturer recommends administering at initial rate of 1 mg/minute to minimize risk of infusion reactions until the absence of a reaction has been established, then increase the infusion rate for completion over 1 hour. **Do not administer intramuscular or subcutaneous**. **Do not infuse with in-line filters.**

Administration: I.V. DetailFlush with 5-10 mL of D$_5$W solution before and after drug administration, incompatible with heparin flushes. Monitor for local erythematous streaking along vein and/or facial flushing (may indicate rapid infusion rate).

StorageStore intact vials of solution under refrigeration at 2°C to 8°C (36°F to 46°F); avoid freezing. Prolonged freezing may adversely affect liposomal drug products, however, short-term freezing (<1 month) does not appear to have a deleterious effect. Diluted doxorubicin hydrochloride liposome injection may be refrigerated at 2°C to 8°C (36°F to 46°F); administer within 24 hours. **Do not infuse with in-line filters.**

ReconstitutionDoses of doxorubicin liposomal ≤90 mg must be diluted in 250 mL of D$_5$W prior to administration. Doses >90 mg should be diluted in 500 mL D$_5$W.

CompatibilityStable in D$_5$W.

Y-site administration: Compatible: Acyclovir, allopurinol, aminophylline, ampicillin, aztreonam, bleomycin, butorphanol, calcium gluconate, carboplatin, cefazolin, cefepime, cefoxitin, ceftizoxime, ceftriaxone, chlorpromazine, cimetidine, ciprofloxacin, cisplatin, clindamycin, co-trimoxazole, cyclophosphamide, cytarabine, dexamethasone sodium phosphate, diphenhydramine, dobutamine, dopamine, droperidol, enalaprilat, etoposide, famotidine, fluconazole, ganciclovir, gentamicin, granisetron, haloperidol, hydrocortisone sodium succinate, hydromorphone, ifosfamide, leucovorin, lorazepam, magnesium sulfate, mesna, methotrexate, methylprednisolone sodium succinate, metronidazole, netilmicin, ondansetron, piperacillin, potassium chloride, prochlorperazine edisylate, ranitidine, ticarcillin, ticarcillin/clavulanate, tobramycin, vancomycin, vinblastine, vincristine, vinorelbine, zidovudine. **Incompatible:** Amphotericin B, amphotericin B cholesteryl sulfate complex, buprenorphine, cefoperazone, ceftazidime, docetaxel, fluorouracil, furosemide, heparin, hydroxyzine, mannitol, meperidine, metoclopramide, mitoxantrone, morphine, ofloxacin, paclitaxel, piperacillin/tazobactam, promethazine, sodium bicarbonate.

ContraindicationsHypersensitivity to doxorubicin, other anthracyclines, or any component of the formulation; breast-feeding

Warnings/Precautions

Boxed warnings:

- Bone marrow suppression: See “Concerns related to adverse effects” below.
- Hepatic impairment: See “Disease-related concerns” below.
- Infusion-related reactions: See “Concerns related to adverse effects” below.
- Liposomal vs. conventional doxorubicin dosing: “Dosage form specific issues” below.
- Myocardial toxicity: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: **[U.S. Boxed Warning]: Severe myelosuppression may occur.** Delay in treatment or dosage modification may be required.

- Hand-foot syndrome: Palmar-plantar erythrodysesthesia has been reported in up to 51% of patients with ovarian cancer, 19% of patients with multiple myeloma, and ~3% in patients with Kaposi's sarcoma. May occur early in treatment, but is usually seen after 2-3 treatment cycles. Dosage modification may be required. In severe cases, treatment discontinuation may be required.

- Infusion-related reactions: **[U.S. Boxed Warning]: Acute infusion reactions may occur, some may be serious/life-threatening**, including fatal allergic/anaphylactoid-like reactions. May include flushing, dyspnea, facial swelling, chills, back pain, hypotension and/or tightness of chest/throat. Medication for the treatment of reactions should be readily available. Infuse doxorubicin liposomal at 1 mg/minute initially to minimize risk of infusion reaction.

- Myocardial toxicity: **[U.S. Boxed Warning]: Doxorubicin may cause cumulative, dose-related myocardial toxicity (concurrent or delayed).** Doxorubicin liposomal should be used cautiously in patients with high cumulative doses of anthracyclines. Total cumulative dose should take into account previous or concomitant treatment with cardiotoxic agents or irradiation of chest. The incidence of irreversible myocardial toxicity increases as the total cumulative (lifetime) dosages approach 450-550 mg/m^2. Although the risk increases with cumulative dose, irreversible cardiotoxicity may occur with anthracycline treatment at any dose level. Patients with pre-existing heart disease, hypertension, concurrent administration of other antineoplastic agents, prior or concurrent chest irradiation, and advanced age are at increased risk. Evaluate left ventricular ejection fraction (LVEF) prior to treatment and periodically during treatment. The onset of symptoms of anthracycline-induced HF and/or cardiomyopathy may be delayed.

- Radiation therapy: Radiation recall reaction has been reported with doxorubicin liposomal treatment after radiation therapy. Radiation-induced toxicity (to the myocardium, mucosa, skin, and liver) may be increased by doxorubicin.

Disease-related concerns:

- Hepatic impairment: **[U.S. Boxed Warning]: Use with caution in patients with hepatic impairment;** dosage reduction is recommended. Safety and efficacy in hepatic dysfunction have not been established.

Concurrent drug therapy issues:

- Toxicity potentiation: Doxorubicin may potentiate the toxicity of cyclophosphamide (hemorrhagic cystitis) and mercaptopurine (hepatotoxicity).

Special populations:

- Pediatrics: Safety and efficacy in children have not been established.

Dosage form specific issues:

- Liposomal vs. conventional doxorubicin hydrochloride dosing: **[U.S. Boxed Warning]: Liposomal formulations of doxorubicin should NOT be substituted for conventional doxorubicin hydrochloride on a mg-per-mg basis.**

Pregnancy Risk FactorD
Pregnancy ConsiderationsMay cause fetal harm if administered during pregnancy. There are no adequate and well-controlled studies in pregnant women. Women of childbearing potential should avoid becoming pregnant during treatment.
LactationExcretion in breast milk unknown/contraindicated
Breast-Feeding ConsiderationsDue to the potential for serious adverse reactions in the nursing infant, breast-feeding is contraindicated.
Adverse Reactions

>10%:

Cardiovascular: Peripheral edema (≤11%)

Central nervous system: Fever (8% to 21%), headache (≤11%), pain (≤21%)

Dermatologic: Alopecia (9% to 19%); palmar-plantar erythrodysesthesia/hand-foot syndrome (≤51% in ovarian cancer, 3% in Kaposi's sarcoma), rash (≤29% in ovarian cancer, ≤5% in Kaposi's sarcoma)

Gastrointestinal: Stomatitis (5% to 41%), vomiting (8% to 33%), nausea (17% to 46%), mucositis (≤14%), constipation (≤30%), anorexia (≤20%), diarrhea (5% to 21%), dyspepsia (≤12%), intestinal obstruction (≤11%)

Hematologic: Myelosuppression (onset: 7 days; nadir: 10-14 days; recovery: 21-28 days), neutropenia (12% to 62%; grade 4: 4%), leukopenia (36%), thrombocytopenia (13% to 65%), anemia (6% to 74%; grade 4: <1%)

Neuromuscular & skeletal: Weakness (7% to 40%), back pain (≤12%)

Respiratory: Pharyngitis (≤16%), dyspnea (≤15%)

Miscellaneous: Infection (≤11%)

1% to 10%:

Cardiovascular: Cardiac arrest, chest pain, edema, hypotension, pallor, tachycardia, vasodilation

Central nervous system: Agitation, anxiety, chills, confusion, depression, dizziness, emotional lability, insomnia, somnolence, vertigo

Dermatologic: Acne, bruising, dry skin (6%), dermatitis (exfoliative and fungal), furunculosis, maculopapular rash, pruritus, skin discoloration, vesiculobullous rash

Endocrine & metabolic: Dehydration, hyperbilirubinemia, hypercalcemia, hyperglycemia, hypokalemia, hyponatremia

Gastrointestinal: Abdomen enlarged, anorexia, ascites, cachexia, dyspepsia, dysphagia, esophagitis, flatulence, gingivitis, glossitis, ileus, mouth ulceration, oral moniliasis, rectal bleeding, taste perversion, weight loss, xerostomia

Genitourinary: Cystitis, dysuria, leukorrhea, pelvic pain, polyuria, urinary incontinence, urinary tract infection, urinary urgency, vaginal bleeding, vaginal moniliasis

Hematologic: Hemolysis, prothrombin time increased

Hepatic: ALT increased

Local: Thrombophlebitis

Neuromuscular & skeletal: Arthralgia, hypertonia, myalgia, neuralgia, neuritis (peripheral), neuropathy, paresthesia (≤10%), pathological fracture

Ocular: Conjunctivitis, dry eyes, retinitis

Otic: Ear pain

Renal: Albuminuria, hematuria

Respiratory: Apnea, cough (≤10%), epistaxis, pleural effusion, pneumonia, rhinitis, sinusitis

Miscellaneous: Allergic reaction; infusion-related reactions (7%; includes bronchospasm, chest tightness, chills, dyspnea, facial edema, flushing, headache, herpes simplex/zoster, hypotension, pruritus); moniliasis, diaphoresis

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Abscess, acute brain syndrome, abnormal vision, acute myeloid leukemia (secondary), alkaline phosphatase increased, anaphylactic or anaphylactoid reaction, asthma, balanitis, blindness, bone pain, bronchitis, BUN increased, bundle branch block, cardiomegaly, cardiomyopathy, cellulitis, CHF, colitis, creatinine increased, cryptococcosis, diabetes mellitus, erythema multiforme, erythema nodosum, eosinophilia, fecal impaction, flu-like syndrome, gastritis, glucosuria, hemiplegia, hemorrhage, hepatic failure, hepatitis, hepatosplenomegaly, hyperkalemia, hypernatremia, hyperuricemia, hyperventilation, hypoglycemia, hypolipidemia, hypomagnesemia, hypophosphatemia, hypoproteinemia, hypothermia, injection site hemorrhage, injection site pain, jaundice, ketosis, lactic dehydrogenase increased, kidney failure, lymphadenopathy, lymphangitis, migraine, myositis, optic neuritis, palpitation, pancreatitis, pericardial effusion, petechia, pneumothorax, pulmonary embolism, radiation injury, sclerosing cholangitis, seizure, sepsis, skin necrosis, skin ulcer, syncope, tenesmus, thromboplastin decreased, thrombosis, tinnitus, urticaria, visual field defect, ventricular arrhythmia

Oncology: VesicantNo; may be an irritant

Oncology: Emetic PotentialLow (10% to 30%)

Metabolism/Transport Effects**Substrate** (major) of CYP2D6, 3A4; **Inhibits** CYP2B6 (moderate), 2D6 (weak), 3A4 (weak)

Drug Interactions

Bevacizumab: May enhance the cardiotoxic effect of Antineoplastic Agents (Anthracycline). *Risk C: Monitor therapy*

Cardiac Glycosides: Antineoplastic Agents may decrease the absorption of Cardiac Glycosides. This may only affect digoxin tablets. **Exceptions:** Digitoxin. *Risk C: Monitor therapy*

Cardiac Glycosides: May diminish the cardiotoxic effect of Antineoplastic Agents (Anthracycline). Antineoplastic Agents (Anthracycline) may decrease the serum concentration of Cardiac Glycosides. The effects of liposomal formulations may be unique from those of the free drug, as liposomal formulation have unique drug disposition and toxicity profiles, and liposomes themselves may alter digoxin absorption/distribution. *Risk C: Monitor therapy*

CYP2B6 Substrates: CYP2B6 Inhibitors (Moderate) may decrease the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Stavudine: DOXOrubicin (Liposomal) may diminish the therapeutic effect of Stavudine. *Risk D: Consider therapy modification*

Taxane Derivatives: May enhance the adverse/toxic effect of Antineoplastic Agents (Anthracycline). Taxane Derivatives may increase the serum concentration of Antineoplastic Agents (Anthracycline). Taxane Derivatives may also increase the formation of toxic anthracycline metabolites in heart tissue. *Risk D: Consider therapy modification*

Trastuzumab: May enhance the cardiotoxic effect of Antineoplastic Agents (Anthracycline). *Risk D: Consider therapy modification*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Zidovudine: DOXOrubicin (Liposomal) may enhance the adverse/toxic effect of Zidovudine. DOXOrubicin (Liposomal) may diminish the therapeutic effect of Zidovudine. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (due to GI irritation).

Herb/Nutraceutical: St John's wort may decrease doxorubicin levels.

Monitoring ParametersCBC with differential and platelet count, liver function tests (ALT/AST, bilirubin, alkaline phosphatase); monitor for infusion reactions

Cardiac function should be carefully monitored; echocardiography, left ventricular ejection fraction (LVEF), MUGA scan may be used during therapy. Endomyocardial biopsy is the most definitive test for anthracycline myocardial injury.

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents or herbal products patient may be taking (eg, potential to reduce or increase levels/effects of doxorubicin). See Administration infusion specifics. Premedication with antiemetic is recommended (especially with larger doses). Infusion site must be closely monitored; extravasation can cause sloughing or tissue necrosis. Patient must be monitored for infusion reactions (eg, flushing, dyspnea, fever, chills, tachycardia, hypotension, chest tightness, facial swelling, difficulty swallowing) during and following infusion; medication/equipment for treating reactions should be readily available. Assess results of laboratory tests and patient response prior to each treatment and on a regular basis throughout therapy. Teach patient possible side effects/appropriate interventions (eg, importance of adequate hydration) and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential, platelet count, echocardiogram, liver function tests (ALT/AST, bilirubin, alkaline phosphatase)

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy without consulting prescriber. This medication can only be administered by infusion. Report immediately any swelling, pain, burning, or redness at infusion site. Avoid alcohol (may cause gastrointestinal irritation). It is important to maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake, and adequate nutrition (small, frequent meals may help). You will be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). May cause nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); sore mouth or gums (use soft toothbrush); diarrhea (buttermilk, boiled milk, or yogurt may help); loss of hair (reversible); or red-pink urine (normal). Report immediately chest pain, swelling of extremities, respiratory difficulty, palpitations, or rapid heartbeat. Report unresolved nausea, vomiting, or diarrhea; alterations in urinary pattern (increased or decreased); opportunistic infection (fever, chills, unusual bruising or bleeding fatigue, purulent vaginal discharge, unhealed mouth sores); abdominal pain or blood in stools; excessive fatigue; redness, swelling, pain or blisters on palms of hands or soles of feet; or yellowing of eyes or skin. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication or for the first several months following therapy. Consult prescriber for appropriate contraceptives. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as hydrochloride: 2 mg/mL (10 mL, 25 mL)

Generic AvailableNo

Mechanism of ActionDoxorubicin inhibits DNA and RNA synthesis by intercalating between DNA base pairs causing steric obstruction and inhibits topoisomerase-II at the point of DNA cleavage. Doxorubicin is also a powerful iron chelator. The iron-doxorubicin complex can bind DNA and cell membranes, producing free hydroxyl (OH) radicals that cleave DNA and cell membranes. Active throughout entire cell cycle. Doxorubicin liposomal is a pegylated formulation which protects the liposomes, and thereby increases blood circulation time.

Pharmacodynamics/Kinetics

Distribution: V_{dss}: 2.7-2.8 L/m^2

Protein binding, plasma: Unknown; nonliposomal (conventional) doxorubicin: 70%

Half-life elimination: Terminal: Distribution: 4.7-5.2 hours, Elimination: 44-55 hours

Metabolism: Hepatic and in plasma to doxorubicinol and the sulfate and glucuronide conjugates of 4-demethyl,7-deoxyaglycones

Excretion: Urine (5% as doxorubicin or doxorubicinol)

Related Information

- Common Toxicity Criteria
- Management of Drug Extravasations
- Management of Nausea and Vomiting

Pharmacotherapy Pearls**Oncology Comment:** Pegylated liposomal doxorubicin is listed within National Comprehensive Cancer Network (NCCN) guidelines for the treatment of the following malignancies: Breast cancer (as a preferred single-agent therapy for recurrent or metastatic breast cancer), ovarian cancer (an acceptable second-line agent for recurrent ovarian cancer), and multiple myeloma, (as primary induction therapy for both transplant candidates and nontransplant candidates [in combination with vincristine and dexamethasone]).

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes

upon discontinuation), mucositis, gingivitis, glossitis, mouth ulceration, taste perversion, and stomatitis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentMyelosuppression is common; use caution with clozapine and carbamazepine

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

DOXOrubicin may be confused with DACTINomycin, DAUNOrubicin, DAUNOrubicin liposomal, doxacurium, doxapram, doxazosin, DOXOrubicin liposomal, epirubicin, IDArubicin

Adriamycin PFS® may be confused with achromycin, Aredia®, Idamycin®

Conventional formulation (Adriamycin PFS®, Adriamycin RDF®) may be confused with the liposomal formulation (Doxil®)

Use caution when selecting product for preparation and dispensing; indications, dosages and adverse event profiles differ between conventional DOXOrubicin hydrochloride solution and DOXOrubicin liposomal. Both formulations are the same concentration. As a result, serious errors have occurred.

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

ADR is an error-prone abbreviation

International issues:

Doxil® may be confused with Doxal® which is a brand name for doxepin in Finland, a brand name for doxycycline in Austria, and a brand name for pyridoxine/thiamine combination in Brazil

Rubex®: Brand name for ascorbic acid in Ireland

Pronunciation(doks oh ROO bi sin)

U.S. Brand NamesAdriamycin®; Rubex® [DSC]

Canadian Brand NamesAdriamycin®

Pharmacologic CategoryAntineoplastic Agent, Anthracycline

Use: Labeled IndicationsTreatment of leukemias, lymphomas, multiple myeloma, osseous and nonosseous sarcomas, mesotheliomas, germ cell tumors of the ovary or testis, and carcinomas of the head and neck, thyroid, lung, breast, stomach, pancreas, liver, ovary, bladder, prostate, uterus, neuroblastoma, and Wilms' tumor.

Dosing: AdultsRefer to individual protocols. **Note:** Lower dosage should be considered for patients with inadequate marrow reserve (due to old age, prior treatment or neoplastic marrow infiltration).

Usual or typical dosages: I.V.: 60-75 mg/m^2/dose every 21 days **or**

60 mg/m^2/dose every 2 weeks (dose dense) **or**

40-60 mg/m^2/dose every 3-4 weeks **or**

20-30 mg/m^2/day for 2-3 days every 4 weeks **or**

20 mg/m^2/dose once weekly

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to individual protocols. **Note:** Lower dosage should be considered for patients with inadequate marrow reserve (due to prior treatment or neoplastic marrow infiltration).

Usual/typical dosages: Children: I.V.:

35-75 mg/m^2/dose every 21 days **or**

20-30 mg/m^2/dose once weekly **or**

60-90 mg/m^2 given as a continuous infusion over 96 hours every 3-4 weeks

Dosing: Renal Impairment

Adjustments are not required.

Hemodialysis: Supplemental dose is not necessary.

Dosing: Hepatic Impairment

The FDA-approved labeling recommends the following adjustments:

- Serum bilirubin 1.2-3 mg/dL: Administer 50% of dose
- Serum bilirubin 3.1-5 mg/dL: Administer 25% of dose
- Severe hepatic impairment: Use is contraindicated

The following guidelines have been used by some clinicians: Floyd, 2006:

- ALT/AST 2-3 times ULN: Administer 75% of dose
- ALT/AST >3 times ULN or serum bilirubin 1.2-3 mg/dL: Administer 50% of dose
- Serum bilirubin 3.1-5 mg/dL: Administer 25% of dose
- Serum bilirubin >5 mg/dL: Do not administer

Dosing: Adjustment for ToxicityThe following delays and/or dose reductions have been used:

Neutropenic fever/infection: Consider reducing to 75% of dose in subsequent cycles

ANC <1000/mm^3: Delay treatment until ANC recovers to ≥1000/mm^3

Platelets <100,000/mm^3: Delay treatment until platelets recover to ≥100,000/mm^3

Dosing: Combination Regimens

Administration: I.V.Vesicant. I.V. push over at least 3-5 minutes or IVPB over 15-60 minutes. Infusion via central venous line recommended.
Administration: I.V. DetailMay be further diluted in either NS of D_5W for I.V. administration. Avoid extravasation associated with severe ulceration and soft tissue necrosis. Flush with 5-10 mL of I.V. solution before and after drug administration. Incompatible with heparin. Monitor for local erythematous streaking along vein and/or facial flushing (may indicate rapid infusion rate).

pH: 3.8-6.5 (lyophilized doxorubicin HCl reconstituted with sodium chloride 0.9%); 2.5-4.5 (adjusted solution)

StorageStore intact vials of solution under refrigeration at 2°C to 8°C and protected from light. Store intact vials of lyophilized powder at room temperature (15°C to 30°C). Reconstituted vials are stable for 7 days at room temperature (25°C) and 15 days under refrigeration (5°C) when protected from light. Infusions are stable for 48 hours at room temperature (25°C) when protected from light. Solutions diluted in 50-1000 mL D_5W or NS are stable for 48 hours at room temperature (25°C) when protected from light.
ReconstitutionReconstitute lyophilized powder with NS to a final concentration of 2 mg/mL (may further dilute in 50-1000 mL D_5W or NS for infusion). Unstable in solutions with a pH <3 or >7.
CompatibilityStable in D_5W, LR, NS.

Y-site administration: Compatible: Amifostine, aztreonam, bleomycin, chlorpromazine, cimetidine, cisplatin, cladribine, cyclophosphamide, dexamethasone sodium phosphate, diphenhydramine, droperidol, etoposide phosphate, famotidine, filgrastim, fludarabine, fluorouracil, gatifloxacin, gemcitabine, granisetron, hydromorphone, leucovorin, linezolid, lorazepam, melphalan, methotrexate, methylprednisolone sodium succinate, metoclopramide, mitomycin, morphine, ondansetron, paclitaxel, prochlorperazine edisylate, promethazine, ranitidine, sargramostim, sodium bicarbonate, teniposide, thiotepa, topotecan, vinblastine, vincristine, vinorelbine. **Incompatible:** Allopurinol, amphotericin B cholesteryl sulfate complex, cefepime, ganciclovir, piperacillin/tazobactam, propofol. **Variable (consult detailed reference):** Furosemide, heparin.

Compatibility in syringe: Compatible: Bleomycin, cisplatin, cyclophosphamide, droperidol, leucovorin, methotrexate, metoclopramide, mitomycin, vinblastine, vincristine. **Incompatible:** Furosemide, heparin. **Variable (consult detailed reference):** Fluorouracil.

Compatibility when admixed: Compatible: Dacarbazine, ondansetron, ondansetron with vincristine, paclitaxel, vinblastine. **Incompatible:** Aminophylline, diazepam, fluorouracil. **Variable (consult detailed reference):** Dacarbazine with ondansetron, etoposide with vincristine.

ContraindicationsHypersensitivity to doxorubicin, any component of the formulation, or to other anthracyclines or anthracenediones; recent MI, severe myocardial insufficiency, severe arrhythmia; previous therapy with high cumulative doses of doxorubicin, daunorubicin, idarubicin, or other anthracycline and anthracenediones; baseline neutrophil count <1500/mm^3; severe hepatic impairment

Warnings/Precautions

Boxed warnings:

- Bone marrow suppression: See "Concerns related to adverse effects" below.
- Experienced physician: See "Other warnings/precautions" below.
- Hepatic impairment: See "Disease-related concerns" below.
- Myocardial toxicity: See "Concerns related to adverse effects" below.
- Secondary malignancy: See "Concerns related to adverse effects" below.
- Skin irritation/extravasation: See "Concerns related to adverse effects" below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: **[U.S. Boxed Warning]: May cause severe myelosuppression;** dose-limiting, primarily leukopenia and neutropenia.
- Myocardial toxicity: **[U.S. Boxed Warning]: May cause cumulative, dose-related, myocardial toxicity (early or delayed).** Cardiotoxicity is dose-limiting. Total cumulative dose should take into account previous or concomitant treatment with cardiotoxic agents or irradiation of chest. The incidence of irreversible myocardial toxicity increases as the total cumulative (lifetime) dosages approach 450-500 mg/m^2. Although the risk increases with cumulative dose, irreversible cardiotoxicity may occur at any dose level. Patients with pre-existing heart disease, hypertension, concurrent administration of other antineoplastic agents, prior or concurrent chest irradiation, advanced age; and infants and children are at increased risk. Alternative administration schedules (weekly or continuous infusions) are associated with less cardiotoxicity. Baseline and periodic monitoring of ECG and LVEF (with either ECHO or MUGA scan) is recommended. Children are at increased for developing delayed cardiotoxicity.
- Secondary malignancy: **[U.S. Boxed Warnings]: Secondary acute myelogenous leukemia and myelodysplastic syndrome have been reported following treatment.**
- Skin irritation/extravasation: **[U.S. Boxed Warning]: I.V. administration only. Potent vesicant; if extravasation occurs, severe local tissue damage leading to ulceration and necrosis, and pain may occur.**
- Tumor lysis syndrome: May cause tumor lysis syndrome and hyperuricemia (in patients with rapidly growing tumors).

Disease-related concerns:

- Hepatic impairment: **[U.S. Boxed Warning]: Use with caution in patients with hepatic impairment;** toxicities may be increased in patients with hepatic impairment; dosage adjustment recommended. Use with caution in patients with hepatobiliary dysfunction.

Special populations:

- Pediatrics: Children are at increased risk for developing delayed cardiotoxicity; follow-up cardiac function monitoring is recommended. Doxorubicin may contribute to prepubertal growth failure in children; may also contribute to gonadal impairment (usually temporary). Radiation recall pneumonitis has been reported in children receiving concomitant dactinomycin and doxorubicin.
- Radiation recipients: Use with caution in patients who have received radiation therapy; reduce dosage in patients who are receiving radiation therapy simultaneously.

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician.**
- Vaccines: Administration of live vaccines to immunosuppressed patients may be hazardous.

Pregnancy Risk FactorD

Pregnancy ConsiderationsTeratogenicity and embryotoxicity were observed in animal studies. There are no adequate and well-controlled studies in pregnant women. Advise patients to avoid becoming pregnant (females) and to avoid causing pregnancy (males) during treatment. According to the National Comprehensive Cancer Network (NCCN) breast cancer guidelines, doxorubicin, if indicated, may be administered to pregnant women with breast cancer as part of a combination chemotherapy regimen, although chemotherapy should not be administered during the first trimester or after 35 weeks gestation.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsDoxorubicin and its metabolites are found in breast milk. Due to the potential for serious adverse reactions in the nursing infant, breast-feeding should be discontinued during treatment.

Adverse ReactionsFrequency not defined.

Cardiovascular:

Acute cardiotoxicity: Atrioventricular block, bradycardia, bundle branch block, ECG abnormalities, extrasystoles (atrial or ventricular), sinus tachycardia, ST-T wave changes, supraventricular tachycardia, tachyarrhythmia, ventricular tachycardia

Delayed cardiotoxicity: LVEF decreased, CHF (manifestations include ascites, cardiomegaly, dyspnea, edema, gallop rhythm, hepatomegaly, oliguria, pleural effusion, pulmonary edema, tachycardia); myocarditis, pericarditis

Central nervous system: Malaise

Dermatologic: Alopecia, itching, photosensitivity, radiation recall, rash; discoloration of saliva, sweat, or tears

Endocrine & metabolic: Amenorrhea, dehydration, infertility (may be temporary), hyperuricemia

Gastrointestinal: Abdominal pain, anorexia, colon necrosis, diarrhea, GI ulceration, mucositis, nausea, vomiting

Genitourinary: Discoloration of urine

Hematologic: Leukopenia/neutropenia (75%; nadir: 10-14 days; recovery: by day 21); thrombocytopenia and anemia

Local: Skin “flare” at injection site, urticaria

Neuromuscular & skeletal: Weakness

Postmarketing and/or case reports: Anaphylaxis, azoospermia, bilirubin increased, chills, coma (when in combination with cisplatin or vincristine), conjunctivitis, fever, gonadal impairment (children), growth failure (prepubertal), hepatitis, hyperpigmentation (nail, skin & oral mucosa), infection, keratitis, lacrimation, myelodysplastic syndrome, neutropenic fever, oligospermia, onycholysis, peripheral neurotoxicity (with intra-arterial doxorubicin), phlebosclerosis, radiation recall pneumonitis (children), secondary acute myelogenous leukemia, seizure (when in combination with cisplatin or vincristine), sepsis, shock, systemic hypersensitivity (including urticaria, pruritus, angioedema, dysphagia, and dyspnea), transaminases increased, urticaria

Oncology: VesicantYes; see Management of Drug Extravasations.

Oncology: Emetic PotentialModerate (30% to 60%)

Metabolism/Transport Effects**Substrate** (major) of CYP2D6, 3A4; **Inhibits** CYP2B6 (moderate), 2D6 (weak), 3A4 (weak)

Drug Interactions

Bevacizumab: May enhance the cardiotoxic effect of Antineoplastic Agents (Anthracycline). *Risk C: Monitor therapy*

Cardiac Glycosides: Antineoplastic Agents may decrease the absorption of Cardiac Glycosides. This may only affect digoxin tablets. **Exceptions:** Digitoxin. *Risk C: Monitor therapy*

Cardiac Glycosides: May diminish the cardiotoxic effect of Antineoplastic Agents (Anthracycline). Antineoplastic Agents (Anthracycline) may decrease the serum concentration of Cardiac Glycosides. The effects of liposomal formulations may be unique from those of the free drug, as liposomal formulation have unique drug disposition and toxicity profiles, and liposomes themselves may alter digoxin absorption/distribution. *Risk C: Monitor therapy*

CycloSPORINE: May decrease the metabolism of DOXOrubicin. *Risk D: Consider therapy modification*

CYP2B6 Substrates: CYP2B6 Inhibitors (Moderate) may decrease the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dabigatran Etexilate: P-Glycoprotein Inducers may decrease the serum concentration of Dabigatran Etexilate. *Risk C: Monitor therapy*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inducers may decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Sorafenib: May increase the serum concentration of DOXOrubicin. *Risk C: Monitor therapy*

Stavudine: DOXOrubicin may diminish the therapeutic effect of Stavudine. *Risk D: Consider therapy modification*

Taxane Derivatives: May decrease the metabolism of DOXOrubicin. **Exceptions:** Docetaxel. *Risk D: Consider therapy modification*

Taxane Derivatives: May enhance the adverse/toxic effect of Antineoplastic Agents (Anthracycline). Taxane Derivatives may increase the serum concentration of Antineoplastic Agents (Anthracycline). Taxane Derivatives may also increase the formation of toxic anthracycline metabolites in heart tissue. *Risk D: Consider therapy modification*

Trastuzumab: May enhance the cardiotoxic effect of Antineoplastic Agents (Anthracycline). *Risk D: Consider therapy modification*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Vitamin K Antagonists (eg, warfarin): Antineoplastic Agents may enhance the anticoagulant effect of Vitamin K Antagonists. Antineoplastic Agents may diminish the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Zidovudine: DOXOrubicin may enhance the adverse/toxic effect of Zidovudine. DOXOrubicin may diminish the therapeutic effect of Zidovudine. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid St John's wort (may decrease doxorubicin levels). Avoid black cohosh, dong quai in estrogen-dependent tumors.

Monitoring ParametersCBC with differential and platelet count; liver function tests (bilirubin, ALT/AST, alkaline phosphatase); serum uric acid, calcium, potassium, phosphate and creatinine; cardiac function (baseline, periodic, and followup): ECG, left ventricular ejection fraction (echocardiography [ECHO] or multigated radionuclide angiography [MUGA])

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents or herbal products patient may be taking (eg, potential to reduce or increase levels/effects of doxorubicin). See Administration infusion specifics. Premedication with antiemetic is recommended (especially with larger doses). Infusion site must be closely monitored; extravasation can cause sloughing or tissue necrosis (do not apply heat or sodium bicarbonate). Assess results of laboratory tests and patient response prior to each treatment and on a regular basis throughout therapy. Teach patient possible side effects/appropriate interventions (eg, importance of adequate hydration) and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential and platelet count; liver function tests (bilirubin, ALT/AST, alkaline phosphatase); serum uric acid, calcium, potassium, phosphate and creatinine; cardiac function (baseline, periodic, and followup): ECG, left ventricular ejection fraction (echocardiography [ECHO] or multigated radionuclide angiography [MUGA])

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This medication can only be administered intravenously. Report immediately any swelling, pain, burning, or redness at infusion site. Maintain adequate nutrition (small, frequent meals may help). You will be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). May cause nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); diarrhea (buttermilk, boiled milk, or yogurt may help); loss of hair (reversible); or darker yellow urine (normal). Report immediately chest pain, swelling of extremities, respiratory difficulty, palpitations, or rapid heartbeat. Report unresolved nausea, vomiting, or diarrhea; alterations in urinary pattern (increased or decreased); opportunistic infection (fever, chills, unusual bruising or bleeding fatigue, purulent vaginal discharge, unhealed mouth sores); abdominal pain or blood in stools; excessive fatigue; or yellowing of eyes or skin. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant while taking this medication or for 1 month following therapy. Consult prescriber for appropriate barrier contraceptives. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution, as hydrochloride: 10 mg, 50 mg

Adriamycin®: 10 mg, 20 mg, 50 mg, [contains lactose]

Rubex®: 50 mg, 100 mg [contains lactose] [DSC]

Injection, solution, as hydrochloride: 2 mg/mL (5 mL, 10 mL, 25 mL, 100 mL)

Adriamycin®: 2 mg/mL (5 mL, 10 mL, 25 mL, 100 mL)

Generic AvailableYes

Mechanism of ActionInhibition of DNA and RNA synthesis by intercalation between DNA base pairs by inhibition of topoisomerase II and by steric obstruction. Doxorubicin intercalates at points of local uncoiling of the double helix. Although the exact mechanism is unclear, it appears that direct binding to DNA (intercalation) and inhibition of DNA repair (topoisomerase II inhibition) result in blockade of DNA and RNA synthesis and fragmentation of DNA. Doxorubicin is also a powerful iron chelator; the iron-doxorubicin complex can bind DNA and cell membranes and produce free radicals that immediately cleave the DNA and cell membranes.

Pharmacodynamics/Kinetics

Absorption: Oral: Poor (<50%)

Distribution: V_d: 809-1214 L/m^2; to many body tissues, particularly liver, spleen, kidney, lung, heart; does not distribute into the CNS; crosses placenta

Protein binding, plasma: 70% to 76%

Metabolism: Primarily hepatic to doxorubicinol (active), then to inactive aglycones, conjugated sulfates, and glucuronides

Half-life elimination:

Distribution: 5-10 minutes

Elimination: Doxorubicin: 1-3 hours; Metabolites: 3-3.5 hours

Terminal: 17-48 hours

Male: 54 hours; Female: 35 hours

Excretion: Feces (~40% to 50% as unchanged drug); urine (~5% to 12% as unchanged drug and metabolites)

Clearance: Male: 113 L/hour; Female: 44 L/hour

Doxycycline Hyclate Periodontal Extended-Release Liquid

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(doks i SYE kleen HI klayt per ee oh DON tal ik STEN did ri LES LIK wid)
U.S. Brand NamesAtridox™
Canadian Brand NamesAtridox™
Pharmacologic Category[Antibiotic, Tetracycline Derivative]
Use: Labeled IndicationsUsed exclusively in dental applications
Use: DentalTreatment of chronic adult periodontitis for gain in clinical attachment, reduction in probing depth, and reduction in bleeding upon probing
Dosing: Adults

Periodontitis: Subgingival application: Dose depends on size, shape and number of pockets treated. Contains 50 mg doxycycline per 500 mg of formulation in each final blended syringe product. Application may be repeated four months after initial treatment.

Atridox™ subgingival controlled-release product: The delivery system consists of 2 separate syringes in a single pouch. Syringe A contains 450 mg of a bioabsorbable polymer gel; syringe B contains doxycycline hyclate 50 mg. To prepare for instillation, couple syringe A to syringe B. Inject contents of syringe A (purple stripe) into syringe B, then push contents back into syringe A. Repeat this mixing cycle at a rate of one cycle per second for 100 cycles. If syringes are stored prior to use (a maximum of 3 days), repeat mixing cycle 10 times before use. After appropriate mixing, contents should be in syringe A. Holding syringes vertically, with syringe A at the bottom, pull back on the syringe A plunger, allowing contents to flow down barrel for several seconds. Uncouple syringes and attach enclosed blunt cannula to syringe A. Local anesthesia is not required for placement. Cannula tip may be bent to resemble periodontal probe and used to explore pocket. Express product from syringe until pocket is filled. To separate tip from formulation, turn tip towards the tooth and press against tooth surface to achieve separation. An appropriate dental instrument may be used to pack gel into the pocket. Pockets may be covered with either Coe-Pak™ or Octyldent™ dental adhesive.

Dosing: ElderlyRefer to adult dosing.
Administration: OralAtridox™ subgingival controlled-release product: The delivery system consists of 2 separate syringes in a single pouch. Syringe A contains 450 mg of a bioabsorbable polymer gel; syringe B contains doxycycline hyclate 50 mg. To prepare for instillation, couple syringe A to syringe B. Inject contents of syringe A (purple stripe) into syringe B, then push contents back into syringe A. Repeat this mixing cycle at a rate of one cycle per second for 100 cycles. If syringes are stored prior to use (a maximum of 3 days), repeat mixing cycle 10 times before use. After appropriate mixing, contents should be in syringe A. Holding syringes vertically, with syringe A at the bottom, pull back on the syringe A plunger, allowing contents to flow down barrel for several seconds. Uncouple syringes and attach enclosed blunt cannula to syringe A. Local anesthesia is not required for placement. Cannula tip may be bent to resemble periodontal probe and used to explore pocket. Express product from syringe until pocket is filled. To separate tip from formulation, turn tip towards the tooth and press against tooth surface to achieve separation. An appropriate dental instrument may be used to pack gel into the pocket. Pockets may be covered with either Coe-Pak™ or Octyldent™ dental adhesive.
Dietary ConsiderationsMay be taken with food, milk, or water.
StorageDental gel: Store at 2°C to 8°C (36°F to 46°F). After mixing, coupled syringes may be stored for a maximum of 3 days at room temperature.
ContraindicationsHypersensitivity to doxycycline, tetracycline or any component of the formulation; children <8 years of age; severe hepatic dysfunction; pregnancy
Allergy Considerations

- Tetracycline Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Photosensitivity: May cause photosensitivity; discontinue if skin erythema occurs. Use skin protection and avoid prolonged exposure to sunlight; do not use tanning equipment.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Special populations:

- Pediatrics: May cause tissue hyperpigmentation, enamel hypoplasia, or permanent tooth discoloration; use of tetracyclines should be avoided during tooth development (children ≤8 years of age) unless other drugs are not likely to be effective or are contraindicated. However, recommended in treatment of anthrax exposure.

- Pregnancy: Do not use during pregnancy. In addition to affecting tooth development, tetracycline use has been associated with retardation of skeletal development and reduced bone growth.

Other warnings/precautions:

- Appropriate use: For subgingival application: This product has not been evaluated or tested in immunocompromised patients, in patients with oral candidiasis, or in conditions characterized by severe periodontal defects with little remaining periodontium. May result in overgrowth of nonsusceptible organisms, including fungi. Effects of treatment >6 months have not been evaluated. Has not been evaluated for use in regeneration of alveolar bone.

Pregnancy Risk FactorD

Adverse Reactions

>10%: Discoloration of teeth in children

<1%: Gastrointestinal: Nausea, diarrhea

Rare adverse effects of tetracyclines: Glossitis, vomiting, dysphagia, hepatotoxicity, esophageal ulceration (if capsule forms are taken before lying down), rash, anaphylaxis, exfoliative dermatitis, photosensitivity, exacerbations of SLE, hemolytic anemia, neutropenia and thrombocytopenia

Doxycycline periodontal gel (Atridox™): The adverse effects reported in clinical trials were similar in incidence between doxycycline-containing product and vehicle alone. In addition, these effects were comparable to standard therapies including scaling and root planing or oral hygiene. Events associated with application reported with an incidence >1% included: gum discomfort (18%), toothache (14%), periodontal abscess (10%), tooth sensitivity (8%), broken tooth (5%), tooth mobility (2%), endodontic abscess (2%) and jaw pain (1%). Systemic adverse events included headache (27%), muscle aches (7%), diarrhea (3%), upset stomach (4%), and nausea (2%). Although there is no known relationship between doxycycline and hypertension, unspecified essential hypertension was noted in 1.6% of the doxycycline gel group, as compared to 0.2% in the vehicle group. Allergic reactions to the vehicle were also reported in two patients.

Drug InteractionsThere are no known significant interactions.

Patient Education

Report persistent diarrhea.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Gel, subgingival: 50 mg in each 500 mg of blended formulation [2-syringe system includes doxycycline syringe (50 mg) and delivery system syringe (450 mg) with a blunt cannula]

Generic AvailableNo

Mechanism of ActionInhibits protein synthesis by binding with the 30S and possibly the 50S ribosomal subunit(s) of susceptible bacteria; may also cause alterations in the cytoplasmic membrane

Doxycycline inhibits collagenase *in vitro* and has been shown to inhibit collagenase in the gingival crevicular fluid in adults with periodontitis

Pharmacodynamics/KineticsSystemic absorption from dental subgingival gel may occur, but is limited by the slow rate of dissolution from this formulation over 7 days.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Discoloration of teeth (in children), gum discomfort, toothache, periodontal abscess, tooth sensitivity, broken tooth, tooth mobility, endodontic abscess, and jaw pain

Mechanical oral hygiene procedures (ie, tooth brushing, flossing) should be avoided in any treated area for 7 days.

Effects reported in clinical trials were similar in incidence between doxycycline-containing product and vehicle alone; comparable to standard therapies including scaling and root planing or oral hygiene. Although there is no known relationship between doxycycline and hypertension, unspecified essential hypertension was noted in 1.6% of the doxycycline gel group, as compared to 0.2% in the vehicle group (allergic reactions to the vehicle were also reported in two patients).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentMay cause photosensitivity and other dermatological reactions; consider this possibility when individuals are also taking psychotropics since this may produce similar reactions. Carbamazepine and barbiturates may decrease the effectiveness of doxycycline.

Pronunciation(doks i SYE kleen)
U.S. Brand NamesAdoxa®; Doryx®; Doxy-100®; Monodox®; Oracea™; Periostat®; Vibra-Tabs®; Vibramycin®
Canadian Brand NamesApo-Doxy Tabs®; Apo-Doxy®; Doxycin; Doxytec; Novo-Doxylin; Nu-Doxycycline; Periostat®; Vibra-Tabs®
Pharmacologic CategoryAntibiotic, Tetracycline Derivative
Use: Labeled IndicationsPrincipally in the treatment of infections caused by susceptible *Rickettsia*, *Chlamydia*, and *Mycoplasma*; alternative to mefloquine for malaria prophylaxis; treatment for syphilis, uncomplicated *Neisseria gonorrhoeae*, *Listeria*, *Actinomyces israelii*, and *Clostridium* infections in penicillin-allergic patients; used for community-acquired pneumonia and other common infections due to susceptible organisms; anthrax due to *Bacillus anthracis,* including inhalational anthrax (postexposure); treatment of infections caused by uncommon susceptible gram-negative and gram-positive organisms including *Borrelia recurrentis*, *Ureaplasma urealyticum*, *Haemophilus ducreyi*, *Yersinia pestis*, *Francisella tularensis*, *Vibrio cholerae*, *Campylobacter fetus*, *Brucella* spp, *Bartonella bacilliformis*, and *Calymmatobacterium granulomatis,* Q fever, Lyme disease; treatment of inflammatory lesions associated with rosacea; intestinal amebiasis; severe acne
Use: Unlabeled/InvestigationalSclerosing agent for pleural effusion injection; vancomycin-resistant enterococci (VRE)
Use: DentalTreatment of periodontitis associated with presence of *Actinobacillus actinomycetemcomitans* (AA); Atridox™ is indicated for the treatment of chronic adult periodontitis for gain in clinical attachment, reduction in probing depth, and reduction in bleeding on probing; Periostat® is indicated for use as an adjunct to scaling and root planing to promote attachment level gain and to reduce pocket depth in adult periodontitis (systemic levels are subinhibitory against bacteria)
Dosing: Adults

Usual dosage range: Oral, I.V.: 100-200 mg/day in 1-2 divided doses

Anthrax:

Inhalational (postexposure prophylaxis): Oral, I.V. (use oral route when possible): 100 mg every 12 hours for 60 days (*MMWR*, 2001, 50:889-93).

Cutaneous (treatment): Oral: 100 mg every 12 hours for 60 days. **Note:** In the presence of systemic involvement, extensive edema, lesions on head/neck, refer to I.V. dosing for treatment of inhalational/gastrointestinal/oropharyngeal anthrax

Inhalational/gastrointestinal/oropharyngeal (treatment): I.V.: Initial: 100 mg every 12 hours; switch to oral therapy when clinically appropriate; some recommend initial loading dose of 200 mg, followed by 100 mg every 8-12 hours (*JAMA*, 1997, 278:399-411).

Note: Initial treatment should include two or more agents predicted to be effective (per CDC recommendations). Agents suggested for use in conjunction with doxycycline or ciprofloxacin include rifampin, vancomycin, imipenem, penicillin, ampicillin, chloramphenicol, clindamycin, and clarithromycin. May switch to oral antimicrobial therapy when clinically appropriate. Continue combined therapy for 60 days.

Brucellosis: Oral: 100 mg twice daily for 6 weeks with rifampin or streptomycin

Chlamydial infections, uncomplicated: Oral: 100 mg twice daily for ≥7 days

Community-acquired pneumonia, bronchitis: Oral, I.V.: 100 mg twice daily

Endometritis, salpingitis, parametritis, or peritonitis: I.V.: 100 mg twice daily with cefoxitin 2 g every 6 hours for 4 days and for ≥48 hours after patient improves; then continue with oral therapy 100 mg twice daily to complete a 10- to 14-day course of therapy

Gonococcal infection, acute (PID) in combination with another antibiotic: I.V.: 100 mg every 12 hours until improved, followed by 100 mg orally twice daily to complete 14 days

Lyme disease, Q fever, or Tularemia: Oral: 100 mg twice daily for 14-21 days

Malaria prophylaxis: 100 mg/day. Start 1-2 days prior to travel to endemic area; continue daily during travel and for 4 weeks after leaving endemic area

Nongonococcal urethritis: Oral: 100 mg twice daily for 7 days

Periodontitis: Oral (Periostat®): 20 mg twice daily as an adjunct following scaling and root planing; may be administered for up to 9 months. Safety beyond 12 months of treatment and efficacy beyond 9 months of treatment have not been established.

Rickettsial disease or ehrlichiosis: Oral, I.V.: 100 mg twice daily for 7-14 days

Rosacea: (Oracea™): Oral: 40 mg once daily in the morning

Sclerosing agent for pleural effusion injection (unlabeled use): Irrigation: 500 mg as a single dose in 30-50 mL of NS or SWI

Syphilis:

Early syphilis: Oral, I.V.: 200 mg/day in divided doses for 14 days

Late syphilis: Oral, I.V.: 200 mg/day in divided doses for 28 days

***Yersinia pestis*(plague):** Oral: 100 mg twice daily for 7 days

Vibrio cholerae: Oral: 300 mg as a single dose

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Usual dosage range:

Children >8 years (<45 kg): Oral, I.V.: 2-5 mg/kg/day in 1-2 divided doses, not to exceed 200 mg/day

Children >8 years (>45 kg): Oral, I.V.: Refer to adult dosing.

Anthrax:

Inhalational (postexposure prophylaxis) (*MMWR*, 2001, 50:889-93): Oral, I.V. (use oral route when possible):

≤8 years: 2.2 mg/kg every 12 hours for 60 days

>8 years and ≤45 kg: 2.2 mg/kg every 12 hours for 60 days

>8 years and >45 kg: 100 mg every 12 hours for 60 days

Cutaneous (treatment): Oral: See dosing for "Inhalational (postexposure prophylaxis)"

Note: In the presence of systemic involvement, extensive edema, and/or lesions on head/neck, doxycycline should initially be administered I.V.

Inhalational/gastrointestinal/oropharyngeal (treatment): I.V.: Refer to dosing for inhalational anthrax (postexposure prophylaxis); switch to oral therapy when clinically appropriate.

Note: Initial treatment should include two or more agents predicted to be effective (per CDC recommendations). Agents suggested for use in conjunction with doxycycline or ciprofloxacin include rifampin, vancomycin, imipenem, penicillin, ampicillin, chloramphenicol, clindamycin, and clarithromycin. May switch to oral antimicrobial therapy when clinically appropriate. Continue combined therapy for 60 days

Malaria prophylaxis: Children ≥8 years: 2 mg/kg/day (maximum 100 mg/day). Start 1-2 days prior to travel to endemic area; continue daily during travel and for 4 weeks after leaving endemic area

Chlamydial infections, uncomplicated: Children ≥8 years and >45 kg: Oral: 100 mg twice daily for ≥7 days

Lyme disease, Q fever, or tularemia: Children ≥8 years and >45 kg: Oral: 100 mg twice daily for 14-21 days

Rickettsial disease or ehrlichiosis: Children ≥8 years and >45 kg: Oral, I.V.: 100 mg twice daily for 7-14 days

Dosing: Renal ImpairmentNo adjustment necessary.

Not dialyzable; 0% to 5% by hemo- and peritoneal methods or by continuous arteriovenous or venovenous hemofiltration; supplemental dose is not necessary.

Administration: I.V.Infuse slowly, usually over 1-4 hours. Avoid extravasation.

Administration: I.V. DetailAvoid extravasation. Very irritating to vein; use central line if possible.

pH: 1.8-3.3 (reconstituted solution)

Administration: OralMay give with meals to decrease GI upset. Capsule and tablet: Administer with at least 8 ounces of water and have patient sit up for at least 30 minutes after taking to reduce the risk of esophageal irritation and ulceration.

Oracea™: Take on an empty stomach 1 hour before or 2 hours after meals.

Doryx®: May be administered by carefully breaking up the tablet and sprinkling tablet contents on a spoonful of cold applesauce. The delayed release pellets must not be crushed or damaged when breaking up tablet. Should be administered immediately after preparation and without chewing.

Dietary Considerations

Tetracyclines (in general): Take with food if gastric irritation occurs. While administration with food may decrease GI absorption of doxycycline by up to 20%, administration on an empty stomach is not recommended due to GI intolerance. Of currently available tetracyclines, doxycycline has the least affinity for calcium.

Oracea™: Take on an empty stomach 1 hour before or 2 hours after meals.

Doryx®: 75 mg, 100 mg, and 150 mg tablets contain sodium 4.5 mg, 6 mg, and 9 mg respectively.

Storage

Capsule, tablet: Store at controlled room temperature of 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Protect from light.

I.V. infusion: Protect from light. Stability varies based on solution.

ReconstitutionI.V. infusion: Following reconstitution with sterile water for injection, dilute to a final concentration of 0.1-1 mg/mL using a compatible solution.

CompatibilitySolutions for I.V. infusion are stable in NS, D_5W, Ringer's injection, LR, D_5LR.

Y-site administration: Compatible: Acyclovir, amifostine, amiodarone, aztreonam, bivalirudin, cisatracurium, cyclophosphamide, dexmedetomidine, diltiazem, docetaxel, etoposide, fenoldopam, filgrastim, fludarabine, gemcitabine, granisetron, hetastarch, hydromorphone, linezolid, magnesium sulfate, melphalan, meperidine, morphine, ondansetron, perphenazine, propofol, remifentanil, sargramostim, tacrolimus, teniposide, theophylline, thiotepa, vinorelbine. **Incompatible:** Allopurinol, heparin, pemetrexed, piperacillin/tazobactam. **Variable (consult detailed reference):** Meropenem.

Compatibility in syringe: Compatible: Doxapram.

Compatibility when admixed: Compatible: Ranitidine. **Variable (consult detailed reference):** Meropenem.

Extemporaneously PreparedIf liquid doxycycline is unavailable for the treatment of anthrax, emergency doses may be prepared for children using the tablets.

Crush one 100 mg tablet and grind into a fine powder. Mix with 4 teaspoons of food or drink (lowfat milk, chocolate milk, chocolate pudding, or apple juice). Appropriate dose may be taken from this mixture. Mixture may be stored for up to 24 hours. Dairy mixtures should be refrigerated; apple juice may be stored at room temperature.

U.S. Food and Drug Administration, Center for Drug Evaluation and Research, "How to Prepare Emergency Dosages of Doxycycline at Home for Infants and Children," April 25, 2003, viewable at http://www.fda.gov/cder/drug/infopage/penG_doxy/doxycyclinePeds.htm, last accessed May 8, 2003.

ContraindicationsHypersensitivity to doxycycline, tetracycline or any component of the formulation; children ≤8 years of age, except in treatment of anthrax (including inhalational anthrax postexposure prophylaxis)

Allergy Considerations

- Tetracycline Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Autoimmune syndromes: Have been reported.
- Hepatotoxicity: Rarely occurs; if symptomatic, conduct LFT and discontinue drug.
- Increased BUN: May be associated with increases in BUN secondary to antianabolic effects; use caution in patients with renal impairment.
- Photosensitivity: May cause photosensitivity; discontinue if skin erythema occurs. Use skin protection and avoid prolonged exposure to sunlight; do not use tanning equipment.
- Pseudotumor cerebri: Has been (rarely) reported with tetracycline use; usually resolves with discontinuation.
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Special populations:

- Pediatrics: May cause tissue hyperpigmentation, enamel hypoplasia, or permanent tooth discoloration; use of tetracyclines should be avoided during tooth development (children ≤8 years of age) unless other drugs are not likely to be effective or are contraindicated. However, recommended in treatment of anthrax exposure.
- Pregnancy: Do not use during pregnancy. In addition to affecting tooth development, tetracycline use has been associated with retardation of skeletal development and reduced bone growth.

Dosage form specific issues:

- Oracea™: Should not be used for the treatment or prophylaxis of bacterial infections, since the lower dose of drug per capsule may be subefficacious and promote resistance.
- Periostat®: Effectiveness has not been established in patients with coexistent oral candidiasis; use with caution in patients with a history or predisposition to oral candidiasis.
- Syrup: Contains sodium metabisulfite.

Geriatric ConsiderationsDose adjustment for renal function is not necessary.

Pregnancy Risk FactorD

Pregnancy ConsiderationsBecause use during pregnancy may cause fetal harm, doxycycline is classified as pregnancy category D. Exposure to tetracyclines during the second or third trimester may cause permanent discoloration of the teeth. Most reports do not show an increase risk for teratogenicity with the exception of a potential small increased risk for cleft palate or esophageal atresia/stenosis. When considering treatment for life-threatening infection and/or prolonged duration of therapy (such as in anthrax), the potential risk to the fetus must be balanced against the severity of the potential illness.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsTetracyclines, including doxycycline, are excreted in breast milk and therefore, breast-feeding is not recommended by the manufacturer.

Doxycycline is less bound to the calcium in maternal milk which may lead to increased absorption compared to other tetracyclines. Only minimal amounts of doxycycline are excreted in human milk and the relative amount of tooth staining has been reported to be lower when compared to other tetracycline analogs. Nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- Doxycycline in Pregnancy & Lactation

Adverse ReactionsFrequency not defined.

Cardiovascular: Intracranial hypertension, pericarditis

Dermatologic: Angioneurotic edema, exfoliative dermatitis (rare), photosensitivity, rash, skin hyperpigmentation, urticaria

Endocrine & metabolic: Brown/black discoloration of thyroid gland (no dysfunction reported), hypoglycemia

Gastrointestinal: Anorexia, diarrhea, dysphagia, enterocolitis, esophagitis (rare), esophageal ulcerations (rare), glossitis, inflammatory lesions in anogenital region, nausea, oral (mucosal) pigmentation, pseudomembranous colitis, tooth discoloration (children), vomiting

Hematologic: Eosinophilia, hemolytic anemia, neutropenia, thrombocytopenia

Hepatic: Hepatotoxicity (rare)

Renal: BUN increased (dose related)

Miscellaneous: Anaphylactoid purpura, anaphylaxis, bulging fontanels (infants), serum sickness, SLE exacerbation

Note: Adverse effects in clinical trials with Periostat® occurring at a frequency more than 1% greater than placebo included nausea, dyspepsia, joint pain, diarrhea, menstrual cramp, and pain.

Metabolism/Transport Effects**Inhibits** CYP3A4 (moderate)

Drug Interactions

Antacids: May decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Barbiturates: May decrease the serum concentration of Doxycycline. *Risk D: Consider therapy modification*

Bile Acid Sequestrants: May decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Bismuth: May decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Bismuth Subsalicylate: May decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

CarBAMazepine: May decrease the serum concentration of Doxycycline. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Eplerenone: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Eplerenone. Management: A lower starting dose of eplerenone (25 mg once daily) is recommended in patients with hypertension who are also taking drugs that are moderate inhibitors of CYP3A4. *Risk D: Consider therapy modification*

FentaNYL: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Iron Salts: May decrease the absorption of Tetracycline Derivatives. Only a concern with orally administered products. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk D: Consider therapy modification*

Magnesium Salts: May decrease the absorption of Tetracycline Derivatives. Only applicable to oral preparations of each agent. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents: Tetracycline Derivatives may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Penicillins: Tetracycline Derivatives may diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Phenytoin: May decrease the serum concentration of Doxycycline. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Quinapril: May decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Ranolazine: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Ranolazine. Management: Limit the ranolazine dose to a maximum of 500mg twice daily in patients concurrently receiving moderate CYP3A4 inhibitors (e.g., diltiazem, verapamil, erythromycin, etc.). *Risk D: Consider therapy modification*

Retinoic Acid Derivatives: Tetracycline Derivatives may enhance the adverse/toxic effect of Retinoic Acid Derivatives. The development of pseudotumor cerebri is of particular concern. **Exceptions:** Adapalene; Alitretinoin; Tretinoin (Topical). *Risk X: Avoid combination*

Salmeterol: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Tetracycline Derivatives may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Chronic ethanol ingestion may reduce the serum concentration of doxycycline.

Food: Doxycycline serum levels may be slightly decreased if taken with food or milk. Administration with iron or calcium may decrease doxycycline absorption. May decrease absorption of calcium, iron, magnesium, zinc, and amino acids.

Herb/Nutraceutical: St John's wort may decrease doxycycline levels. Avoid dong quai, St John's wort (may also cause photosensitization).

Test InteractionsFalse elevations of urine catecholamine levels; false-negative urine glucose using Clinistix®, Tes-Tape®

Monitoring ParametersPerform culture and sensitivity testing prior to initiating therapy. CBC, renal and liver function tests periodically with prolonged therapy.

Nursing: Physical Assessment/MonitoringAssess results of culture and sensitivity test and patient's allergy history prior to beginning therapy. Assess potential for interactions with other pharmacologic agents or herbal products patient may be taking. **IV:** Infusion site must be closely monitored; extravasation can be very irritating to veins (use of central line is preferable). Assess therapeutic effectiveness (according to purpose for use) and adverse response on a regular basis throughout therapy. Advise patients with diabetes about use of Clinistix® (may cause false-negative). Teach patient appropriate use/administration (oral), possible side effects, interventions to reduce side effects (eg, importance of adequate hydration, photosensitivity precautions), and adverse symptoms to report.

Monitoring: Lab TestsPerform culture and sensitivity testing prior to initiating therapy. CBC, renal and liver function tests periodically with prolonged therapy.

Patient EducationIf administered by infusion, report immediately any acute back pain, difficulty breathing or swallowing, chest tightness, pain, redness, or swelling at infusion site. **Oral:** Do not take any new medication during therapy unless approved by prescriber. Take entire prescription as directed, even if you are feeling better. Follow exact directions for administering the form of drug you are using (eg, tablet, capsules, liquid, or delayed release). Generally, the medication may be taken with food if gastric irritation occurs. Avoid alcohol and maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. If you have diabetes, drug may cause false test results with Clinistix® urine glucose monitoring; use of another form of glucose monitoring is recommended. You may be sensitive to sunlight (use sunblock, wear protective clothing and eyewear, or avoid exposure to direct sunlight). May cause nausea or vomiting (small frequent meals, frequent mouth care, or sucking lozenges may help) or diarrhea (buttermilk, boiled milk, or yogurt may help). Report skin rash or itching; easy bruising or bleeding; yellowing of skin or eyes; pale stool or dark urine; unhealed mouth sores; vaginal itching or discharge; persistent diarrhea; and fever, chills, or unusual cough. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant while taking this medication. Consult prescriber for appropriate barrier contraceptive measures. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Note: Strength expressed as base.

Capsule, as hyclate: 50 mg, 100 mg

Vibramycin®: 100 mg

Capsule, as monohydrate: 50 mg, 100 mg

Monodox®: 50 mg, 75 mg, 100 mg

Capsule, variable release:

Oracea™: 40 mg [30 mg (immediate-release) and 10 mg (delayed-release)]

Injection, powder for reconstitution, as hyclate: 100 mg

Doxy-100®: 100 mg

Powder for oral suspension, as monohydrate: 25 mg/5 mL (60 mL)

Vibramycin®: 25 mg/5 mL (60 mL) [raspberry flavor]

Syrup, as calcium:

Vibramycin®: 50 mg/5 mL (480 mL) [contains sodium metabisulfite; raspberry-apple flavor]

Tablet, as hyclate: 20 mg, 100 mg

Periostat®: 20 mg

Vibra-Tabs®: 100 mg

Tablet, as monohydrate: 50 mg, 75 mg, 100 mg, 150 mg

Adoxa®: 50 mg, 75 mg, 100 mg

Adoxa® Pak™ 1/75 [unit-dose pack]: 75 mg (31s)

Adoxa® Pak™ 1/100 [unit-dose pack]: 100 mg (31s)

Adoxa® Pak™ 1/150 [unit-dose pack]: 150 mg (30s)

Adoxa® Pak™ 2/100 [unit-dose pack]: 100 mg (60s)

Tablet, delayed-release coated pellets, as hyclate:

Doryx®: 75 mg [contains sodium 4.5 mg (0.196 mEq); 100 mg [contains sodium 6 mg (0.261 mEq)]; 150 mg [contains sodium 9 mg (0.392 mEq)]

Generic AvailableYes: Excludes capsule (variable release), syrup

Pricing: U.S. (www.drugstore.com)

20 mg (30): $31.99

100 mg (20): $13.99

Tablets (Periostat)

20 mg (100): $337.47

Tablets (Vibra-Tabs)

100 mg (20): $129.13

Mechanism of ActionInhibits protein synthesis by binding with the 30S and possibly the 50S ribosomal subunit(s) of susceptible bacteria; may also cause alterations in the cytoplasmic membrane

Periostat® capsules (proposed mechanism): Has been shown to inhibit collagenase activity *in vitro*. Also has been noted to reduce elevated collagenase activity in the gingival crevicular fluid of patients with periodontal disease. Systemic levels do not reach inhibitory concentrations against bacteria.

Pharmacodynamics/Kinetics

Absorption: Oral: Almost complete

Distribution: Widely into body tissues and fluids including synovial, pleural, prostatic, seminal fluids, and bronchial secretions; saliva, aqueous humor, and CSF penetration is poor

Protein binding: 90%

Metabolism: Not hepatic; partially inactivated in GI tract by chelate formation

Half-life elimination: 12-15 hours (usually increases to 22-24 hours with multiple doses); End-stage renal disease: 18-25 hours

Time to peak, serum: 1.5-4 hours

Excretion: Feces (30%); urine (23%)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Glossitis and tooth discoloration (children). Opportunistic “superinfection” with *Candida albicans*; tetracyclines are not recommended for use during pregnancy or in children ≤8 years of age since they have been reported to cause enamel hypoplasia and permanent teeth discoloration. The use of tetracyclines should only be used in these patients if other agents are contraindicated or alternative antimicrobials will not eradicate the organism.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusTetracyclines have been reported to cause memory disturbance, mood stabilizing and antidepressant effects

Mental Health: Effects on Psychiatric TreatmentMay cause neutropenia; use caution with clozapine and carbamazepine; barbiturates and carbamazepine increase the clearance of doxycycline

Index TermsDoxycycline Calcium; Doxycycline Hyclate; Doxycycline Monohydrate

Doxylamine and Pyridoxine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Doxylamine may be confused with doxycycline

Pronunciation(dox IL a meen & peer i DOX een)

Canadian Brand NamesDiclectin®

Pharmacologic CategoryHistamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation; Vitamin, Water Soluble

Use: Labeled IndicationsTreatment of pregnancy-associated nausea and vomiting

Dosing: AdultsNausea and vomiting associated with pregnancy: Oral: Two delayed release tablets (a total of doxylamine 20 mg and pyridoxine 20 mg) at bedtime. In severe cases or in cases with nausea/vomiting during the day, dosage may be increased by 1 tablet in the morning and/or afternoon.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNo dosage adjustment required.

Administration: OralMain dose should be taken at bedtime to provide relief in the early morning hours.

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to doxylamine, pyridoxine, or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease).
- Increased intraocular pressure/glaucoma: Use with caution in patients with increased intraocular pressure or angle-closure glaucoma.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Pregnancy Risk FactorA

Pregnancy ConsiderationsDoxylamine has been approved for use in pregnancy-associated nausea and vomiting.

LactationExcretion in breast milk unknown

Breast-Feeding ConsiderationsDoxylamine may be excreted in breast milk, potentially resulting in sedative effects in nursing infants. Approved use of the combination of doxylamine and pyridoxine is limited to the prenatal period.

Adverse ReactionsFrequency not defined.

Cardiovascular: Palpitation, tachycardia

Central nervous system: Disorientation, dizziness, drowsiness, headache, paradoxical CNS stimulation, vertigo

Gastrointestinal: Anorexia, constipation, diarrhea, dry mucous membranes, epigastric pain, xerostomia

Genitourinary: Dysuria, urinary retention

Ocular: Blurred vision, diplopia

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Altretamine: Pyridoxine may diminish the therapeutic effect of Altretamine. Specifically when altretamine is used in combination with Cisplatin the response duration may be diminished. *Risk D: Consider therapy modification*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Barbiturates: Pyridoxine may increase the metabolism of Barbiturates. Apparent in high pyridoxine doses (eg, 200 mg/day) *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Levodopa: Pyridoxine may diminish the therapeutic effect of Levodopa. *Risk D: Consider therapy modification*

Phenytoin: Pyridoxine may increase the metabolism of Phenytoin. This is most apparent in high pyridoxine doses (eg, 80 mg to 200 mg daily) *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Nursing: Physical Assessment/Monitoring See Contraindications, Warnings/Precautions, and Dosing for use cautions. Assess potential for interactions with other prescription, OTC medications, or herbal products patient may be using (see Drug Interactions). Assess therapeutic effectiveness and adverse reactions (see Adverse Reactions) on a regular basis throughout therapy. Teach patient possible side effects/appropriate interventions and adverse symptoms to report (see Patient Education). Note breast-feeding caution.

Patient Education Inform prescriber of all other prescriptions, OTC medications, or herbal products you are taking and any allergies you have. Take exactly as directed; do not take more than recommended. May cause drowsiness, headache, disorientation, or double vision (use caution when driving or engaged is tasks requiring alertness until response to drug is known); mouth sores, gastrointestinal upset, lack of appetite (small frequent meals, frequent mouth care, or sucking lozenges may help). Report rapid heart beat, palpitations; change in urinary pattern (urinary retention); unusual CNS changes; or other persistent adverse reactions.

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Tablet, delayed release:

Diclectin® [CAN]: Doxylamine 10 mg and pyridoxine 10 mg [not available in the U.S.]

ManufacturerDuchesnay (Canada)

Mechanism of Action Doxylamine competes with histamine for H_1-receptor sites on effector cells; blocks chemoreceptor trigger zone, diminishes vestibular stimulation, and depresses labyrinthine function through its central anticholinergic activity. Pyridoxine is a vitamin which may have modest antiemetic effects.

Pharmacodynamics/Kinetics

Absorption: Well absorbed

Distribution: V_d: 2.5 L/kg

Metabolism: Via multiple metabolic pathways including N-demethylation, oxidation, hydroxylation, N-acetylation to metabolites including nordoxylamine, dinordoxylamine

Half-life elimination: 10-12 hours

Excretion: Urine (primarily as metabolites)

Mental Health: Effects on Mental Status May cause drowsiness, dizziness, disorientation, and paradoxical excitement

Mental Health: Effects on Psychiatric Treatment Concomitant use with psychotropic agents (including valerian, St John's wort, and kava kava) will produce additive sedative and anticholinergic effects. Conversely, the effects of cholinergic agonist will be ameliorated.

Index Terms Doxylamine Succinate and Pyridoxine Hydrochloride; Pyridoxine and Doxylamine

Doxylamine may be confused with doxycycline

Pronunciation

(dox IL a meen)

U.S. Brand NamesAldex® AN; Good Sense Sleep Aid [OTC]; Unisom® SleepTabs® [OTC]
Canadian Brand NamesUnisom®-2
Pharmacologic CategoryHistamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation
Use: Labeled IndicationsTreatment of short-term insomnia
Dosing: AdultsInsomnia: Oral: One tablet 30 minutes before bedtime; once daily or as instructed by healthcare professional
Dosing: Renal ImpairmentNo dosage adjustment required.
StorageStore at 15°C to 30°C (59°F to 86°F).
ContraindicationsHypersensitivity to doxylamine or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Sleeplessness: If sleeplessness persists for >2 weeks, consult healthcare provider.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease).
- Increased intraocular pressure/glaucoma: Use with caution in patients with increased intraocular pressure or angle-closure glaucoma.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Respiratory disease: Use with caution in patients with asthma or other chronic breathing disorders.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Geriatric ConsiderationsBecause of its considerable anticholinergic and sedative properties, this medication is not recommended for use in the elderly.
Pregnancy Risk FactorB
Pregnancy ConsiderationsDoxylamine has been approved for used in pregnancy-associated nausea and vomiting.

Dronabinol

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Dronabinol may be confused with droperidol

Pronunciation(droe NAB i nol)
U.S. Brand NamesMarinol®
Canadian Brand NamesMarinol®
Pharmacologic CategoryAntiemetic; Appetite Stimulant
Use: Labeled IndicationsChemotherapy-associated nausea and vomiting refractory to other antiemetic(s); AIDS-related anorexia
Use: Unlabeled/InvestigationalCancer-related anorexia
Dosing: Adults

Antiemetic: Oral: 5 mg/m^2 1-3 hours before chemotherapy, then give 5 mg/m^2/dose every 2-4 hours after chemotherapy for a total of 4-6 doses/day; dose may be increased up to a maximum of 15 mg/m^2/dose if needed (dosage may be increased by 2.5 mg/m^2 increments).

Appetite stimulant (AIDS-related): Oral: Initial: 2.5 mg twice daily (before lunch and dinner); titrate up to a maximum of 20 mg/day.

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricAntiemetic: Oral: Refer to adult dosing.
Dosing: Hepatic ImpairmentUsual dose should be reduced in patients with severe liver failure.
Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics

Dietary ConsiderationsCapsules contain sesame oil.
StorageStore under refrigeration (or in a cool environment) between 8°C and 15°C (46°F and 59°F). Protect from freezing.
RestrictionsC-III
ContraindicationsHypersensitivity to dronabinol, cannabinoids, sesame oil, or any component of the formulation, or marijuana; should be avoided in patients with a history of schizophrenia
Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists (drug is psychoactive substance in marijuana). Tolerance, psychological and physical dependence may occur with prolonged use.
- Hepatic impairment: Use with caution in patients with hepatic impairment; reduce dosage with severe impairment.
- Psychiatric disorders: Use with caution in patients with mania, depression, or schizophrenia; careful psychiatric monitoring is recommended.
- Seizure disorder: Use with caution in patients with a history of seizure disorder; may lower seizure threshold.

Concurrent drug therapy issues:

- CNS depressants: Effects may be potentiated when used with other psychoactive drugs, sedatives and/or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may cause postural hypotension.
- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Withdrawal: May cause withdrawal symptoms upon abrupt discontinuation.

Geriatric ConsiderationsElderly patients may be more sensitive to the CNS effects and postural hypotensive effects of dronabinol. Titrate the dose slowly and monitor for adverse effects.

Pregnancy Risk FactorC
LactationEnters breast milk/contraindicated
Adverse ReactionsFrequency not always specified.

>1%:

Cardiovascular: Palpitations, tachycardia, vasodilation/facial flushing

Central nervous system: Euphoria (8% to 24%, dose related), abnormal thinking (3% to 10%), dizziness (3% to 10%), paranoia (3% to 10%), somnolence (3% to 10%), amnesia, anxiety, ataxia, confusion, depersonalization, hallucination

Gastrointestinal: Abdominal pain (3% to 10%), nausea (3% to 10%), vomiting (3% to 10%)

Neuromuscular & skeletal: Weakness

<1%, postmarketing, and/or case reports: Conjunctivitis, depression, diarrhea, fatigue, fecal incontinence, flushing, hypotension, myalgia, nightmares, seizure, speech difficulties, tinnitus, vision difficulties

Oncology: Emetic PotentialVery low (<10%)
Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Anticholinergic Agents: May enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Cocaine: May enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

Ritonavir: May increase the serum concentration of Dronabinol. *Risk C: Monitor therapy*

Sympathomimetics: Cannabinoids may enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Administration with high-lipid meals may increase absorption.

Herb/Nutraceutical: St John's wort may decrease dronabinol levels.

Test InteractionsDecreased FSH, LH, growth hormone, and testosterone
Monitoring ParametersCNS effects, heart rate, blood pressure, behavioral profile
Reference RangeAntinauseant effects: 5-10 ng/mL
Nursing: Physical Assessment/MonitoringUse caution in the presence of heart disease, hepatic disease, or seizure disorders. Assess potential for interactions with other pharmacological agents or herbal products patient may be taking. Assess effectiveness of therapy according to purpose for use. Monitor closely for adverse psychotic reactions; this drug is the psychoactive substance in marijuana. Teach patient appropriate use, possible side effects/appropriate interventions, and adverse symptoms to report.
Patient EducationDo not take any new medication during therapy unless approved by prescriber (especially barbiturates and benzodiazepines). Take exactly as directed; do not increase dose or take more often than prescribed. Avoid alcohol. May cause psychotic reaction, impaired coordination or judgment, faintness, dizziness, or drowsiness (do not drive or engage in activities that require alertness and coordination until response to drug is known); or clumsiness, unsteadiness, or muscular weakness (change position slowly and use caution when climbing stairs). Report excessive or persistent CNS changes (euphoria, anxiety, depression, memory lapse, bizarre thought patterns, excitability, inability to control thoughts or behavior, fainting); respiratory difficulties; rapid heartbeat; or other adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, soft gelatin: 2.5 mg, 5 mg, 10 mg

Marinol®: 2.5 mg, 5 mg, 10 mg [contains sesame oil]

Generic AvailableYes
ManufacturerRoxane Laboratories, Inc
Pricing: U.S. (www.drugstore.com)

Capsules (Dronabinol)

2.5 mg (60): $259.98

5 mg (60): $679.93

10 mg (60): $959.96

Capsules (Marinol)

2.5 mg (30): $200.01

10 mg (30): $723.16

Mechanism of ActionUnknown, may inhibit endorphins in the brain's emetic center, suppress prostaglandin synthesis, and/or inhibit medullary activity through an unspecified cortical action. Some pharmacologic effects appear to involve sympathimometic activity;

tachyphylaxis to some effect (eg, tachycardia) may occur, but appetite-stimulating effects do not appear to wane over time. Antiemetic activity may be due to effect on cannabinoid receptors (CB1) within the central nervous system.

Pharmacodynamics/Kinetics

Onset of action: Within 1 hour

Peak effect: 2-4 hours

Duration: 24 hours (appetite stimulation)

Absorption: Oral: 90% to 95%; 10% to 20% of dose gets into systemic circulation

Distribution: V_d: 10 L/kg; dronabinol is highly lipophilic and distributes to adipose tissue

Protein binding: 97% to 99%

Metabolism: Hepatic to at least 50 metabolites, some of which are active; 11-hydroxy-delta-9-tetrahydrocannabinol (11-OH-THC) is the major metabolite; extensive first-pass effect

Half-life elimination: Dronabinol: 25-36 hours (terminal); Dronabinol metabolites: 44-59 hours

Time to peak, serum: 0.5-4 hours

Excretion: Feces (50% as unconjugated metabolites, 5% as unchanged drug); urine (10% to 15% as acid metabolites and conjugates)

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation) and orthostatic hypotension

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status Drowsiness, anxiety, confusion, and mood changes are common; may cause depression or hallucinations

Mental Health: Effects on Psychiatric Treatment Concurrent use with barbiturates and benzodiazepines produce additive sedation

Index Terms Delta-9 THC; Delta-9-tetrahydro-cannabinol; Tetrahydrocannabinol; THC

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Droperidol may be confused with dronabinol

Inapsine® may be confused with Nebcin®

Pronunciation(droe PER i dole)

U.S. Brand NamesInapsine®

Canadian Brand NamesDroperidol Injection, USP

Pharmacologic CategoryAntiemetic; Antipsychotic Agent, Typical

Use: Labeled IndicationsAntiemetic in surgical and diagnostic procedures; preoperative medication in patients when other treatments are ineffective or inappropriate

Dosing: AdultsTitrate carefully to desired effect: Prevention of postoperative nausea and vomiting (PONV): I.M., I.V.: Initial: 0.625-2.5 mg; additional doses of 1.25 mg may be administered to achieve desired effect; administer additional doses with caution. Consensus guidelines recommend 0.625-1.25 mg I.V. administered after surgery (Gan, 2003).

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricTitrate carefully to desired effect: Children 2-12 years: Nausea and vomiting: I.M., I.V.: 0.05-0.06 mg/kg (maximum initial dose: 0.1 mg/kg); additional doses may be repeated to achieve effect; administer additional doses with caution

Administration: I.V.Administer I.M. or I.V.; according to the manufacturer, I.V. push administration should be slow (generally regarded as 2-5 minutes); however, many clinicians administer I.V. doses rapidly (over 30-60 seconds) in an effort to reduce the incidence of EPS. The effect, if any, of rapid administration on QT prolongation is unclear. For I.V. infusion, dilute in 50-100 mL NS or D_5W; ECG monitoring for 2-3 hours after administration is recommended regardless of rate of infusion.

Administration: I.V. DetailpH: 3.0-3.8

StorageDroperidol ampuls/vials should be stored at room temperature and protected from light. Solutions diluted in NS or D_5W are stable at room temperature for up to 7 days.

CompatibilityStable in D_5W, LR, NS.

Y-site administration: Compatible: Alatrofloxacin, amifostine, aztreonam, bleomycin, cisatracurium, cisplatin, cladribine, cyclophosphamide, cytarabine, docetaxel, doxorubicin, doxorubicin liposome, etoposide phosphate, famotidine, filgrastim, fluconazole, fludarabine, gatifloxacin, gemcitabine, granisetron, hydrocortisone sodium succinate, idarubicin, linezolid, melphalan, meperidine, metoclopramide, mitomycin, ondansetron, paclitaxel, potassium chloride, propofol, remifentanil, sargramostim, teniposide, thiotepa, vinblastine, vincristine, vinorelbine, vitamin B complex with C. **Incompatible:** Allopurinol, amphotericin B cholesteryl sulfate complex, cefepime, fluorouracil, foscarnet, furosemide, leucovorin, nafcillin, piperacillin/tazobactam. **Variable (consult detailed reference):** Heparin, methotrexate.

Compatibility in syringe: Compatible: Atropine, bleomycin, butorphanol, chlorpromazine, cimetidine, cisplatin, cyclophosphamide, dimenhydrinate, diphenhydramine, doxorubicin, fentanyl, glycopyrrolate, hydroxyzine, meperidine, metoclopramide, midazolam, mitomycin, morphine, nalbuphine, pentazocine, perphenazine, prochlorperazine edisylate, promazine, promethazine, scopolamine, vinblastine, vincristine. **Incompatible:** Fluorouracil, furosemide, heparin, leucovorin, methotrexate, ondansetron, pentobarbital.

ContraindicationsHypersensitivity to droperidol or any component of the formulation; known or suspected QT prolongation, including congenital long QT syndrome (prolonged QT_c is defined as >440 msec in males or >450 msec in females)

Allergy Considerations

- Butyrophenone Allergy

Warnings/Precautions

Boxed warnings:

- Altered cardiac conduction: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Altered cardiac conduction: **[U.S. Boxed Warning]: Cases of QT prolongation and torsade de pointes, including some fatal cases, have been reported.** Use extreme caution in patients with bradycardia (<50 bpm), cardiac disease, concurrent MAO inhibitor therapy, Class I and Class III antiarrhythmics or other drugs known to prolong QT interval, and electrolyte disturbances (hypokalemia or hypomagnesemia), including concomitant drugs which may alter electrolytes (diuretics).
- Anticholinergic effects: May cause anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention); use with caution in patients with decreased gastrointestinal motility, urinary retention, BPH, xerostomia, or visual problems. Relative to other neuroleptics, droperidol has a low potency of cholinergic blockade.

- Esophageal dysmotility/aspiration: Has been associated with antipsychotic use; use with caution in patients at risk of pneumonia (eg, Alzheimer's disease).

- Extrapyramidal symptoms (EPS): May cause extrapyramidal symptoms, including pseudoparkinsonism, acute dystonic reactions, akathisia, and tardive dyskinesia (risk of these reactions is high relative to other neuroleptics). Risk of dystonia (and possibly other EPS) may be greater with increased doses, use of conventional antipsychotics, males, and younger patients.

- Neuroleptic malignant syndrome (NMS): Use may be associated with neuroleptic malignant syndrome (NMS); monitor for mental status changes, fever, muscle rigidity and/or autonomic instability.

- Orthostatic hypotension: May cause orthostatic hypotension; use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).

- Pigmentary retinopathy: May be associated with pigmentary retinopathy.

- Sedation: May be sedating, use with caution in disorders where CNS depression is a feature; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Temperature regulation: Impaired core body temperature regulation may occur; caution with strenuous exercise, heat exposure, dehydration, and concomitant medication possessing anticholinergic effects.

Disease-related concerns:

- Glaucoma: Use with caution in patients with narrow-angle glaucoma; condition may be exacerbated by cholinergic blockade. Screening is recommended. Relative to other neuroleptics, droperidol has a low potency of cholinergic blockade.

- Hepatic impairment: Use with caution in patients with severe hepatic impairment.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis; condition may be exacerbated by cholinergic blockade. Relative to other neuroleptics, droperidol has a low potency of cholinergic blockade.

- Pheochromocytoma: Use with caution in patients with pheochromocytoma; severe hypertension and/or tachycardia may occur.

- Prolactin-dependent tumors: Use with caution in breast cancer or other prolactin-dependent tumors; may elevate prolactin levels.

- Renal impairment: Use with caution in patients with renal impairment.

- Seizures: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold.

Concurrent drug therapy issues:

- Antiemetic effects: May mask toxicity of other drugs or conditions (eg, intestinal obstruction, Reye's syndrome, brain tumor) due to antiemetic effects.

Special populations:

- Elderly: Use with caution in the elderly; reduce initial dose.

- Pediatrics: Safety and efficacy have not been established in children <2 years of age.

Dosage form specific issues:

- Benzyl alcohol: Injection contains benzyl alcohol which has been associated with "gasping syndrome" in neonates.

- Sulfites: Injection contains sulfites which may cause allergic reaction.

Geriatric ConsiderationsMany elderly patients receive antipsychotic medications for inappropriate nonpsychotic behavior although the use of droperidol is seldom used for this indication. Since elderly frequently have cardiac disease which may result in QT prolongation, evaluation should be made prior to considering use of this agent.
Pregnancy Risk FactorC
Pregnancy ConsiderationsCrosses the placenta
LactationExcretion in breast milk unknown
Adverse Reactions

>10%:

Cardiovascular: QT_c prolongation (dose dependent)

Central nervous system: Restlessness, anxiety, extrapyramidal symptoms, dystonic reactions, pseudoparkinsonian signs and symptoms, tardive dyskinesia, seizure, altered central temperature regulation, sedation, drowsiness

Endocrine & metabolic: Swelling of breasts

Gastrointestinal: Weight gain, constipation

1% to 10%:

Cardiovascular: Hypotension (especially orthostatic), tachycardia, abnormal T waves with prolonged ventricular repolarization, hypertension

Central nervous system: Hallucinations, persistent tardive dyskinesia, akathisia

Gastrointestinal: Nausea, vomiting

Genitourinary: Dysuria

<1%: Adynamic ileus, agranulocytosis, alopecia, amenorrhea, arrhythmia, blurred vision, cholestatic jaundice, contact dermatitis, galactorrhea, gynecomastia, heat stroke, hyperpigmentation, laryngospasm, leukopenia (usually with large doses for prolonged periods), neuroleptic malignant syndrome (NMS), obstructive jaundice, overflow incontinence, photosensitivity (rare), priapism, pruritus, rash, respiratory depression, retinal pigmentation, sexual dysfunction, tardive dystonia, torsade de pointes, urinary retention, ventricular tachycardia, visual acuity decreased (may be irreversible), xerostomia

Oncology: VesicantNo
Oncology: Emetic PotentialVery low (<10%)
Drug Interactions

Acetylcholinesterase Inhibitors (Central): May enhance the neurotoxic (central) effect of Antipsychotics. Severe extrapyramidal symptoms have occurred in some patients. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Amphetamines: Antipsychotics may diminish the stimulatory effect of Amphetamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Anti-Parkinson's Agents (Dopamine Agonist): Antipsychotics (Typical) may diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Lithium formulations: May enhance the neurotoxic effect of Antipsychotics. Lithium formulations may decrease the serum concentration of Antipsychotics. Specifically noted with chlorpromazine. *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

Tetrabenazine: May enhance the adverse/toxic effect of Antipsychotics. *Risk C: Monitor therapy*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Monitoring ParametersTo identify QT prolongation, a 12-lead ECG prior to use is recommended; continued ECG monitoring for 2-3 hours following administration is recommended. Vital signs; lipid profile, fasting blood glucose/Hgb A_{1c}, serum magnesium and potassium; BMI; mental status, abnormal involuntary movement scale (AIMS); observe for dystonias, extrapyramidal side effects, and temperature changes
Nursing: Physical Assessment/MonitoringAssess other medications the patient may be taking for effectiveness and interactions. Monitor vital signs; cardiac and respiratory status on a frequent basis and especially immediately following administration and for several hours afterward. Monitor for extrapyramidal symptoms for 24-48 hours after therapy. Teach and use safety precautions until the patient is stable. Teach adverse reactions to report.
Monitoring: Lab TestsTo identify QT prolongation, a 12-lead ECG prior to use is recommended; ECG monitoring for 2-3 hours following administration is recommended. Lipid profile, fasting blood glucose/Hgb A_{1c}, serum magnesium and potassium; BMI
Patient EducationThis drug may cause you to feel very sleepy; do not attempt to get up without assistance. May cause orthostatic hypotension (use caution when changing position from lying or sitting to standing). You may experience constipation, (increasing exercise, fluids, fruit/fiber may help). Immediately report any respiratory difficulty, confusion, loss of thought processes, or palpitations.
Pregnancy/breast-feeding precautions: Inform prescriber if you are pregnant. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]: 2.5 mg/mL (1 mL, 2 mL)

Inapsine®: 2.5 mg/mL (1 mL, 2 mL)

Generic AvailableYes
Mechanism of ActionDroperidol is a butyrophenone antipsychotic; antiemetic effect is a result of blockade of dopamine stimulation of the chemoreceptor trigger zone. Other effects include alpha-adrenergic blockade, peripheral vascular dilation, and reduction of the pressor effect of epinephrine resulting in hypotension and decreased peripheral vascular resistance; may also reduce pulmonary artery pressure
Pharmacodynamics/Kinetics

Onset of action: Peak effect: Parenteral: ~30 minutes

Duration: Parenteral: 2-4 hours, may extend to 12 hours

Absorption: I.M.: Rapid

Distribution: Crosses blood-brain barrier and placenta

V_d: Children: ~0.25-0.9 L/kg; Adults: ~2 L/kg

Protein binding: Extensive

Metabolism: Hepatic, to *p*-fluorophenylacetic acid, benzimidazolone, *p*-hydroxypiperidine

Half-life elimination: Adults: 2.3 hours

Excretion: Urine (75%, <1% as unchanged drug); feces (22%, 11% to 50% as unchanged drug)

Related Information

- Discontinuation of Psychotropic Drugs
- Teratogenic Risks of Psychotropic Medications

Pharmacotherapy PearlsDoes not possess analgesic effects; has little or no amnesic properties.

Dental Health: Effects on Dental TreatmentSee Warnings/Precautions. Key adverse event(s) related to dental treatment: Orthostatic hypotension

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsManufacturer's information states that droperidol may block vasopressor activity of epinephrine. This has not been observed during use of epinephrine as a vasoconstrictor in local anesthesia. Droperidol is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution.

Mental Health: Effects on Psychiatric TreatmentContraindicated with ziprasidone

Mental Health CommentPrimarily reserved as an agent in acute or intensive care setting for patients in whom rapid control of symptoms/behavior is needed.

In 2008, the FDA issued a warning regarding increased mortality risk with typical **and** atypical antipsychotic drugs when used in elderly patients with dementia-related psychosis.

Cardiovascular ConsiderationsWarnings concerning QT prolongation have altered recommendations concerning perioperative use and monitoring. Baseline 12-lead ECG screening is recommended, and continued ECG monitoring for 2-3 hours postadministration is advised. Use should be limited to patients in whom alternatives are unacceptable. May cause hypotension and reflex tachycardia. This is more pronounced when the drug is given intravenously. For these reasons, use with caution in patients with angina. Has been associated with cases of QT prolongation and deaths associated with torsade de pointes. These events have occurred at or even below the normal dosage range.

Anesthesia and Critical Care Concerns/Other ConsiderationsMay cause hypotension and reflex tachycardia; this is more pronounced when the drug is given intravenously. Warnings concerning QT prolongation have altered recommendations concerning perioperative use and monitoring. Baseline 12-lead ECG screening is recommended, and continued ECG monitoring for 2-3 hours postadministration is advised. Droperidol does not possess analgesic effects and has little or no amnesic properties.

Index TermsDehydrobenzperidol

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(droh SPYE re none & es tra DYE ole)

U.S. Brand NamesAngeliq®

Canadian Brand NamesAngeliq®

Pharmacologic CategoryEstrogen and Progestin Combination

Use: Labeled IndicationsTreatment of moderate-to-severe vasomotor symptoms associated with menopause; treatment of vulvar and vaginal atrophy associated with menopause

Dosing: Adults

Moderate-to-severe vasomotor symptoms associated with menopause: Oral: One tablet daily; re-evaluate patients at 3- and 6-month intervals to determine if treatment is still necessary.

Atrophic vaginitis in females with an intact uterus: Oral: One tablet daily; re-evaluate patients at 3- and 6-month intervals to determine if treatment is still necessary.

Note: The lowest dose of estrogen/progestin that will control symptoms should be used; medication should be discontinued as soon as possible.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentUse in contraindicated.

Dosing: Hepatic ImpairmentUse in contraindicated.

StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to drospirenone, estradiol, or any component of the formulation; undiagnosed abnormal vaginal bleeding; history of or current thrombophlebitis or venous thromboembolic disorders (including DVT, PE); active or recent (within 1 year) arterial thromboembolic disease (eg, stroke, MI); carcinoma of the breast; estrogen-dependent tumor; hepatic or renal dysfunction or disease; adrenal insufficiency; pregnancy

Warnings/Precautions

Boxed warnings:

- Cardiovascular disease: See “Disease-related concerns” below.
- Dementia: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Breast cancer: Estrogens may increase the risk of breast cancer. An increased risk of invasive breast cancer was observed in postmenopausal women using CEE in combination with MPA; a smaller increase in risk was seen with estrogen therapy alone in observational studies. An increase in abnormal mammograms has also been reported with estrogen and progestin therapy. Estrogen use may lead to severe hypercalcemia in patients with breast cancer and bone metastases; discontinue estrogen if hypercalcemia occurs.
- Dementia: **[U.S. Boxed Warning]: The risk of dementia may be increased in postmenopausal women;** increased incidence was observed in women ≥65 years of age taking CEE alone or in combination with MPA.
- Hyperkalemia: Drospirenone has antimineralocorticoid activity that may lead to hyperkalemia in patients with renal insufficiency, hepatic dysfunction, or adrenal insufficiency; use caution with medications that may increase serum potassium.
- Lipid effects: Estrogen compounds are generally associated with lipid effects such as increased HDL-cholesterol and decreased LDL-cholesterol. Triglycerides may also be increased; use with caution in patients with familial defects of lipoprotein metabolism.
- Endometrial carcinoma: Unopposed estrogens may increase the risk of endometrial carcinoma in postmenopausal women. Estrogens may exacerbate endometriosis. Malignant transformation of residual endometrial implants has been reported posthysterectomy with estrogen only therapy.
- Retinal vascular thrombosis: Estrogens may cause retinal vascular thrombosis; discontinue permanently if papilledema or retinal vascular lesions are observed on examination.

Disease-related concerns:

- Cardiovascular disease: **[U.S. Boxed Warning]: Estrogens with or without progestin should not be used to prevent coronary heart disease.** Use caution with cardiovascular disease or dysfunction. May increase the risks of hypertension, myocardial infarction (MI), stroke, pulmonary emboli (PE), and deep vein thrombosis; incidence of these effects was shown to be significantly increased in postmenopausal women using conjugated equine estrogens (CEE) in combination with medroxyprogesterone acetate (MPA). Nonfatal MI, PE, and thrombophlebitis have also been reported in males taking high doses of CEE (eg, for prostate cancer).

- Cholestatic jaundice: Use caution with history of cholestatic jaundice associated with past estrogen use or pregnancy.

- Diseases exacerbated by fluid retention: Use with caution in patients with diseases which may be exacerbated by fluid retention, including asthma, epilepsy, migraine, diabetes, or renal dysfunction.

- Gallbladder disease: Use with caution in patients with gallbladder disease.

- Hepatic hemangiomas: Use with caution in patients with hepatic hemangiomas.

- Hypocalcemia: Use with caution in patients with severe hypocalcemia.

- Porphyria: Use with caution in patients with porphyria.

- SLE: Use with caution in patients with SLE.

Special populations:

- Premenopausal women: Not for use prior to menopause.

- Surgical patients: Whenever possible, estrogens should be discontinued at least 4 weeks prior to and for 2 weeks following elective surgery associated with an increased risk of thromboembolism or during periods of prolonged immobilization.

Other warnings/precautions:

- Risks vs. benefits: Before prescribing estrogen therapy to postmenopausal women, the risks and benefits must be weighed for each patient. Women should be informed of these risks and benefits, as well as possible effects of progestin when added to estrogen therapy. Estrogens with or without progestin should be used for shortest duration possible consistent with treatment goals. Conduct periodic risk:benefit assessments.

- Vulvar and vaginal atrophy use: When used solely for the treatment of vulvar and vaginal atrophy, topical vaginal products should be considered.

Geriatric ConsiderationsBefore prescribing estrogen therapy to postmenopausal women, the risks and benefits must be weighed for each patient. Women should be informed of these risks and benefits, as well as possible side effects and the return of menstrual bleeding (when cycled with a progestin), and be involved in the decision to prescribe. A higher incidence of stroke and invasive breast cancer was observed in women >75 years in a WHI substudy. Oral therapy may be more convenient for vaginal atrophy and urinary incontinence.

Pregnancy ConsiderationsUse is contraindicated during pregnancy

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsFollowing administration of an oral contraceptive agent containing drospirenone, ~0.02% of the dose was detected in breast milk, resulting in a maximum of ~3 mcg/day drospirenone to the infant. Estrogens may decrease the quality and quantity of breast milk.

Adverse Reactions

>10%:

Endocrine & metabolic: Breast pain (19%)

Gastrointestinal: Abdominal pain (11%)

Respiratory: Upper respiratory tract infection (19%)

1% to 10%:

Cardiovascular: Peripheral edema (2%)

Central nervous system: Headache (10%), pain (8%)

Gastrointestinal: Abdomen enlarged (7%)

Genitourinary: Vaginal hemorrhage (9%), endometrial disorder (2%), leukorrhea (1%)

Neuromuscular & skeletal: Back pain (7%)

Respiratory: Flu-like syndrome (7%), sinusitis (5%)

Additional adverse effects reported with estrogens and/or progestins: Abdominal cramps, acne, abnormal uterine bleeding, aggravation of porphyria, amenorrhea, anaphylactoid reactions, anaphylaxis, antifactor Xa decreased, antithrombin III decreased, appetite changes, bloating, breast enlargement, breast tenderness, cerebral embolism, cerebral thrombosis, chloasma, cholestatic jaundice, cholecystitis, cholelithiasis, chorea, contact lens intolerance, corneal curvature steepening, cystitis-like syndrome, decreased carbohydrate tolerance, depression, dementia, dizziness, dysmenorrhea; factors VII, VIII, IX, X, XII, VII-X complex, and II-VII-X complex increased; endometrial hyperplasia, erythema multiforme, erythema nodosum, galactorrhea, hemorrhagic eruption, fatigue, fibrinogen increased, impaired glucose tolerance, HDL-cholesterol increased, hirsutism, hypertension, gallbladder disease, insomnia, LDL-cholesterol decreased, libido changes, melasma, migraine, mood disturbances, nausea, nervousness, optic neuritis, pancreatitis, platelet aggregability and platelet count increased, premenstrual-like syndrome, PT and PTT accelerated, pulmonary embolism, pyrexia, retinal thrombosis, scalp hair loss, somnolence, stroke, thrombophlebitis, thyroid-binding globulin increased, total thyroid hormone (T_4) increased, triglycerides increased, urticaria, uterine leiomyomata size increased, vaginal candidiasis, vomiting, weight gain/loss

Metabolism/Transport Effects

Drospirenone: **Substrate** of CYP3A4 (minor); **Inhibits** CYP1A2 (weak), 2C9 (weak), 2C19 (weak), 3A4 (weak)

Estradiol: **Substrate** of CYP1A2 (major), 2A6 (minor), 2B6 (minor), 2C9 (minor), 2C19 (minor), 2D6 (minor), 2E1 (minor), 3A4 (major); **Inhibits** CYP1A2 (weak), 2C8 (weak); **Induces** CYP3A4 (weak)

Drug Interactions

ACE Inhibitors: Potassium-Sparing Diuretics may enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Acitretin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk X: Avoid combination*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Aminoglutethimide: May increase the metabolism of Progestins. *Risk D: Consider therapy modification*

Ammonium Chloride: Potassium-Sparing Diuretics may enhance the adverse/toxic effect of Ammonium Chloride. Specifically the risk of systemic acidosis. *Risk D: Consider therapy modification*

Angiotensin II Receptor Blockers: May enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk C: Monitor therapy*

Aprepitant: May decrease the serum concentration of Contraceptive (Progestins). *Risk D: Consider therapy modification*

Barbiturates: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Benzodiazepines (metabolized by oxidation): Oral Contraceptive (Progestins) may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

CarBAMazepine: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Cardiac Glycosides: Potassium-Sparing Diuretics may diminish the therapeutic effect of Cardiac Glycosides. Specifically, the inotropic effects. *Risk C: Monitor therapy*

Corticosteroids (Systemic): Estrogen Derivatives may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CYP1A2 Inducers (Strong): May increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Eplerenone: May enhance the hyperkalemic effect of Potassium-Sparing Diuretics. Management: This combination is contraindicated in patients receiving eplerenone for treatment of hypertension. *Risk D: Consider therapy modification*

Felbamate: May decrease the serum concentration of Oral Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Fosaprepitant: May decrease the serum concentration of Contraceptive (Progestins). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Griseofulvin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk X: Avoid combination*

Herbs (Estrogenic Properties): May enhance the adverse/toxic effect of Estrogen Derivatives. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Progestogenic Properties) (eg, Bloodroot, Yucca): May enhance the adverse/toxic effect of Progestins. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Mitotane: Potassium-Sparing Diuretics may diminish the therapeutic effect of Mitotane. High dose diuretics (eg, Cushings syndrome) may present significantly higher risk than low doses (eg, CHF). *Risk D: Consider therapy modification*

Mycophenolate: May decrease the serum concentration of Oral Contraceptive (Progestins). *Risk D: Consider therapy modification*

OXcarbazepine: May decrease the serum concentration of Oral Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phenytoin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy*

modification

Potassium Salts: May enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk D: Consider therapy modification*

Potassium-Sparing Diuretics: Drospirenone may enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

QuiNIDine: Potassium-Sparing Diuretics may diminish the therapeutic effect of QuiNIDine. *Risk C: Monitor therapy*

Retinoic Acid Derivatives: May diminish the therapeutic effect of Oral Contraceptive (Progestins). Two forms of contraception are recommended in females of child-bearing potential during retinoic acid derivative therapy. **Exceptions:** Adapalene; Alitretinoin; Tretinoin (Topical). *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Ropinirole: Estrogen Derivatives may increase the serum concentration of Ropinirole. *Risk C: Monitor therapy*

Selegiline: Oral Contraceptive (Progestins) may increase the serum concentration of Selegiline. *Risk D: Consider therapy modification*

Somatropin: Estrogen Derivatives may diminish the therapeutic effect of Somatropin. Shown to be a concern with oral hormone replacement therapy in postmenopausal women. *Risk D: Consider therapy modification*

St Johns Wort: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Thyroid Products: Estrogen Derivatives may diminish the therapeutic effect of Thyroid Products. *Risk C: Monitor therapy*

Tipranavir: Estrogen Derivatives may enhance the dermatologic adverse effect of Tipranavir. The combination of tipranavir/ritonavir and ethinyl estradiol/norethindrone was associated with a high incidence of skin rash. Tipranavir may decrease the serum concentration of Estrogen Derivatives. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Contraceptive (Progestins) may diminish the anticoagulant effect of Vitamin K Antagonists. In contrast, enhanced anticoagulant effects have also been noted with some products. *Risk D: Consider therapy modification*

Voriconazole: May decrease the metabolism of Oral Contraceptive (Progestins). Oral Contraceptive (Progestins) may increase the serum concentration of Voriconazole. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (routine use increases estrogen level and risk of breast cancer). Ethanol may also increase the risk of osteoporosis.

Test InteractionsPathologist should be advised of estrogen/progesterone therapy when specimens are submitted. Reduced response to metyrapone test.

Monitoring ParametersYearly physical examination that includes blood pressure and Papanicolaou smear, breast exam, mammogram. Monitor for signs of endometrial cancer. Adequate diagnostic measures, including endometrial sampling, if indicated, should be performed to rule out malignancy in all cases of undiagnosed abnormal vaginal bleeding. Monitor for loss of vision, sudden onset of proptosis, diplopia, migraine; signs and symptoms of thromboembolic disorders; glycemic control in patients with diabetes; lipid profiles in patients being treated for hyperlipidemias; thyroid function in patients on thyroid hormone replacement therapy.

Menopausal symptoms: Assess need for therapy at 3- to 6-month intervals.

Nursing: Physical Assessment/MonitoringSee individual agent for Estradiol.

Monitoring: Lab TestsGlycemic control in patients with diabetes; lipid profiles in patients being treated for hyperlipidemias; thyroid function in patients on thyroid hormone replacement therapy

Patient EducationSee individual agent for Estradiol.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: Drospirenone 0.5 mg and estradiol 1 mg

Generic AvailableNo

ManufacturerBerlix, Inc

Pricing: U.S. (www.drugstore.com)

Tablets (Angeliq)

0.5-1 mg (28): $64.99

Mechanism of Action

Drospirenone is a synthetic progestin and spironolactone analog with antimineralocorticoid and antiandrogenic activity. Counteracts estrogen effects causing endometrial thinning.

Estrogens are responsible for the development and maintenance of the female reproductive system and secondary sexual characteristics. Estradiol is the principal intracellular human estrogen and is more potent than estrone and estriol at the receptor level; it is the primary estrogen secreted prior to menopause. Following menopause, estrone and estrone sulfate are more highly produced. Estrogens modulate the pituitary secretion of gonadotropins, luteinizing hormone, and follicle-stimulating hormone through a negative feedback system; estrogen replacement reduces elevated levels of these hormones in postmenopausal women.

Pharmacodynamics/Kinetics

Distribution: Drospirenone: 4.2 L/kg

Protein binding:

Drospirenone: 97%; does not bind to sex hormone binding globulin or corticosteroid binding globulin

Estradiol: 37% bound to sex hormone binding globulin; 61% bound to albumin

Metabolism: Hepatic

Drospirenone forms two metabolites (inactive)

Estradiol: Converted to estrone and estriol; also undergoes enterohepatic recirculation; estrone sulfite is the main metabolite in postmenopausal women

Bioavailability: Drospirenone: 76% to 85%

Time to peak, plasma: Drospirenone: 1 hour; Estradiol: 6-8 hours

Dental Health: Effects on Dental TreatmentWhen prescribing antibiotics, patient must be warned to use additional methods of birth control if on oral contraceptives.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause depression or other mood disturbances

Mental Health: Effects on Psychiatric TreatmentCombined use with carbamazepine, felbamate, phenobarbital, phenytoin, or topiramate may increase the metabolism of ethinyl estradiol and/or some progestins, leading to possible decrease in contraceptive effectiveness. Estrogens may elevate triglycerides; combined use with clozapine, olanzapine, or quetiapine may produce additive risks; monitor lipid profile.

Mental Health CommentThe role of hormone replacement therapy for postmenopausal women continues to evolve, given findings from a large-scale women's health initiative, which suggested a small but significant increased risk of dementia. Seizure frequency may also be increased in menopausal women with epilepsy.

Index TermsE2 and DRSP; Estradiol and Drospirenone

International Brand NamesAngeliq (CA)

Drotrecogin Alfa

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(dro TRE coe jin AL fa)

U.S. Brand NamesXigris®

Canadian Brand NamesXigris®

Pharmacologic CategoryProtein C (Activated)

Use: Labeled IndicationsReduction of mortality from severe sepsis (associated with organ dysfunction) in adults at high risk of death (eg, APACHE II score ≥25)

Use: Unlabeled/InvestigationalPurpura fulminans

Dosing: Adults

Purpura fulminans (unlabeled use): 24 mcg/kg/hour

Severe sepsis: I.V.: 24 mcg/kg/hour for a total of 96 hours; stop infusion **immediately** if clinically-important bleeding is identified. **Note:** Use actual body weight for dosing.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricPurpura fulminans (unlabeled use): Refer to adult dosing.

Dosing: Renal ImpairmentNo specific adjustment recommended.

Calculations

- Drotrecogin Alfa

Administration: I.V.Administer via infusion pump. Administration must be completed within 12 hours of solution preparation. Suspend administration for 2 hours prior to invasive procedures or other procedure with significant bleeding risk; may continue treatment immediately following uncomplicated, minimally-invasive procedures, but delay for 12 hours after major invasive procedures/surgery.

Administration: I.V. DetailCompatible with 0.9% sodium chloride; normal saline, dextrose, lactated Ringer's or dextrose/saline mixtures may be infused through the same infusion line. Compatible with ceftriaxone, cisatracurium, fluconazole, nitroglycerin, potassium chloride, and vasopressin.

StorageStore vials under refrigeration at 2°C to 8°C (36°F to 46°F). Protect from light. Do not freeze.

ReconstitutionReconstitute 5 mg vials with 2.5 mL and 20 mg vials with 10 mL sterile water for injection (resultant solution ~2 mg/mL). Must be further diluted (within 3 hours of reconstitution) in 0.9% sodium chloride, typically to a concentration between 100 mcg/mL and 200 mcg/mL when using infusion pump and between 100 mcg/mL and 1000 mcg/mL when infused via syringe pump. Although product information states administration must be completed within 12 hours of preparation, additional studies (data on file, Lilly Research Laboratories) show that the final solution is stable for 14 hours at 15°C to 30°C (59°F to 86°F). If not used immediately, a prepared solution may be stored in the refrigerator for up to 12 hours. The total expiration time (refrigeration and administration) should be ≤24 hours from time of preparation.

CompatibilityStable in NS; only NS, dextrose, LR, or dextrose/saline mixtures may be infused through the same line.

Y-site administration: Compatible: Ceftriaxone, cisatracurium, fluconazole, nitroglycerin, potassium chloride, vasopressin. **Incompatible:** Amiodarone, ampicillin/sulbactam sodium, ceftazidime, ciprofloxacin, clindamycin, cyclosporine, dobutamine hydrochloride, dopamine hydrochloride, epinephrine hydrochloride, fosphenytoin, furosemide, gentamicin sulfate, heparin sodium, human serum albumin, imipenem/cilastatin sodium, insulin human (regular), levofloxacin, magnesium sulfate, metronidazole, midazolam hydrochloride, nitroprusside sodium, norepinephrine bitartrate, piperacillin/tazobactam sodium, potassium phosphate, ranitidine hydrochloride, ticarcillin/clavulanate, tobramycin sulfate, vancomycin hydrochloride.

ContraindicationsHypersensitivity to drotrecogin alfa or any component of the formulation; active internal bleeding; recent hemorrhagic stroke (within 3 months); severe head trauma (within 2 months); recent intracranial or intraspinal surgery (within 2 months); intracranial neoplasm or mass lesion; evidence of cerebral herniation; presence of an epidural catheter; trauma with an increased risk of life-threatening bleeding

Warnings/Precautions

Concerns related to adverse effects:

- Bleeding: Increases risk of bleeding; careful evaluation of risks and benefit is required prior to initiation. Bleeding risk is increased in patients receiving concurrent therapeutic heparin, oral anticoagulants, glycoprotein IIb/IIIa antagonists, platelet aggregation inhibitors, or aspirin at a dosage of >650 mg/day (within 7 days). In addition, an increased bleeding risk is associated with prolonged INR (>3), gastrointestinal bleeding (within 6 weeks), decreased platelet count (<30,000/mm^3), thrombolytic therapy (within 3 days), recent ischemic stroke (within 3 months), intracranial AV malformation or aneurysm, known bleeding diathesis, severe hepatic disease (chronic), or other condition where bleeding is a significant hazard or difficult to manage due to its location. Discontinue if significant bleeding occurs (may consider continued use after stabilization). Suspend administration for 2 hours prior to invasive procedures or other procedure with significant bleeding risk; may continue treatment immediately following uncomplicated, minimally-invasive procedures, but delay for 12 hours after major invasive procedures/surgery. During treatment, aPTT cannot be used to assess coagulopathy (PT/INR not affected).

Disease-related concerns:

- Conditions excluded from clinical trial: Efficacy not established in adult patients at a low risk of death (APACHE II score <25). Patients with pre-existing nonsepsis-related medical conditions with a poor prognosis (anticipated survival <28 days), patients with acute pancreatitis (no established source of infection), HIV-infected patients with a CD4 count ≤50 cells/mm^3, chronic dialysis patients, pre-existing hypercoagulable conditions, and patients who had received bone marrow, liver, lung, pancreas, or small bowel transplants were excluded from the clinical trial which established benefit. In addition, patients weighing >135 kg were not evaluated.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy Risk FactorC

LactationExcretion in breast milk unknown/not recommended

Adverse ReactionsAs with all drugs which may affect hemostasis, bleeding is the major adverse effect associated with drotrecogin alfa. Hemorrhage may occur at virtually any site. Risk is dependent on multiple variables, including the dosage administered, concurrent use of multiple agents which alter hemostasis, and patient predisposition.

>10%:

Dermatologic: Bruising

Gastrointestinal: Gastrointestinal bleeding

1% to 10%: Hematologic: Bleeding (serious 2.4% during infusion vs 3.5% during 28-day study period; individual events listed as <1%)

<1%: Gastrointestinal hemorrhage, intrathoracic hemorrhage, retroperitoneal bleeding, genitourinary bleeding, intracranial hemorrhage (0.2%; frequencies up to 2% noted in a previous trial without placebo control), skin/soft tissue bleeding, immune reaction (antibody production)

Drug Interactions

Anticoagulants: May enhance the anticoagulant effect of other Anticoagulants. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Antithrombin III: May enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Danaparoid: May enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Dasatinib: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Fondaparinux: Drotrecogin Alfa may enhance the adverse/toxic effect of Fondaparinux. Bleeding may occur. *Risk D: Consider therapy modification*

Heparin: May enhance the adverse/toxic effect of Drotrecogin Alfa. This is of concern with therapeutic dosages of heparin. Bleeding may occur. *Risk D: Consider therapy modification*

Heparin (Low Molecular Weight): May enhance the adverse/toxic effect of Drotrecogin Alfa. This is of most concern with therapeutic doses of LMW heparin. Bleeding may occur. *Risk D: Consider therapy modification*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Anticoagulants. Bleeding may occur. *Risk D: Consider therapy modification*

Ibritumomab: Anticoagulants may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to an increased risk of bleeding. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the adverse/toxic effect of Anticoagulants. Specifically, the antiplatelet effects of these agents may lead to an increased risk of bleeding with the combination. *Risk C: Monitor therapy*

Salicylates: May enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Thrombolytic Agents: May enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Tositumomab and Iodine I 131 Tositumomab: Anticoagulants may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse effects may be increased. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): May enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Recent use/intake of herbs with anticoagulant or antiplatelet activity (including cat's claw, feverfew, garlic, ginkgo, ginseng, and horse chestnut seed) may increase the risk of bleeding.

Test InteractionsMay interfere with one-stage coagulation assays based on the aPTT (such as factor VIII, IX, and XI assays).

Monitoring ParametersMonitor for signs and symptoms of bleeding, hemoglobin/hematocrit, PT/INR, platelet count

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking (especially drugs affecting coagulation or platelet activity). Assess results of laboratory tests prior to, during, and following therapy. Patient must be monitored very closely for bleeding during and following infusion (hemorrhage may occur at virtually any site). If significant bleeding occurs, infusion should be stopped and prescriber notified immediately. Bleeding precautions must be observed. Patient instruction should be according to patient condition.

Monitoring: Lab TestsHemoglobin/hematocrit, PT/INR, platelet count

Patient EducationInform prescriber of all prescriptions, OTC medications, or herbal products you are taking, and any allergies you have. This medication can only be administered by infusion. You will be monitored closely. Report immediately any unusual or acute abdominal pain or headache, or respiratory difficulty. You will be more susceptible to bleeding and bruising; remain in bed and ring for assistance to avoid falling or injuring yourself. Avoid sharps of any kind (knives, scissors, needles, nail clippers, etc; shave with a safety razor). **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution [preservative free]: 5 mg [contains sucrose 31.8 mg], 20 mg [contains sucrose 124.9 mg]

Generic AvailableNo

ManufacturerEli Lilly and Co

Mechanism of ActionInhibits factors Va and VIIIa, limiting thrombotic effects. Additional *in vitro* data suggest inhibition of plasminogen activator inhibitor-1 (PAF-1) resulting in profibrinolytic activity, inhibition of macrophage production of tumor necrosis factor, blocking of leukocyte adhesion, and limitation of thrombin-induced inflammatory responses. Relative contribution of effects on the reduction of mortality from sepsis is not completely understood.

Pharmacodynamics/Kinetics

Duration: Plasma nondetectable within 2 hours of discontinuation

Metabolism: Inactivated by endogenous plasma protease inhibitors; mean clearance: 40 L/hour; increased with severe sepsis (~50%)

Half-life elimination: 1.6 hours

Pharmacotherapy PearlsPrepared by recombinant DNA technology in human cell line

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: As with all drugs which may affect hemostasis, bleeding is the major adverse effect associated with drotrecogin alfa. Hemorrhage may occur at virtually any site; risk is dependent on multiple variables, including the dosage administered, concurrent use of multiple agents which alter hemostasis, and patient predisposition.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentConcomitant use with ginkgo and ginseng may increase the risk of bleeding

Anesthesia and Critical Care Concerns/Other ConsiderationsThe 2008 Surviving Sepsis Campaign guidelines suggest that adult patients with sepsis-induced organ dysfunction (APACHE II ≥25 or multiple organ failure) receive drotrecogen alfa if there are no contraindications (Grade 2B except for patients within 30 days of surgery [Grade 2C]). Relative contraindications need to be considered also. The guidelines recommend that adult patients with severe sepsis and low risk of death (APACHE II <20) or one organ failure should not receive drotrecogen alfa (Grade 1A).

PROWESS trial: The inclusion criteria for the PROWESS trial (Bernard, 2001) may help in patient selection since it is the first clinical trial evaluating a fixed dose of drotrecogin alfa in severe sepsis. The patients included had a known or suspected infection, three or more signs of systemic inflammatory syndrome (SIRS), and sepsis-induced acute organ dysfunction. Indicators of infection included: White cells in a normally sterile body fluid, perforated viscus, radiographic evidence of pneumonia in association with purulent sputum, a syndrome associated with a high risk of infection (eg, ascending cholangitis). Modified (SIRS) criteria (needed ≥3 criteria): A core temperature of ≥38°C (100.4°F) or ≤36°C (96.8°F); heart rate ≥90 bpm except in patients with a medical condition known to increase the heart rate or those receiving treatment that would prevent tachycardia; respiratory rate ≥20 breaths/minute, a $PaCO_2$ ≤32 mm Hg, or the use of mechanical ventilation; WBC count ≥12,000/mm^3, ≤4000/mm^3, or a differential count with >10% immature neutrophils. Criteria for organ dysfunction included arterial blood pressure ≤90 mm Hg or a MAP ≤70 mm Hg for at least 1 hour despite adequate fluid resuscitation, adequate intravascular volume status, or the use of vasopressors; urine output <0.5 mL/kg/hour for 1 hour despite adequate fluid resuscitation; PaO_2/FiO_2 ≤250 in the presence of other dysfunctional organ systems or ≤200 if the lung is the only dysfunctional organ; platelet count <80,000/mm^3 or acute decrease by 50%; unexplained metabolic acidosis with a high plasma lactate level.

Severe sepsis and a low risk of death: Recently a randomized, double-blind, placebo-controlled, multicenter, international trial (Abraham, 2005) was conducted to evaluate the safety and efficacy of drotrecogin alfa in adult patients with severe sepsis and a low risk of death (APACHE II score <25 or single-organ failure). Patients were randomized to a 96 hour infusion of normal saline or drotrecogin alfa at the FDA approved dose; 2640 patients were enrolled in the study. There was no statistical difference between the groups in 28-day mortality. Hemorrhage accounted for 2 deaths (0.9%) in the placebo group and 7 deaths (2.9%) in the drotrecogin alfa group (p = 0.02) during the infusion. Drotrecogin alfa should not be used in patients with severe sepsis who are at low risk of death because of a lack of efficacy and an increased incidence of bleeding. There was no difference in mortality between active treatment and placebo in these-low risk patients after one year of follow up (Laterre, 2007).

Stability: Drotrecogin alfa has a shorter stability time than was originally suggested. This may lead to some confusion. Additional studies (data on file, Lilly Research Laboratories) show that the final solution is stable for 14 hours at controlled room temperature 15°C to 30°C (59°F to 86°F). If not used immediately, a prepared solution may be stored in the refrigerator for up to 12 hours. The total expiration time (refrigeration and administration) should be ≤24 hours from time of preparation. Due to brief stability consider these dilutions for infusion pumps: 5 mg/50 mL, 10 mg/100 mL, 15 mg/150 mL, 20 mg/200 mL.

U.S. Brand NamesCymbalta®

Canadian Brand NamesCymbalta®

Pharmacologic CategoryAntidepressant, Serotonin/Norepinephrine Reuptake Inhibitor

Use: Labeled IndicationsAcute and maintenance treatment of major depressive disorder (MDD); treatment of generalized anxiety disorder (GAD); management of pain associated with diabetic neuropathy; management of fibromyalgia

Use: Unlabeled/InvestigationalTreatment of stress incontinence; management of chronic pain syndromes

Dosing: Adults

Major depressive disorder: Oral: Initial: 40-60 mg/day; dose may be divided (ie, 20 or 30 mg twice daily) or given as a single daily dose of 60 mg; maintenance: 60 mg once daily; for doses >60 mg/day, titrate dose in increments of 30 mg/day over 1 week as tolerated to a maximum dose: 120 mg/day. **Note:** Doses >60 mg/day have not been demonstrated to be more effective.

Diabetic neuropathy: Oral: 60 mg once daily; lower initial doses may be considered in patients where tolerability is a concern and/or renal impairment is present. **Note:** Doses up to 120 mg/day administered in clinical trials offered no additional benefit and were less well tolerated than dose of 60 mg/day.

Fibromyalgia: Oral: Initial: 30 mg/day for 1 week, then increase to 60 mg/day as tolerated. **Note:** Doses up to 120 mg/day administered in clinical trials offered no additional benefit and were less well tolerated than dose of 60 mg/day.

Generalized anxiety disorder: Oral: Initial: 30-60 mg/day as a single daily dose; patients initiated at 30 mg/day should be titrated to 60 mg/day after 1 week; maximum dose: 120 mg/day. **Note:** Doses >60 mg/day have not been demonstrated to be more effective.

Chronic pain syndromes (unlabeled use): Oral: 60 mg once daily

Stress incontinence (unlabeled use): Oral: 40 mg twice daily

Dosing: Elderly

Major depressive disorder: Oral: Manufacturer does not recommend specific dosage adjustment. Conservatively, may initiate at a dose of 20 mg 1-2 times/day; increase to 40-60 mg/day as a single daily dose or in divided doses **or** initiate therapy at 30 mg/day for 1 week then increase to 60 mg/day as tolerated.

Other indications: Refer to adult dosing.

Dosing: Renal ImpairmentNot recommended for use in Cl_{cr} <30 mL/minute or ESRD (contraindicated in Canadian labeling). In mild-moderate impairment, lower initial doses may be considered with titration guided by response and tolerability.

Dosing: Hepatic ImpairmentNot recommended for use in hepatic impairment (contraindicated in Canadian labeling).

Calculations

- Creatinine Clearance: Adults

Administration: OralCapsule should be swallowed whole; do not break open or crush.

Dietary ConsiderationsMay be taken without regard to meals.

StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F)

RestrictionsAn FDA-approved medication guide concerning the use of antidepressants in children, adolescents, and young adults must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm. Dispense to parents or guardians of children and adolescents receiving this medication.

ContraindicationsConcomitant use or within 2 weeks of MAO inhibitors; uncontrolled narrow-angle glaucoma

Canadian labeling: Additional contraindications (not in U.S. labeling): Hypersensitivity to duloxetine or any component of the formulation; hepatic impairment; severe renal impairment (eg, Cl_{cr} <30 mL/minute) or end-stage renal disease (ESRD); concomitant use with thioridazine or with CYP1A2 inhibitors

Allergy Considerations

- DULoxetine Allergy

Warnings/Precautions

Boxed warnings:

- Suicidal thinking/behavior: See “Major psychiatric warnings” below.

Major psychiatric warnings:

- **[U.S. Boxed Warning]: Antidepressants increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 years of age) with major depressive disorder (MDD) and other psychiatric disorders;** consider risk prior to prescribing. Short-term studies did not show an increased risk in patients >24 years of age and showed a decreased risk in patients ≥65 years. Closely monitor for clinical worsening, suicidality, or unusual changes in behavior; the patient’s family or caregiver should be instructed to closely observe the patient and communicate condition with healthcare provider. A medication guide concerning the use of antidepressants in children and teenagers should be dispensed with each prescription. **Duloxetine is not FDA approved for use in children.**

- The possibility of a suicide attempt is inherent in major depression and may persist until remission occurs. Patients treated with antidepressants should be observed for clinical worsening and suicidality, especially during the initial (generally first 1-2 months) few months of a course of drug therapy, or at times of dose changes, either increases or decreases. Worsening depression and severe abrupt suicidality that are not part of the presenting symptoms may require discontinuation or modification of drug therapy. Use caution in high-risk patients during initiation of therapy.

- Prescriptions should be written for the smallest quantity consistent with good patient care. The patient's family or caregiver should be alerted to monitor patients for the emergence of suicidality and associated behaviors such as anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, and mania; patients should be instructed to notify their healthcare provider if any of these symptoms or worsening depression or psychosis occur.

- May worsen psychosis in some patients or precipitate a shift to mania or hypomania in patients with bipolar disorder. Monotherapy in patients with bipolar disorder should be avoided. Patients presenting with depressive symptoms should be screened for bipolar disorder. **Duloxetine is not FDA approved for the treatment of bipolar depression.**

Concerns related to adverse effects:

- Bleeding risk: May impair platelet aggregation resulting in increased risk of bleeding events, particularly if used concomitantly with aspirin or NSAIDs due to ulcerogenic potential. Data are inconclusive regarding extent of bleeding risk of SNRIs in combination with warfarin or other anticoagulants. Bleeding related to SNRI use has been reported to range from relatively minor bruising and epistaxis to life-threatening hemorrhage.

- CNS depression: Has a low potential to impair cognitive or motor performance; caution operating hazardous machinery or driving.

- Hepatotoxicity: Avoid use in patients with substantial ethanol intake, evidence of chronic liver disease or hepatic impairment (contraindicated in Canadian labeling). Rare cases of hepatic failure (including fatalities) have been reported with use. Hepatitis with abdominal pain, hepatomegaly, elevated transaminase levels >20 times the upper limit of normal (ULN) with and without jaundice have all been observed. Discontinue therapy with the presentation of jaundice or other signs of hepatic dysfunction and do not reinitiate therapy unless another source or cause is identified.

- Hyperglycemia: Modest increases in serum glucose and hemoglobin A_{1c} (Hb A_{1c}) levels have been observed in some diabetic patients receiving duloxetine therapy for diabetic peripheral neuropathy (DPN).

- Orthostatic hypotension/syncope: May cause orthostatic hypotension/syncope, especially within the first week of therapy and after dose increases. Carefully monitor blood pressure with initiation of therapy, dose increases (especially in patients receiving >60 mg/day), or when using concomitant vasodilators or CYP1A2 inhibitors.

- Sexual dysfunction: May cause or exacerbate sexual dysfunction.

- SIADH and hyponatremia: SSRIs and SNRIs have been associated with the development of SIADH; hyponatremia has been reported rarely (including severe cases with serum sodium <110 mmol/L), predominately in the elderly. Volume depletion and/or concurrent use of diuretics likely increases risk.

- Urinary hesitancy: May cause increased urinary resistance; advise patient to report symptoms of urinary hesitation/difficulty.

Disease-related concerns:

- Hypertension: Use caution in patients with hypertension. Although no statistically significant differences in the frequency of sustained elevations of blood pressure were observed in clinical trials when compared with placebo, modest increases in blood pressure have been reported with use. Additionally, rare cases of hypertensive crisis have been reported in patients with pre-existing hypertension; blood pressure should be evaluated prior to initiating therapy and periodically thereafter; consider dose reduction or gradual discontinuation of therapy in individuals with sustained hypertension during therapy

- Narrow-angle glaucoma: Associated with an increased risk of mydriasis in patients with controlled narrow-angle glaucoma.

- Renal impairment: Use with caution; clearance is decreased and plasma concentrations are increased; not recommended for use when Cl_{cr} <30 mL/minute or ESRD (contraindicated in Canadian labeling).

- Seizure disorders: Use caution with a previous seizure disorder or condition predisposing to seizures such as brain damage or alcoholism.

Concurrent drug therapy issues:

- Agents which lower seizure threshold: Concurrent therapy with other drugs which lower the seizure threshold.

- Anticoagulants/antiplatelets: Use caution with concomitant use of NSAIDs, ASA, or other drugs that affect coagulation; the risk of bleeding may be potentiated.

- CNS depressants: Use caution with concomitant therapy.
- CYP1A2 inhibitors (eg, fluvoxamine, ciprofloxacin): Concomitant use with duloxetine may increase levels/adverse effects of duloxetine and is not recommended (contraindicated in Canadian labeling).
- MAO inhibitors: Potential for severe reaction when used with MAO inhibitors; autonomic instability, coma, death, delirium, diaphoresis, hyperthermia, mental status changes/agitation, muscular rigidity, myoclonus, neuroleptic malignant syndrome features, and seizures may occur.
- Serotonin modulators: Serotonin syndrome with symptoms of agitation, confusion, hallucinations, hyper-reflexia, myoclonus, shivering, nausea/vomiting, diarrhea, and tachycardia may occur with concomitant proserotonergic drugs (ie, SSRIs/SNRIs or triptans) or agents which reduce duloxetine's metabolism. Concurrent use of serotonin precursors (eg, tryptophan) is not recommended.
- Thioridazine: Concomitant use is contraindicated in Canadian labeling.

Special populations:

- Sucrose intolerance: Formulation contains sucrose; patients with fructose intolerance, glucose-galactose malabsorption, or sucrose-isomaltase deficiency should avoid use

Other warnings/precautions:

- Electroconvulsive therapy: May increase the risks associated with electroconvulsive therapy; consider discontinuing, when possible, prior to ECT treatment.
- Withdrawal syndrome: May cause dysphoric mood, irritability, agitation, dizziness, sensory disturbances, anxiety, confusion, headache, lethargy, emotional lability, insomnia, hypomania, tinnitus, and seizures. To discontinue therapy with duloxetine, gradually taper dose. If intolerable symptoms occur following a decrease in dosage or upon discontinuation of therapy, then resuming the previous dose with a more gradual taper should be considered.

Geriatric ConsiderationsIn an 8-week study of elderly patients with a history of recurrent major depressive disorder, improvements in verbal learning and memory, and depression response and remission rates were significantly greater in subjects randomized to duloxetine 60 mg per day compared to placebo. Duloxetine was well tolerated. No dose adjustment is necessary for age alone; adjust dose for renal function in the elderly. Higher doses are generally required for treatment of general anxiety disorder, neuropathic pain and stress urinary incontinence (unlabeled use). The elderly are more prone to SSRI/SNRI-induced hyponatremia.

Pregnancy Risk FactorC

Pregnancy ConsiderationsDuloxetine is classified as pregnancy category C due to adverse effects observed in animal studies. Nonteratogenic effects in the newborn following SSRI/SNRI exposure late in the third trimester include respiratory distress, cyanosis, apnea, seizures, temperature instability, feeding difficulty, vomiting, hypoglycemia, hyper- or hypotonia, hyper-reflexia, jitteriness, irritability, constant crying, and tremor. The long-term effects on neurobehavior have not been studied.

Women treated for major depression and who are euthymic prior to pregnancy are more likely to experience a relapse when medication is discontinued as compared to pregnant women who continue taking antidepressant medications. The ACOG recommends that therapy with SSRIs or SNRIs during pregnancy be individualized; treatment of depression during pregnancy should incorporate the clinical expertise of the mental health clinician, obstetrician, primary healthcare provider, and pediatrician. If treatment during pregnancy is required, consider tapering therapy during the third trimester in order to prevent withdrawal symptoms in the infant. If this is done and the woman is considered to be at risk of relapse from her major depressive disorder, the medication can be restarted following delivery, although the dose should be readjusted to that required before pregnancy.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsDuloxetine is excreted in human milk. The average relative dose to the infant was calculated to be ~0.14% (maximum: 0.25%) of the weight-adjusted maternal dose. Duloxetine is not stable at an acidic pH; therefore, any drug which reaches the stomach of the breast-feeding infant may degrade, thus decreasing the amount reaching the systemic circulation. Breast-feeding is not recommended by the manufacturer. The long term effects on neurobehavior have not been studied, thus one should prescribe duloxetine to a mother who is breast-feeding only when the benefits outweigh the potential risks.

Pregnancy & Lactation, In-Depth

- DULoxetine in Pregnancy & Lactation

Adverse Reactions

>10%:

Central nervous system: Fatigue (2% to 15%), somnolence (7% to 21%), dizziness (6% to 17%), headache (13% to 20%), insomnia (8% to 16%)

Gastrointestinal: Nausea (14% to 30%), xerostomia (5% to 18%), diarrhea (7% to 13%), constipation (5% to 15%), appetite decreased (3% to 11%)

1% to 10%:

Cardiovascular: Palpitation (1% to 2%)

Central nervous system: Agitation (5% to 6%), anxiety (3%), sleep disorder (3%), dreams abnormal (2% to 3%), fever (1% to 3%), yawning (1% to 2%), hypoesthesia (1%), lethargy (1%), nightmares (1%), vertigo (1%)

Dermatologic: Hyperhydrosis (6% to 8%), rash (4%), pruritus (3%)

Endocrine & metabolic: Libido decreased (2% to 4%), orgasm abnormality (3%), hot flushes (2% to 3%), anorgasmia (1%)

Gastrointestinal: Vomiting (5% to 6%), dyspepsia (4% to 5%), anorexia (3% to 5%), loose stools (2% to 3%), taste abnormal (1% to 3%), weight gain/loss (2%), flatulence (1%)

Genitourinary: Erectile dysfunction (1% to 5%), pollakiuria (1% to 5%), ejaculatory dysfunction (2% to 4%), ejaculation delayed (3%), penis disorder (2%)

Hepatic: ALT >3x ULN (1%)

Neuromuscular & skeletal: Weakness (2% to 8%), musculoskeletal pain (1% to 5%), muscle cramp (4% to 5%), muscle spasms (4%), tremor (3% to 4%), myalgia (1% to 4%), paresthesia (1%), rigors (1%)

Ocular: Blurred vision (1% to 3%)

Respiratory: Nasopharyngitis (7% to 9%), upper respiratory infection (7%), cough (3% to 6%), pharyngolaryngeal pain (1% to 6%)

Miscellaneous: Diaphoresis increased (6%), seasonal allergies (3%)

<1%, postmarketing, and/or case reports: Abdominal pain, acne, agitation, aggression, alkaline phosphatase increased, alopecia, anaphylactic reaction, anger, anemia, angioneurotic edema, aphthous stomatitis, ataxia, atrial fibrillation, bloody stools, bundle branch block, CHF, colitis, CPK increased, dehydration, diastolic blood pressure increased, diplopia, disorientation, diverticulitis, dysarthria, dyskinesia, dyslipidemia, dysphagia, dysuria, ecchymosis, eczema, edema (peripheral), erythema, erythema multiforme, esophageal stenosis, EPS, facial edema, flu-like syndrome, flushing, gastric emptying impaired, gastric ulcer, gastritis, gastroenteritis, GI bleeding, gingivitis, glaucoma, hallucinations, Hb A_{1c} increased, hematochezia, hepatic failure, hepatic steatosis, hepatitis, hepatomegaly, hyperbilirubinemia, hypercholesterolemia, hyperglycemia, hyperlipidemia, hypersensitivity, hypertensive crisis, hyponatremia, hypothyroidism, irritability, irritable bowel syndrome, jaundice, keroconjunctivitis sicca, laryngitis, leukopenia, lymphadenopathy, macular degeneration, maculopathy, malaise, mania, melena, MI, micturition urgency, mood swings, muscle spasm, muscle tightness, muscle twitching, nephropathy, night sweats, nocturia, oropharyngeal edema, orthostatic hypotension, peripheral coldness, phlebitis, photosensitivity, polyuria, retinal detachment, seizure, serotonin syndrome, sexual dysfunction, SIADH, Stevens-Johnson syndrome, stomatitis, suicide, supraventricular arrhythmia, syncope, systolic blood pressure increased, tachycardia, thirst, throat tightness, thrombocytopenia, tinnitus, transaminases increased, trismus, urinary retention, urticaria, visual disturbance; withdrawal syndrome (including headache, dizziness, nightmares, irritability, paresthesia, and/or vomiting)

Metabolism/Transport Effects **Substrate** (major) of CYP1A2, 2D6; **inhibits** CYP2D6 (moderate)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alpha-/Beta-Agonists: Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor) may enhance the tachycardic effect of Alpha-/Beta-Agonists. Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor) may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Aspirin: Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor) may enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Codeine: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

CYP1A2 Inducers (Strong): May increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

CYP2D6 Substrates: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk C: Monitor therapy*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Fluvoxamine: May decrease the metabolism of DULoxetine. *Risk C: Monitor therapy*

Iobenguane I 123: Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor) may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the serotonergic effect of Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor). This may cause serotonin syndrome. *Risk X: Avoid combination*

Nebivolol: CYP2D6 Inhibitors (Moderate) may increase the serum concentration of Nebivolol. *Risk C: Monitor therapy*

NSAID (Nonselective): Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor) may enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

PARoxetine: May decrease the metabolism of DULoxetine. *Risk C: Monitor therapy*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Tamoxifen: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of Tamoxifen. Specifically, CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk D: Consider therapy modification*

Thioridazine: CYP2D6 Inhibitors may decrease the metabolism of Thioridazine. *Risk X: Avoid combination*

TraMADol: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

Tricyclic Antidepressants: DULoxetine may decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression and/or hepatotoxic potential of duloxetine).

Herb/Nutraceutical: Avoid valerian, St John's wort, SAMe, kava kava, and gotu kola (may increase CNS depression).

Monitoring ParametersBlood pressure should be checked prior to initiating therapy and then regularly monitored, especially in patients with a high baseline blood pressure; mental status for depression, suicidal ideation (especially at the beginning of therapy or when doses are increased or decreased), anxiety, social functioning, mania, panic attacks; glucose levels and Hb A_{1c} levels in diabetic patients, creatinine, BUN, transaminases

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and potential interactions. Monitor blood pressure (can cause elevation or orthostatic hypotension) at the beginning of treatment and periodically throughout treatment. Monitor for worsening of depression and suicide ideation. Taper dosage slowly when discontinuing. Do not discontinue abruptly. Assess knowledge/teach appropriate use of this medication, interventions to reduce side effects and adverse reactions.

Monitoring: Lab TestsGlucose levels and Hb A_{1c} levels in diabetic patients, creatinine, BUN, transaminases

Patient EducationTake exactly as directed. Swallow capsule whole; do not open or crush. It may take 2-3 weeks to achieve desired results. Inform prescriber of all prescription medications, OTC medications, or herbal products you are taking. Maintain adequate hydration (2-3 L/day of fluid) unless instructed to restrict fluid intake by prescriber. Avoid alcohol use. If you have diabetes, monitor blood glucose levels closely. May cause increase in glycemic levels. Can cause drowsiness, dizziness, fatigue, insomnia (use caution when driving or engaging in activities requiring alertness until response to drug is known). You may experience headache, nausea, diarrhea (buttermilk, yogurt, or boiled milk may help), constipation (increased exercise, fluids, fruit, or fiber may help), appetite decrease, or xerostomia. Report persistent insomnia, dizziness, headache, thoughts of suicide, worsening of anxiety, panic attacks, agitation, irritability, akathisia, hostility, hypomania, mania. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber before breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, delayed release, enteric coated pellets:

Cymbalta®: 20 mg, 30 mg, 60 mg

Generic AvailableNo

ManufacturerEli Lilly and Co

Pricing: U.S. (www.drugstore.com)

Capsule, enteric pellets (Cymbalta)

20 mg (30): $120.83

30 mg (30): $130.32

60 mg (30): $131.39

Mechanism of ActionDuloxetine is a potent inhibitor of neuronal serotonin and norepinephrine reuptake and a weak inhibitor of dopamine reuptake. Duloxetine has no significant activity for muscarinic cholinergic, H_1-histaminergic, or alpha$_2$-adrenergic receptors. Duloxetine does not possess MAO-inhibitory activity.

Pharmacodynamics/Kinetics

Absorption: Well absorbed, 2-hour delay in absorption after ingestion; food decreases extent of absorption ~10% (no effect on C_{max})

Distribution: 1640 L (range: 701-3800 L)

Protein binding: >90%; primarily to albumin and α_1-acid glycoprotein

Metabolism: Hepatic, via CYP1A2 and CYP2D6; forms multiple metabolites (inactive)

Half-life elimination: 12 hours (range 8-17 hours)

Time to peak: 6 hours; 10 hours when ingested with food

Excretion: As metabolites; urine (72%), feces (19%)

Related Information

- Antidepressant Agents
- Antidepressant Receptor Profile

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsAlthough duloxetine is not a tricyclic antidepressant, it does block norepinephrine reuptake within the CNS synapses as part of its mechanism. It has been suggested that vasoconstrictors be administered with caution and to monitor vital signs in dental patients taking antidepressants that affect norepinephrine in this way.

Dutasteride

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(doo TAS teer ide)

U.S. Brand NamesAvodart®

Canadian Brand NamesAvodart®

Pharmacologic Category5 Alpha-Reductase Inhibitor

Use: Labeled IndicationsTreatment of symptomatic benign prostatic hyperplasia (BPH) as monotherapy or combination therapy with tamsulosin

Use: Unlabeled/InvestigationalTreatment of male patterned baldness

Dosing: AdultsMales: Benign prostatic hyperplasia: Oral: 0.5 mg once daily alone or in combination with tamsulosin

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNo adjustment is required.

Dosing: Hepatic ImpairmentUse caution; no specific adjustments recommended.

Administration: OralMay be administered with or without food. Capsule should be swallowed whole; do not chew or open; contact with opened capsule can cause oropharyngeal irritation. Should not be touched or handled by women who are pregnant or are of childbearing age.

Dietary ConsiderationsMay be taken with or without food.

StorageStore at controlled room temperature of 25°C (77°F).

ContraindicationsHypersensitivity to dutasteride, other 5α-reductase inhibitors (eg, finasteride), or any component of the formulation; not indicated for use in women or children; pregnant women or women trying to conceive should not handle the product

Allergy Considerations

- Dutasteride Allergy

Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.
- Women/pregnancy: Women can absorb the active ingredient through the skin and should always use caution whenever handling. Pregnant women or women trying to conceive should not handle the product; dutasteride may negatively impact fetal development.

Disease-related concerns:

- Diminished urinary flow: Carefully monitor patients with a large residual urinary volume or severely diminished urinary flow for obstructive uropathy; these patients may not be candidates for dutasteride therapy.
- Hepatic impairment: Use with caution in patients with hepatic impairment.

Concurrent drug therapy issues:

- CYP3A4 inhibitors: Use with caution with concurrent use of potent, chronic CYP3A4 inhibitors.

Other warnings/precautions:

- Appropriate use: Other urological diseases including cancer should be ruled out before initiating therapy.
- Blood donation: Avoid donating blood during or for 6 months following treatment due to risk of administration to a pregnant female transfusion recipient.
- PSA monitoring: Reduces prostate specific antigen (PSA) by 40% following 3 months of use and 50% after 6-24 months of use. If following serial PSAs, re-establish a new baseline after 3-6 months of use. If interpreting an isolated PSA value in a patient treated for 6 months, then double the PSA value for comparison.

Pregnancy Risk FactorX

Pregnancy ConsiderationsPreclinical data (animal studies) suggests that the suppression of circulating levels of dihydrotestosterone may inhibit the development of the external genital organs and lead to feminization of a male fetus carried by a woman exposed to dutasteride. Pregnant woman and those who may become pregnant should not handle the capsules because dutasteride is absorbed through the skin. It is distributed into the semen.

LactationExcretion in breast milk unknown/contraindicated

Adverse Reactions

>10%: Endocrine & metabolic: Serum testosterone increased, thyroid-stimulating hormone increased

1% to 10%: Endocrine & metabolic: Impotence (1% to 5%), libido decreased (≤3%), ejaculation disorders (≤1%), gynecomastia (including breast tenderness, breast enlargement; ≤1%)

<1%, postmarketing, and/or case reports: Allergic reaction, angioedema, dizziness, edema (localized), hypersensitivity, pruritus, rash, skin

reactions (serious), urticaria

Note: Frequency of adverse events (except gynecomastia) tends to decrease with continued use (>6 months).

Metabolism/Transport Effects**Substrate** of CYP3A4 (minor)
Drug InteractionsThere are no known significant interactions.
Ethanol/Nutrition/Herb Interactions

Ethanol: No effect or interaction noted.

Food: Maximum serum concentrations reduced by 10% to 15% when taken with food; not clinically significant.

Herb/Nutraceutical: St John's wort may decrease dutasteride levels. Avoid saw palmetto (concurrent use has not been adequately studied).

Test InteractionsPSA levels decrease in treated patients. After 6 months of therapy, PSA levels stabilize to a new baseline that is ~50% of pretreatment values. If following serial PSAs in a patient, re-establish a new baseline after 3-6 months of use. If interpreting an isolated PSA value in a patient treated for 6 months, then double the PSA value for comparison.
Monitoring ParametersObjective and subjective signs of relief of benign prostatic hyperplasia, including improvement in urinary flow, reduction in symptoms of urgency, and relief of difficulty in micturition; new baseline PSA level after 3-6 months of therapy
Monitoring: Lab Tests

New baseline PSA level after 3-6 months of therapy

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, softgel:

Avodart®: 0.5 mg

Generic AvailableNo
ManufacturerGlaxoSmithKline
Pricing: U.S. (www.drugstore.com)

Capsules (Avodart)

0.5 mg (30): $98.26

Mechanism of ActionDutasteride is a 4-azo analog of testosterone and is a competitive, selective inhibitor of both reproductive tissues (type 2) and skin and hepatic (type 1) 5α-reductase. This results in inhibition of the conversion of testosterone to dihydrotestosterone and markedly suppresses serum dihydrotestosterone levels.
Pharmacodynamics/Kinetics

Absorption: Via skin when handling capsules

Distribution: V_d: 300-500 L, ~12% of serum concentrations partitioned into semen

Protein binding: 99% to albumin; ~97% to α_1-acid glycoprotein; >96% to semen protein

Metabolism: Hepatic via CYP3A4 isoenzyme; forms metabolites: 6-hydroxydutasteride has activity similar to parent compound, 4'-hydroxydutasteride and 1,2-dihydrodutasteride are much less potent than parent *in vitro*

Bioavailability: ~60% (range: 40% to 94%)

Half-life elimination: Terminal: ~5 weeks

Time to peak: 2-3 hours

Excretion: Feces (40% as metabolites, 5% as unchanged drug); urine (<1% as unchanged drug); 55% of dose unaccounted for

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNefazodone may increase dutasteride levels
International Brand NamesAvidart (ES); Avodart (AR, BE, BG, CH, CN, CZ, DE, DK, EE, FI, FR, GB, HK, HN, ID, IE, IL, IT, KP, MX, MY, NL, NO, PH, PT, SE, SG, TH, TW); Duprost (IN)

Dyclonine

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Dyclonine may be confused with dicyclomine

Pronunciation(DYE kloe neen)
U.S. Brand NamesCēpacol® Dual Action Maximum Strength [OTC]; Sucrets® [OTC]
Pharmacologic CategoryLocal Anesthetic, Oral
Use: Labeled IndicationsTemporary relief of pain associated with oral mucosa
Dosing: AdultsTemporary relief of pain: Oral topical:

Lozenge: One lozenge every 2 hours as needed (maximum: 10 lozenges/day)

Spray: 1-4 sprays, up to 4 times a day

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricTemporary relief of pain: Oral topical:

Lozenge: Children ≥2 years: Refer to adult dosing.

Spray:

Children ≥3-12 years: 1-3 sprays, up to 4 times a day

Children ≥12 years: Refer to adult dosing.

Administration: OralAllow lozenge to slowly dissolve in mouth.
Dietary ConsiderationsTopical anesthetics may impair swallowing or eating.
ContraindicationsHypersensitivity to dyclonine or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Aspiration: Topical anesthetics may impair swallowing, eating, and may enhance the danger of aspiration.

Special populations:

- Acutely ill/debilitated patients: Use with caution in acutely ill or debilitated patients; risks of systemic toxicity (CNS exacerbation, myocardial depression) may be increased, particularly at excessive dosages.

- Elderly: Use with caution in the elderly; may be at increased risk of adverse effects.

- Pediatrics: Use with caution in children; may be at increased risk of adverse effects.

Other warnings/precautions:

- Area of application: Topical anesthetics should be used with caution in patients with sepsis or traumatized mucosa in the area of application to avoid rapid systemic absorption.

- Self-medication (OTC use): When used for self-medication (OTC) patients should contact healthcare provider if symptoms worsen or last for >7 days. When treating a severe sore throat, patients should contact healthcare provider if symptoms lasts >2 days, occur with fever, headache, rash, nausea, or vomiting. Not for OTC use in children <2 years of age.

Adverse ReactionsThe following were reported with the previously available 0.5% and 1% topical solutions; effects are similar to other local anesthetic agents and are generally dose related; frequency not defined:

Cardiovascular: Bradycardia, hypotension

Central nervous system: Apprehension, confusion, convulsion, dizziness, drowsiness, euphoria, lightheadedness, nervousness

Gastrointestinal: Vomiting

Neuromuscular & skeletal: Numbness, tremor, twitching

Ocular: Blurred vision, double vision

Otic: Tinnitus

Respiratory: Respiratory depression

Miscellaneous: Allergic reactions, cold/heat sensation

Drug InteractionsThere are no known significant interactions.

Nursing: Physical Assessment/MonitoringMonitor for effectiveness of anesthesia and for adverse or toxic reactions. Monitor for return of sensation. Teach patient adverse reactions to report; use and teach appropriate interventions to promote safety.

Patient EducationThis medication is given to reduce sensation in the injected area. When used in mouth or throat; do not eat or drink anything for at least 1 hour following treatment. Take small sips of water at first to ensure that you can swallow without difficulty. Your tongue and mouth may be numb, use caution to avoid biting yourself. Immediately report swelling of face, lips, tongue; chest pain or palpitations; increased restlessness, confusion, anxiety, or dizziness. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Lozenge, as hydrochloride (Sucrets®): 1.2 mg [children’s cherry flavor]; 2 mg [wild cherry and assorted flavors]; 3 mg [vapor black cherry and wintergreen flavors]

Spray, oral, as hydrochloride (Cēpacol® Dual Action Maximum Strength): 0.1% (120 mL) [contains glycerin 33%; cherry, honey lemon and cool menthol flavors]

Generic AvailableNo

Pharmacodynamics/Kinetics

Onset of action: Local anesthetic: 2-10 minutes

Duration: ~30 minutes

Absorption: Systemic absorption increased in presence of severely traumatized mucosa

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusRare reports of drowsiness, dizziness, nervousness, and excitation

Mental Health: Effects on Psychiatric TreatmentNone reported

Dyphylline and Guaifenesin

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(DYE fi lin & gwye FEN e sin)
U.S. Brand NamesCOPD; Difil-G; Difil®-G Forte; Dilex-G; Dilor-G®; Lufyllin®-GG
Pharmacologic CategoryExpectorant; Theophylline Derivative
Use: Labeled IndicationsTreatment of bronchial asthma and reversible bronchospasm associated with chronic bronchitis and emphysema
Dosing: AdultsAsthma/bronchospasm: Oral:

Elixir: Lufyllin®-GG: 30 mL 4 times/day

Syrup:

Dilex-G: 5-10 mL 4 times/day

Difil®-G Forte: 5-10 mL 3 or 4 times/day; may double or triple (in severe cases) according to patient response

Tablet: Difil®-G, Dilex-G, Lufyllin®-GG: One tablet 3 or 4 times/day

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricAsthma/bronchospasm: Oral:

Children 6-12 years:

Elixir: Lufyllin®-GG: 15-30 mL 3 or 4 times/day

Syrup: Dilex-G:

18-27 kg: 1.25-1.6 mL 4 times/day

27-36 kg: 2.5-3.3 mL 4 times/day

36.5-45 kg: 3.3-3.7 mL 4 times/day

Tablet: Lufyllin®-GG: $^1/_2$ -1 tablet 3 or 4 times/day

Children >12 years: Refer to adult dosing.

Dosing: Renal ImpairmentDosage reduction should be considered in severe renal impairment. Half-life of dyphylline is significantly prolonged in anuria.
Administration: OralAdminister after meals to decrease stomach irritation.
StorageStore at room temperature.
ContraindicationsHypersensitivity to dyphylline, guaifenesin, or any component of the formulation
Warnings/Precautions

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with severe cardiac disease including, acute myocardial injury, hypertension, and heart failure.
- Hyperthyroidism: Use with caution in patients with hyperthyroidism.
- Peptic ulcer disease: Use with caution in patient with peptic ulcer disease.
- Renal impairment: Use with caution in patients with severe renal impairment.
- Status asthmaticus: Xanthine derivatives, including theophylline, are not indicated for the management of status asthmaticus.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <6 years of age.

Geriatric ConsiderationsThere is a lack of significant studies to document the efficacy of guaifenesin. Best to encourage adequate hydration to enhance response to guaifenesin since elderly have a blunted thirst reflex. Elderly are at greater risk for toxicity due to concomitant disease (eg, CHF, arrhythmias); therefore, start at lowest recommended doses.
Pregnancy Risk FactorC
Pregnancy ConsiderationsAnimal reproduction studies have not been conducted with this combination. Use during pregnancy only when clearly needed.
LactationEnters breast milk/use caution
Breast-Feeding ConsiderationsDyphylline is present in breast milk at approximately twice the maternal plasma concentration.

Adverse ReactionsFrequency not defined. Also see individual agents.

Cardiovascular: Circulatory failure, extrasystoles, flushing, hypotension, palpitation, tachycardia, ventricular arrhythmias

Central nervous system: Agitation, dizziness, drowsiness, headache, hyperexcitability, insomnia, irritability, restlessness, seizure (generalized tonic-clonic)

Endocrine & metabolic: Hyperglycemia, SIADH, uric acid serum concentration decreased

Gastrointestinal: Diarrhea, epigastric pain, hematemesis, nausea, vomiting

Neuromuscular: Muscle twitching

Renal: Albuminuria, diuresis, hematuria

Respiratory: Tachypnea

Drug Interactions

Adenosine: Theophylline Derivatives may diminish the therapeutic effect of Adenosine. *Risk D: Consider therapy modification*

Benzodiazepines: Theophylline Derivatives may diminish the therapeutic effect of Benzodiazepines. *Risk D: Consider therapy modification*

Beta-Blockers (Beta1 Selective): May diminish the bronchodilatory effect of Theophylline Derivatives. This is true at higher beta-blockers doses where cardioselectivity is lost. *Risk C: Monitor therapy*

Beta-Blockers (Nonselective): May diminish the bronchodilatory effect of Theophylline Derivatives. *Risk D: Consider therapy modification*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Uricosuric Agents: May decrease the excretion of Theophylline Derivatives. *Risk C: Monitor therapy*

Test InteractionsGuaifenesin: Possible color interference with determination of 5-HIAA and VMA; discontinue for 48 hours prior to test.

Nursing: Physical Assessment/MonitoringSee individual agent for Guaifenesin.

Patient EducationSee individual agent for Guaifenesin.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Elixir: Dyphylline 100 mg and guaifenesin 100 mg per 15 mL (480 mL)

Lufyllin®-GG: Dyphylline 100 mg and guaifenesin 100 mg per 15 mL (480 mL) [contains alcohol 17%; wine-like flavor]

Liquid: Dyphylline 100 mg and guaifenesin 100 mg per 5 mL (480 mL)

Difil®-G Forte: Dyphylline 100 mg and guaifenesin 100 mg per 5 mL (240 mL) [menthol flavor]

Syrup:

Dilex-G: Dyphylline 100 mg and guaifenesin 200 mg per 5 mL (480 mL) [alcohol free, dye free, and sugar free]

Tablet: Dyphylline 200 mg and guaifenesin 200 mg

COPD, Lufyllin®-GG: Dyphylline 200 mg and guaifenesin 200 mg

Difil®-G: Dyphylline 200 mg and guaifenesin 300 mg

Dilex-G: Dyphylline 200 mg and guaifenesin 400 mg

Generic AvailableYes: Excludes syrup

Pricing: U.S. (www.drugstore.com)

Elixir (Lufyllin-GG)

100-100 mg/15 mL (480): $228.96

Tablets (Dyphylline-Guaifenesin)

200-200 mg (100): $39.47

Tablets (Lufyllin-GG)

200-200 mg (120): $400.97

Mechanism of Action

Dyphylline primarily causes bronchodilation by competitively inhibiting phosphodiesterases resulting in the increase of cyclic AMP and the relaxation of bronchial smooth muscles.

Guaifenesin is thought to act as an expectorant by irritating the gastric mucosa and stimulating respiratory tract secretions, thereby increasing respiratory fluid volumes and decreasing phlegm viscosity.

Pharmacodynamics/Kinetics See individual agents.

Mental Health: Effects on Mental Status May cause agitation, dizziness, drowsiness, hyperexcitability, insomnia, irritability, nervousness, or restlessness

Mental Health: Effects on Psychiatric Treatment May decrease serum lithium levels, monitor; barbiturates and carbamazepine may decrease dyphylline levels; may antagonize effects of benzodiazepines

Index Terms Guaifenesin and Dyphylline

Medication Safety Issues

International issues:

Dilor® [Canada] may be confused with Dilar® which is a brand name for paramethasone in France and Mexico

Pronunciation(DYE fi lin)

U.S. Brand NamesDylix; Lufyllin®

Canadian Brand NamesDilor®; Lufyllin®

Pharmacologic CategoryTheophylline Derivative

Use: Labeled IndicationsBronchodilator in reversible airway obstruction due to asthma, chronic bronchitis, or emphysema

Dosing: AdultsBronchoconstriction (asthma, COPD): Oral: Up to 15 mg/kg 4 times/day, individualize dosage

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} 50-80 mL/minute: Administer 75% of normal dose.

Cl_{cr} 10-50 mL/minute: Administer 50% of normal dose.

Cl_{cr} <10 mL/minute: Administer 25% of normal dose.

Calculations

- Creatinine Clearance: Adults

Dietary ConsiderationsShould be taken with water 1 hour before or 1 hour after meals.

StorageStore at controlled room temperature.

ContraindicationsHypersensitivity to dyphylline, xanthine compounds, or any component of the formulation; status asthmaticus

Warnings/Precautions

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with severe cardiac disease including, acute myocardial injury, hypertension, and heart failure.
- Hyperthyroidism: Use with caution in patients with hyperthyroidism.
- Peptic ulcer disease: Use with caution in patient with peptic ulcer disease.
- Renal impairment: Use with caution in patients with renal impairment; dose adjustment may be required.
- Status asthmaticus: Xanthine derivatives, including theophylline, are not indicated for the management of status asthmaticus.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsBreast milk concentrations are ~2 times the maternal serum concentration.

Adverse ReactionsFrequency not defined. Reactions reported with other xanthine derivatives and may be dose related.

Cardiovascular: Circulatory failure, extrasystoles, flushing, hypotension, palpitation, tachycardia, ventricular arrhythmias

Central nervous system: Agitation, convulsion, fever, headache, hyperexcitability, insomnia, irritability, restlessness

Endocrine & metabolic: ADH syndrome, dehydration, hyperglycemia

Gastrointestinal: Diarrhea, epigastric pain, hematemesis, nausea, vomiting

Neuromuscular & skeletal: Muscle twitching

Renal: Albuminuria, diuresis, hematuria

Respiratory: Respiratory arrest, tachypnea

Drug Interactions

Adenosine: Theophylline Derivatives may diminish the therapeutic effect of Adenosine. *Risk D: Consider therapy modification*

Benzodiazepines: Theophylline Derivatives may diminish the therapeutic effect of Benzodiazepines. *Risk D: Consider therapy modification*

Beta-Blockers (Beta1 Selective): May diminish the bronchodilatory effect of Theophylline Derivatives. This is true at higher beta-blockers doses where cardioselectivity is lost. *Risk C: Monitor therapy*

Beta-Blockers (Nonselective): May diminish the bronchodilatory effect of Theophylline Derivatives. *Risk D: Consider therapy modification*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Uricosuric Agents: May decrease the excretion of Theophylline Derivatives. *Risk C: Monitor therapy*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Elixir:

Dylix: 100 mg/15 mL (473 mL) [contains alcohol 20%]

Tablet:

Lufyllin®: 200 mg, 400 mg

Generic AvailableYes: Elixir

Pricing: U.S. (www.drugstore.com)

Tablets (Lufyllin)

200 mg (120): $308.16

400 mg (120): $451.51

Mechanism of ActionCauses bronchodilatation, through phosphodiesterase inhibition which increases concentrations of cyclic adenine monophosphate (cAMP) and produces relaxation of bronchial smooth muscle.

Pharmacodynamics/Kinetics

Metabolism: Not converted to free theophylline *in vivo*

Half-life elimination: ~2 hours

Time to peak, plasma: ~45 minutes

Excretion: Urine (88% as unchanged drug)

Related Information

- Theophylline

Dental Health: Effects on Dental TreatmentDo not prescribe any erythromycin product to patients taking theophylline products. Erythromycin will delay the normal metabolic inactivation of theophyllines leading to increased blood levels; this has resulted in nausea, vomiting and CNS restlessness.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause nervousness, restlessness, or insomnia

Mental Health: Effects on Psychiatric TreatmentMay decrease serum lithium levels; monitor; barbiturates and carbamazepine may decrease dyphylline levels; may antagonize effects of benzodiazepines

Index TermsDihydroxypropyl Theophylline

International Brand NamesDilor (CA); Diprophylline (RU); Dydilene (KR); Lufyllin (CA); Neophyllin-M (KR); Neutraphylline (BE)

Echothiophate Iodide

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(ek oh THYE oh fate EYE oh dide)

U.S. Brand NamesPhospholine Iodide®

Pharmacologic CategoryAcetylcholinesterase Inhibitor; Ophthalmic Agent, Antiglaucoma; Ophthalmic Agent, Miotic

Use: Labeled IndicationsUsed as miotic in treatment of chronic, open-angle glaucoma; may be useful in specific cases of angle-closure glaucoma (postiridectomy or where surgery refused/contraindicated); postcataract surgery-related glaucoma; accommodative esotropia

Dosing: Adults**Open-angle or secondary glaucoma:** Ophthalmic:

Initial: Instill 1 drop (0.03%) twice daily into eyes with 1 dose just prior to bedtime

Maintenance: Some patients have been treated with 1 dose daily or every other day

Conversion from other ophthalmic agents: If IOP control was unsatisfactory, patients may be expected to require higher doses of echothiophate (eg, ≥0.06%); however, patients should be initially started on the 0.03% strength for a short period to better tolerance.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Accommodative esotropia:** Ophthalmic:

Diagnosis: Instill 1 drop (0.125%) once daily into both eyes at bedtime for 2-3 weeks

Treatment: Usual dose: 1 drop of 0.06% once daily or 0.125% every other day (maximum: 0.125% daily). **Note:** Use lowest concentration and frequency which gives satisfactory response; if necessary, doses >0.125% daily may be used for short periods of time.

Administration: Other

Proper administration technique is required for maximal benefit. The nasolacrimal duct(s) should be compressed for 1-2 minutes after instillation of the drops. Excess fluid around the eye should be blotted with tissue, and any contact of medication to the hands should be immediately washed off.

StorageStore undiluted vials at room temperature of 2°C to 8°C (36°F to 46°F). Reconstituted solutions remain stable for 30 days at room temperature or 6 months when refrigerated.

ContraindicationsHypersensitivity to echothiophate or any component of the formulation; most cases of angle-closure glaucoma; active uveal inflammation

Warnings/Precautions

Concerns related to adverse effects:

- Cardiac irregularities: Discontinue if cardiac irregularities occur.
- Cholinergic effects: Discontinue if symptoms of excess cholinergic activity (eg, salivation, sweating, urinary incontinence); overdosage may result in cholinergic crisis, which must be distinguished from myasthenic crisis.
- Cholinesterase levels: May depress plasma and erythrocyte cholinesterase levels after a few weeks of therapy.

Disease-related concerns:

- Asthma: Not generally recommended for use in patients with asthma.
- Cardiovascular disease: Not generally recommended for use in patients with bradycardia, hypotension or recent MI.
- GI disease: Not generally recommended for use in patients with GI disease, including peptic ulcer disease.
- Ocular: Appropriate use: Baseline measurement of anterior chamber angle recommended; routine lens examinations (for opacities) should be conducted. Do not use for tonometric glaucoma, or with active or history of uveitis, or retinal detachment. Use cautiously prior to ophthalmic surgery due to risk of blood in the anterior chamber.
- Parkinsonism: Not generally recommended for use in patients with parkinsonism.
- Seizure disorder: Not generally recommended for use in patients with a history of seizure disorder.
- Vagotonia: Not generally recommended for use in patients with vagotonia.

Concurrent drug therapy issues:

- Anticholinesterase agents: Use with caution in patients on concomitant anticholinesterase agents; warn patients of possible additive effects if chronically exposed to organophosphate/carbamate pesticides/insecticides.
- Succinylcholine: If general anesthesia required, use succinylcholine with great caution due to potential for respiratory or cardiovascular collapse.

Other warnings/precautions:

- Tolerance: Patients may develop tolerance after prolonged use; a rest period restores response to the drug.

Geriatric ConsiderationsAssess patient's ability to self-administer eye drops.
Pregnancy Risk FactorC
Pregnancy ConsiderationsAnimal reproductive studies have not been conducted. There are no adequate and well-controlled studies in pregnant women. Use only if clearly needed.
Adverse ReactionsFrequency not defined.

Cardiovascular: Bradycardia, cardiac irregularities, flushing, hypotension

Gastrointestinal: Diarrhea, nausea, vomiting

Neurologic & skeletal: Muscle weakness

Ocular: Blurred vision, browache, burning eyes, ciliary redness, conjunctival redness/thickening, intraocular pressure increases (paradoxical), iris cysts, lacrimation, lid muscle twitching, miosis, myopia, latent iritis or uveitis activation, lens opacities, retinal detachment, stinging

Respiratory: Dyspnea

Miscellaneous: Diaphoresis, nasolacrimal canal obstruction

Drug Interactions

Succinylcholine: Echothiophate Iodide may decrease the metabolism of Succinylcholine. *Risk D: Consider therapy modification*

Patient EducationBe sure of solution expiration date. Local irritation and headache may occur. Notify prescriber if abdominal cramps, diarrhea, or salivation occurs. Use caution if driving at night or performing hazardous tasks. Do not touch dropper to eye. Report any change in vision to prescriber. **Pregnancy precaution:** Inform prescriber if you are pregnant.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Powder for reconstitution, ophthalmic:

Phospholine Iodide®: 6.25 mg (5 mL) [0.125%; packaged with sterile diluent containing mannitol]

Generic AvailableNo
Pricing: U.S. (www.drugstore.com)

Injection (reconstituted) (Phospholine Iodide)

0.125% (5): $69.99

Mechanism of ActionLong-acting inhibition of cholinesterase enhances activity of endogenous acetylcholine. Reduced degradation of acetylcholine leads to continuous stimulation of the ciliary muscle producing miosis; other effects include potentiation of accommodation and facilitation of aqueous humor outflow, with attendant reduction in intraocular pressure.
Pharmacodynamics/Kinetics

Onset of action: Miosis: 10-30 minutes; Intraocular pressure decrease: 4-8 hours

Peak effect: Intraocular pressure decrease: 24 hours

Duration: Miosis: 1-4 weeks

International Brand NamesPhospholine Iodide (IL); Phospholine Jodide (HN); Phospholinjodid (AT)

English

Jump To Field (Select Field Name)

Pronunciation(e KONE a zole)
U.S. Brand NamesSpectazole® [DSC]
Pharmacologic CategoryAntifungal Agent, Topical
Use: Labeled IndicationsTopical treatment of tinea pedis (athlete's foot), tinea cruris (jock itch), tinea corporis (ringworm), tinea versicolor, and cutaneous candidiasis
Dosing: Adults

Tinea pedis: Apply sufficient amount to cover affected areas once daily for 1 month

Tinea cruris, tinea corporis, tinea versicolor: Apply sufficient amount to cover affected areas once daily for 2 weeks

Cutaneous candidiasis: Apply sufficient quantity twice daily (morning and evening) for 2 weeks

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricRefer to adult dosing.
Administration: TopicalOccasionally, longer treatment periods may be required. For external use only. Avoid contact with the eyes.
ContraindicationsHypersensitivity to econazole or any component of the formulation
Allergy Considerations

- Azole Antifungal Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Irritation: Discontinue if sensitivity or irritation occurs.

Other warnings/precautions:

- Appropriate use: For topical use only; avoid contact with eyes, mouth, nose, or other mucous membranes

Pregnancy Risk FactorC
Pregnancy ConsiderationsFetotoxic and embryotoxic events were observed in animal studies. The manufacturer does not recommend use during pregnancy.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions

1% to 10%: Dermatologic: Burning (3%), erythema (3%), itching (3%), stinging (3%)

Postmarketing and/or case reports: Pruritic rash

Metabolism/Transport Effects**Inhibits** CYP2E1 (weak)
Drug InteractionsThere are no known significant interactions.
Nursing: Physical Assessment/MonitoringAssess effectiveness at regular intervals, especially extended use. Teach patient appropriate application, possible side effects/appropriate interventions, and adverse symptoms to report.
Patient EducationThis mediation is for external use only; avoid contact with eyes, mouth, nose, or other mucous membranes. Apply in sufficient quantity to cover affected area as often as directed by prescriber. Do not cover with occlusive dressings or wrapping unless otherwise directed. Continue applications as long as directed even if area appears to be improved. May cause temporary burning, itching, or stinging. Report if these persist, if condition worsen or persists, or if infection occurs. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Cream, topical, as nitrate: 1% (15 g, 30 g, 85 g)

Spectazole®: 1% (15 g, 30 g, 85 g) [DSC]

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Cream (Econazole Nitrate)

1% (15): $14.99

1% (15): $15.99

1% (30): $26.99

1% (85): $49.99

Mechanism of ActionAlters fungal cell wall membrane permeability; may interfere with RNA and protein synthesis, and lipid metabolism

Pharmacodynamics/Kinetics

Absorption: <10%

Metabolism: Hepatic to more than 20 metabolites

Excretion: Urine (<1%); feces (<1%)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Eculizumab may be confused with efalizumab

Pronunciation(e kue LIZ oo mab)

U.S. Brand NamesSoliris™

Pharmacologic CategoryMonoclonal Antibody; Monoclonal Antibody, Complement Inhibitor

Use: Labeled IndicationsTreatment of paroxysmal nocturnal hemoglobinuria (PNH) to reduce hemolysis

Dosing: AdultsPNH: I.V.: 600 mg once weekly (±2 days) for 4 weeks, followed by 900 mg 1 week (±2 days) later; then maintenance: 900 mg every 2 weeks (±2 days) thereafter

Note: Patients must receive meningococcal vaccine at least 2 weeks prior to treatment initiation; revaccinate according to current guidelines.

Treatment should be administered at the recommended time interval, however, the administration day may be varied by ±2 days if serum LDH levels suggest increased hemolysis before the end of the dosing interval.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNot studied in renal dysfunction.

Dosing: Hepatic ImpairmentNot studied in hepatic dysfunction.

Administration: I.V.Allow to warm to room temperature prior to administration. Infuse over 35 minutes. Decrease infusion rate or discontinue for infusion reactions; do not exceed a maximum 2-hour duration of infusion. Monitor for at least 1 hour following completion of infusion.

Administration: I.V. DetailpH: 7

StoragePrior to dilution, store vials at 2°C to 8°C (36°F to 46°F). Protect from light; do not freeze; do not shake. Following dilution, store at room temperature or refrigerate; protect from light; use within 24 hours.

ReconstitutionDilute with an equal volume of D_5W, sodium chloride 0.9% sodium chloride 0.45%, or Ringer's injection to a final concentration of 5 mg/mL. (eg, 600 mg in a total volume of 120 mL or 900 mg in a total volume of 180 mL). Gently invert bag to mix.

Compatibility**Compatible** with D_5W, sodium chloride 0.9%, sodium chloride 0.45%, Ringer's injection

RestrictionsPatients and providers must enroll with Soliris™ OneSource™ (1-888-765-4747) prior to treatment initiation.

An FDA-approved medication guide is available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm; distribute to each patient to whom this medication is dispensed.

ContraindicationsHypersensitivity to eculizumab or any component of the formulation; unresolved serious *Neisseria meningitidis* infection; use in patients who have not received *Neisseria meningitidis* vaccination at least 2 weeks prior to first treatment

Warnings/Precautions

Boxed warnings:

- Meningococcal infection: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Infections: In addition to meningitis, the risk of other infections, especially with encapsulated bacteria (eg, *Streptococcus pneumoniae, H. influenzae*) is increased with eculizumab treatment.
- Infusion reactions: Infusion reactions, including anaphylaxis or hypersensitivity, may occur; interrupt infusion for severe reaction. Continue monitoring for 1 hour after completion of infusion.
- Meningococcal infection: **[U.S. Boxed Warning]: The risk for meningococcal*(Neisseria meningitides)*infections (septicemia and/or meningitis) is increased with PNH and may be further increased in patients receiving eculizumab; vaccinate with meningococcal vaccine at least 2 weeks prior to initiation of treatment;** revaccinate according to current guidelines. Quadravalent, conjugated meningococcal vaccines are recommended. Meningococcal infections developed in some patients despite vaccination. Monitor for early signs of meningococcal infections; evaluate and treat promptly. Consider withholding eculizumab during the treatment of serious meningococcal infections.

Disease-related concerns:

- Systemic infections: Use caution in patients with any concurrent systemic infection.

Concurrent drug therapy issues:

- Anticoagulation: In clinical trials, anticoagulant therapy was continued in patients who were receiving these agents prior to initiation of eculizumab. The effect of anticoagulant therapy withdrawal is unknown.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Discontinuation: Patients with PNH who discontinue eculizumab treatment may be at increased risk for serious hemolysis; monitor closely for at least 8 weeks after treatment discontinuation.

- Immunizations: Patients should be brought up to date with all immunizations before initiating therapy.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal studies have demonstrated fetal abnormalities. Human IgG is known to cross the placenta; therefore, eculizumab (a recombinant IgG molecule) may also. There are no adequate and well-controlled studies in pregnant women. Pregnant women with PNH and their fetuses have high rates of morbidity and mortality during pregnancy and the postpartum period. Use during pregnancy only if clearly needed.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsIt is not known if eculizumab is excreted in human milk. However, human IgG is excreted in breast milk, and therefore, eculizumab may also be excreted in milk. The risks to the infant from gastrointestinal or limited systemic exposure are unknown.

Adverse Reactions

>10%:

Central nervous system: Headache (2% to 44%), fatigue (12%)

Gastrointestinal: Nausea (16%)

Neuromuscular & skeletal: Back pain (19%)

Respiratory: Nasopharyngitis (23%), cough (12%)

1% to 10%:

Central nervous system: Fever (2%)

Gastrointestinal: Constipation (7%)

Hematologic: Anemia (2%)

Neuromuscular & skeletal: Limb pain (7%), myalgia (7%)

Respiratory: Respiratory tract infection (7%), sinusitis (7%)

Miscellaneous: Herpes infections (7%), flu-like syndrome (5%), viral infection (2%), meningococcal infection (1%)

<1%, postmarketing, and/or case reports: Chills, dizziness, infusion reaction, vomiting

Oncology: Emetic PotentialVery low (<10%)

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersSigns and symptoms of infusion reaction (during infusion and for 1 hour after infusion complete); CBC with differential, lactic dehydrogenase (LDH), AST, urinalysis

After discontinuation: Signs and symptoms of intravascular hemolysis, serum LDH (monitor for at least 8 weeks after discontinuation)

Nursing: Physical Assessment/MonitoringPatient should receive the meningococcal vaccine at least 2 weeks prior to starting therapy. Monitor closely during infusion and for 1hour post infusion. Monitor therapeutic response and adverse reactions at the beginning and periodically throughout therapy.

Monitoring: Lab TestsCBC with differential, lactic dehydrogenase (LDH), AST, urinalysis; after discontinuation, serum LDH (monitor for at least 8 weeks after discontinuation)

Patient EducationYou may experience headache, fatigue, nausea (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help), back pain, sore throat, cough, pain in extremities, muscle pain, nausea, or constipation. You may be at increased risk for meningitis. Menningococcal vaccination is recommended at least 2 weeks prior to starting therapy and repeated per clinical guidelines. Report immediately if you have a moderate-to-severe headache with nausea or vomiting, high fever, stiff neck or back, rash, confusion, severe muscle aches with flu-like symptoms, or eyes sensitive to light. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]:

Soliris™: 10 mg/mL (30 mL) [contains polysorbate 80]

Generic AvailableNo

ManufacturerAlexion Pharmaceuticals, Inc

Mechanism of ActionEculizumab is a humanized monoclonal IgG antibody that binds to complement protein C5, preventing cleavage into C5a and C5b. Blocking the formation of C5b inhibits the subsequent formation of terminal complex C5b-9 or membrane attack complex (MAC). Terminal complement-mediated intravascular hemolysis is a key clinical feature of paroxysmal nocturnal hemoglobinuria. Blocking the formation of MAC results in stabilization of hemoglobin and a reduction in the need for RBC transfusions.

Pharmacodynamics/Kinetics

Onset of action: PNH: Reduced hemolysis: ≤1 week

Distribution: 7.7 L

Half-life elimination: ~11 days (range: ~8-15 days)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause fatigue or dizziness

Mental Health: Effects on Psychiatric TreatmentNone reported

Edetate CALCIUM Disodium

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Special Alerts

Sound-Alike Look-Alike Issues - January, 2008

The U.S. Food and Drug Administration (FDA) has issued a public health advisory alerting healthcare professionals, patients, and caregivers about the possibility of serious outcomes that may result from the improper use of edetate disodium. Edetate disodium (Na$_2$EDTA) may be confused with edetate CALCIUM disodium (CaEDTA). Fatalities have been reported in children and adults who were inadvertently given edetate disodium instead of edetate CALCIUM disodium or when edetate disodium was used for “chelation therapy” and other non-FDA-approved uses. The FDA is currently evaluating the risk/benefit profile of edetate disodium; until further information is available, the following recommendations have been released by the FDA in attempt to reduce the risk of serious medication errors:

- Hospitals should evaluate the need to maintain stock of edetate disodium. If need for edetate disodium is **not** established, remove the entire supply from the pharmacy to reduce the risk of serious medication errors.
- Do **not** use edetate disodium or edetate CALCIUM disodium for unlabeled uses which have no proven benefit (eg, “chelation therapy” other than edetate CALCIUM disodium for lead poisoning, coronary artery disease, and autism).
- Patients with lead poisoning should **only** be treated with the edetate CALCIUM disodium form.
- Do **not** use the abbreviation “EDTA” when prescribing or dispensing either drug.
- Consider **always** including the indication for use on prescriptions for either drug.
- Hospitals, pharmacies, and healthcare providers should **always** double-check the diagnosis, prescription, and drug label at each step of dispensing and medication administration to ensure the correct medication is dispensed and administered to patients.

For more information, refer to the following FDA website: http://www.fda.gov/medwatch/safety/2008/safety08.htm#Edetate

Medication Safety Issues

Sound-alike look-alike issues:

To avoid potentially serious errors, the abbreviation “EDTA” should **never** be used.

Edetate CALCIUM disodium (CaEDTA) may be confused with edetate disodium (Na$_2$EDTA). CDC recommends that edetate disodium should **never** be used for chelation therapy in children. Fatal hypocalcemia may result if edetate disodium is used for chelation therapy instead of edetate calcium disodium. ISMP recommends confirming the diagnosis to help distinguish between the two drugs prior to dispensing and/or administering either drug.

Edetate CALCIUM disodium may be confused with etomidate

Pronunciation(ED e tate KAL see um dye SOW dee um)

U.S. Brand NamesCalcium Disodium Versenate®

Pharmacologic CategoryChelating Agent

Use: Labeled IndicationsTreatment of symptomatic acute and chronic lead poisoning or for symptomatic patients with high blood lead levels

Use: Unlabeled/InvestigationalPossibly useful in poisoning by zinc, manganese, and certain heavy radioisotopes

Dosing: Adults

Treatment of lead poisoning: In adults, available guidelines recommend chelation therapy with blood lead levels >50 mcg/dL and significant symptoms; chelation therapy may also be indicated with blood lead levels ≥100 mcg/dL and/or symptoms (Kosnett, 2007). Depending upon the blood lead level, additional courses may be necessary; repeat at least 2-4 days and preferably 2-4 weeks apart:

Asymptomatic lead poisoning with blood lead level >20 mcg/dL and <70 mcg/dL (manufacturer labeling): I.M., I.V.: 1000 mg/m^2/day (25-50 mg/kg/day) for 5 days. **Note:** the AAP recommends succimer as the drug used for initial management in asymptomatic children when blood lead levels are >45 mcg/dL and <70 mcg/dL. Edetate CALCIUM disodium can be used in children allergic to to succimer (AAP, 2005).

Symptomatic lead poisoning or blood lead levels ≥70 mcg/dL: I.M., I.V.: 1000 mg/m^2/day (25-50 mg/kg/day) for 5 days. Edetate CALCIUM disodium should be administered 4 hours after the initial dimercaprol dose. Edetate CALCIUM disodium should be used in conjunction with dimercaprol when blood lead levels are >70 mcg/dL or when symptoms of lead poisoning are present.

Lead encephalopathy: I.M., I.V.: 1500 mg/m^2/day (50-75 mg/kg/day). Edetate CALCIUM disodium should be administered 4 hours after the initial dimercaprol dose. Edetate CALCIUM disodium should be used in conjunction with dimercaprol when blood lead levels are >70 mcg/dL or when symptoms of lead poisoning are present.

Lead nephropathy: An alternative dosing regimen reflecting the reduction in renal clearance is based upon the serum creatinine. Dose of edetate CALCIUM disodium based on serum creatinine (Morgan, 1975): **Note:** Repeat regimen monthly until lead levels are reduced to an acceptable level:

S_{cr} >2-3 mg/dL / Cl_{cr} 30-50 mL/minute: Reduce recommended dose by 50% and administer daily

S_{cr} >3-4 mg/dL / Cl_{cr} 20-30 mL/minute: Reduce recommended dose by 50% and administer every 48 hours

S_{cr} >4 mg/dL / Cl_{cr} <20 mL/minute: Reduce recommended dose by 50% and administer once weekly

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Treatment of lead poisoning:** For the treatment of high blood lead levels in children, the CDC recommends chelation treatment when blood lead levels are >45 mcg/dL (CDC, 2002). Refer to adult dosing.

Dosing: Renal ImpairmentDose should be reduced with pre-existing mild renal disease. Limiting daily dose to 1 g in children and 2 g in adults may decrease risk of nephrotoxicity, although larger doses may be needed in the treatment of lead encephalopathy.

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics

Administration: I.M.For I.M. or I.V. use; I.V. is generally preferred, however, I.M. route is preferred when cerebral edema is present.

For I.M. injection: Daily dose should be divided into 2-3 equal doses spaced 8-12 hours apart. Procaine hydrochloride or lidocaine may be added to edetate CALCIUM disodium to minimize pain at injection site. Administer by deep I.M. injection. When used in conjunction with dimercaprol, inject in a separate site.

Administration: I.V.For I.M. or I.V. use; I.V. is generally preferred, however, I.M. route is preferred when cerebral edema is present.

I.V. infusion: Administer daily dose in diluted solution over 8-12 hours or continuously over 24 hours

StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F).

ReconstitutionFor I.V. infusion, dilute total daily dose into 250-500 mL of 0.9% sodium chloride or D_5W. Concentrations >0.5% (5 mg/mL) should be avoided. Procaine or lidocaine may be added to solutions given by I.M. injection.

CompatibilityStable in D_5W, NS; **incompatible** with $D_{10}W$, LR, Ringer's injection.

Compatibility when admixed: Incompatible: Amphotericin B, hydralazine.

Contraindications

Active renal disease or anuria; hepatitis

Allergy Considerations

- Bisphosphonate Allergy

Warnings/Precautions

Boxed warnings:

- Cerebral edema: See “Disease-related concerns” below.

Concerns related to adverse effects:

- Hypocalcemia: Fatal hypocalcemia may result if edetate disodium is used for the treatment of lead poisoning instead of edetate CALCIUM disodium.

- Nephrotoxicity: Edetate CALCIUM disodium is potentially nephrotoxic; renal tubular acidosis and fatal nephrosis may occur, especially with high doses; ECG changes may occur during therapy; do not exceed recommended daily dose. If anuria, increasing proteinuria, or hematuria occurs during therapy, discontinue edetate CALCIUM disodium. Minimize nephrotoxicity by adequate hydration, establishment of good urine output, avoidance of excessive doses, and limitation of continuous administration to ≤5 days.

Disease-related concerns:

- Cerebral edema: **[U.S. Boxed Warning]: Use with extreme caution in patients with lead encephalopathy and cerebral edema.** In these patients, I.V. infusion has been associated with lethal increase in intracranial pressure; I.M. injection is preferred.

- Lead poisoning: Investigate, identify, and remove sources of lead exposure prior to treatment. Primary care providers should consult experts in chemotherapy of lead toxicity before using chelation drug therapy.

- Renal impairment: Use with caution in patients with renal impairment; reduced dose recommended.

Other warnings/precautions:

- Potential for name confusion: Exercise caution in the ordering, dispensing, and administration of this drug. Edetate CALCIUM disodium (CaEDTA) may be confused with edetate disodium (Na_2EDTA). The CDC and FDA recommend that edetate disodium should never be used for chelation therapy (especially in children). Death has occurred following the use of edetate disodium for chelation therapy in pediatric patients with autism.

Pregnancy Risk FactorB
Pregnancy ConsiderationsAdverse events were observed in some animal reproduction studies; there are no well controlled studies of edetate CALCIUM disodium in pregnant women. Following maternal occupational exposure, lead was found to cross the placenta in amounts related to maternal plasma levels. Possible outcomes of maternal lead exposure >10 mcg/dL includes spontaneous abortion, postnatal developmental delay, and reduced birth weight. Chelation therapy during pregnancy is for maternal benefit only and should be limited to the treatment of severe, symptomatic lead poisoning.
LactationExcretion in breast milk unknown/use caution
Breast-Feeding Considerations

If present in breast milk, oral absorption of edetate CALCIUM disodium is poor (<5%) which would limit exposure to a nursing infant. However, edetate CALCIUM disodium is not used orally because it may increase lead absorption from the GI tract. The amount of lead in breast milk may range from 0.6% to 3% of the maternal serum concentration. Calcium supplementation may reduce the amount of lead in breast milk.

Adverse ReactionsFrequency not defined.

Cardiovascular: Arrhythmia, ECG changes, hypotension

Central nervous system: Chills, fatigue, fever, headache, malaise

Dermatologic: Cheilosis, dermatitis, rash

Endocrine & metabolic: Hypercalcemia

Gastrointestinal: Anorexia, GI upset, nausea, thirst (excessive), vomiting

Hematologic: Anemia, bone marrow suppression (transient)

Hepatic: Liver function test increased (mild)

Local: Thrombophlebitis following I.V. infusion (when concentration >5 mg/mL), pain at injection site following I.M. injection

Neuromuscular & skeletal: Arthralgia, myalgia, numbness, tremor

Ocular: Lacrimation

Renal: Glucosuria, nephrotoxicity, renal tubular necrosis, microscopic hematuria, proteinuria, urinary frequency/urgency

Respiratory: Nasal congestion, sneezing

Miscellaneous: Iron, magnesium, and/or zinc deficiency (with chronic therapy)

Drug Interactions

Insulin: Edetate CALCIUM Disodium may enhance the hypoglycemic effect of Insulin. *Risk C: Monitor therapy*

Test InteractionsIf edetate CALCIUM disodium is given as a continuous I.V. infusion, stop the infusion for at least 1 hour before blood is drawn for lead concentration to avoid a falsely elevated value
Monitoring ParametersUrinary output; ECG changes (with I.V. therapy); blood lead levels (baseline and 7-21 days after completing chelation therapy); hemoglobin or hematocrit, iron status, free erythrocyte protoporphyrin or zinc protoporphyrin; neurodevelopmental changes
Monitoring: Lab TestsBlood lead levels (baseline and 7-21 days after completing chelation therapy); hemoglobin or hematocrit, iron status, free erythrocyte protoporphyrin or zinc protoporphyrin
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: 200 mg/mL (5 mL)

Generic AvailableNo
Mechanism of ActionCalcium is displaced by divalent and trivalent heavy metals, forming a nonionizing soluble complex that is excreted in urine
Pharmacodynamics/Kinetics

Onset of action: Chelation of lead: I.V.: 1 hour

Absorption: I.M., SubQ: Well absorbed; Oral: <5%

Distribution: Into extracellular fluid; minimal CSF penetration (~5%)

Half-life elimination, plasma: 20-60 minutes

Excretion: Urine (as metal chelates or unchanged drug); decreased GFR decreases elimination

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentBest to avoid concomitant ziprasidone use due to ECG changes associated with therapy
Index TermsCaEDTA ; Calcium Disodium Edetate; Edetate Disodium CALCIUM; EDTA (CALCIUM Disodium) (error-prone abbreviation)

Sound-Alike Look-Alike Issues - January, 2008

The U.S. Food and Drug Administration (FDA) has issued a public health advisory alerting healthcare professionals, patients, and caregivers about the possibility of serious outcomes that may result from the improper use of edetate disodium. Edetate disodium (Na_2EDTA) may be confused with edetate CALCIUM disodium (CaEDTA). Fatalities have been reported in children and adults who were inadvertently given edetate disodium instead of edetate CALCIUM disodium or when edetate disodium was used for "chelation therapy" and other non-FDA-approved uses. The FDA is currently evaluating the risk/benefit profile of edetate disodium; until further information is available, the following recommendations have been released by the FDA in attempt to reduce the risk of serious medication errors:

- Hospitals should evaluate the need to maintain stock of edetate disodium. If need for edetate disodium is **not** established, remove the entire supply from the pharmacy to reduce the risk of serious medication errors.
- Do **not** use edetate disodium or edetate CALCIUM disodium for unlabeled uses which have no proven benefit (eg, "chelation therapy" other than edetate CALCIUM disodium for lead poisoning, coronary artery disease, and autism).
- Patients with lead poisoning should **only** be treated with the edetate CALCIUM disodium form.
- Do **not** use the abbreviation "EDTA" when prescribing or dispensing either drug.
- Consider **always** including the indication for use on prescriptions for either drug.
- Hospitals, pharmacies, and healthcare providers should **always** double-check the diagnosis, prescription, and drug label at each step of dispensing and medication administration to ensure the correct medication is dispensed and administered to patients.

For more information, refer to the following FDA website: http://www.fda.gov/medwatch/safety/2008/safety08.htm#Edetate

Medication Safety Issues

Sound-alike look-alike issues:

To avoid potentially serious errors, the abbreviation "EDTA" should **never** be used.

Edetate disodium (Na_2EDTA) may be confused with edetate calcium disodium (CaEDTA). CDC recommends that edetate disodium should **never** be used for chelation therapy in children. Fatal hypocalcemia may result if edetate disodium is used for chelation therapy instead of edetate calcium disodium. ISMP recommends confirming the diagnosis to help distinguish between the two drugs prior to dispensing and/or administering either drug.

Edetate disodium may be confused with etomidate

Pronunciation(ED e tate dye SOW dee um)

U.S. Brand NamesEndrate® [DSC]

Pharmacologic CategoryChelating Agent

Use: Labeled IndicationsEmergency treatment of hypercalcemia in adults

Use: Unlabeled/InvestigationalEmergency treatment of hypercalcemia in children

Dosing: Adults**Note:** Confirm the diagnosis prior to dispensing.

Hypercalcemia: I.V.: 50 mg/kg/day over 3 or more hours to a maximum of 3 g/24 hours; a suggested regimen of 5 days followed by 2 days without drug and repeated courses up to 15 total doses

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** Confirm the diagnosis prior to dispensing.

Hypercalcemia (unlabeled use): I.V.: 40-70 mg/kg/day slow infusion over 3-4 hours or more to a maximum of 3 g/24 hours; administer for 5 days and allow 5 days between courses of therapy.

Administration: I.M.Not for I.M. use

Administration: I.V.Must be diluted before I.V. use in D_5W or NS to a maximum concentration of 30 mg/mL (3%) and infused over at least 3 hours; avoid extravasation

Dietary ConsiderationsSodium content of 1 g: 5.4 mEq

CompatibilityStable in dextran 6% in dextrose, dextran 6% in NS, $D_5{}^1/_4$NS, $D_5{}^1/_2$NS, D_5NS, D_5W, D_{10}W, D_{10}NS, ${}^1/_2$NS, NS.
ContraindicationsHypersensitivity to edetate disodium or any component of the formulation; severe renal disease or anuria
Allergy Considerations

- Bisphosphonate Allergy

Warnings/Precautions

Boxed warnings:

- Appropriate use: See “Other warnings/precautions” below.

Concerns related to adverse effects:

- Hypocalcemia: Fatal hypocalcemia may result if edetate disodium is used for the treatment of lead poisoning instead of edetate CALCIUM disodium.

Disease-related concerns:

- Diabetes: Use with caution in patients with diabetes mellitus; may decrease blood glucose.
- Hypokalemia: Use with caution in patients with hypokalemia; monitor closely.
- Intracranial lesions: Use with caution in patients with intracranial lesions.
- Renal impairment: Use with caution in patients with renal impairment.
- Seizures: Use with caution in patients with a history of seizure disorder.
- Vascular disease: Not recommended for the treatment of atherosclerotic cardiovascular disease; no evidence of a beneficial effect with chelation therapy.

Special populations:

- Pediatrics: Safety and efficacy have not been established in pediatric patients. The CDC and FDA recommend that edetate disodium should never be used for chelation therapy in children. Death has occurred following the use of edetate disodium for chelation therapy in pediatric patients with autism.

Other warnings/precautions:

- Appropriate use: **[U.S. Boxed Warning]: Use of this drug is recommended only when the severity of the clinical condition justifies the aggressive measures associated with this type of therapy.**
- Potential for name confusion: Exercise caution in the ordering, dispensing, and administration of this drug. Edetate disodium (Na_2EDTA) may be confused with edetate CALCIUM disodium (CaEDTA). The CDC and FDA recommend that edetate disodium should never be used for chelation therapy (especially in children).
- Infusion reactions: Rapid I.V. administration or excessive doses may cause a sudden drop in serum calcium concentration which may lead to hypocalcemic tetany, seizure, arrhythmia, and death from respiratory arrest. Do not exceed recommended dosage and rate of administration.

Pregnancy Risk FactorC
Adverse ReactionsFrequency not always defined.

Gastrointestinal: Nausea, vomiting, abdominal cramps, diarrhea

<1%: Arrhythmias, transient hypotension, acute tubular necrosis, seizure, fever, headache, tetany, chills, eruptions, dermatologic lesions, hypomagnesemia, hypokalemia, anemia, thrombophlebitis, pain at the site of injection, paresthesia, back pain, muscle cramps, nephrotoxicity, death from respiratory arrest

Drug Interactions

Insulin: Edetate Disodium may enhance the hypoglycemic effect of Insulin. *Risk C: Monitor therapy*

Monitoring ParametersECG monitoring; blood pressure during infusion; renal function should be assessed before and during therapy; monitor calcium, magnesium, and potassium levels
Monitoring: Lab TestsCalcium, magnesium, and potassium levels
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Injection, solution: 150 mg/mL (20 mL)

Endrate®: 150 mg/mL (20 mL) [DSC]

Generic AvailableYes
Mechanism of ActionChelates with divalent or trivalent metals to form a soluble complex that is then eliminated in urine
Pharmacodynamics/Kinetics

Metabolism: None

Half-life elimination: 20-60 minutes

Time to peak: I.V.: 24-48 hours

Excretion: Following chelation: Urine (95%); chelates within 24-48 hours

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsEdathamil Disodium; EDTA (Disodium) (error-prone abbreviation); Na_2EDTA; Sodium Edetate

International Brand NamesOpti-Free Express (MX)

Edrophonium and Atropine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(ed roe FOE nee um & A troe peen)
U.S. Brand NamesEnlon-Plus™ [DSC]
Pharmacologic CategoryAnticholinergic Agent; Antidote; Cholinergic Agonist
Use: Labeled IndicationsReversal of nondepolarizing neuromuscular blockers; adjunct treatment of respiratory depression caused by curare overdose
Dosing: AdultsReversal of neuromuscular blockade: I.V.: 0.05 mL/kg given over 45-60 seconds. The dose delivered is 0.5-1 mg/kg of edrophonium and 0.007-0.015 mg/kg of atropine. An edrophonium dose of 1 mg/kg should rarely be exceeded. **Note:** Monitor closely for bradyarrhythmias. Have atropine on hand in case needed.
Dosing: ElderlyRefer to adult dosing.
Dosing: Renal ImpairmentAdjustment not required.
Dosing: Hepatic ImpairmentAdjustment not required.
Administration: I.V. DetailpH: 4-5
StorageStore at 15°C to 26°C (59°F to 78°F).
ContraindicationsHypersensitivity to edrophonium, atropine, sulfites, or any component of the formulation; GI or GU obstruction. Atropine is contraindicated in acute glaucoma, adhesions (synechiae) between the iris and the lens of the eye, and pyloric stenosis.
Allergy Considerations

- Belladonna Alkaloid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anticholinesterase insensitivity: if patient becomes insensitive to the drug, reduce dose or discontinue edrophonium until patient sensitive again.
- Respiratory arrest: Rare reports of respiratory arrest have occurred with edrophonium.
- Tissue irritation: May cause tissue irritation if extravasated.

Disease-related concerns:

- Arrhythmias: Use with caution in patients with cardiac arrhythmias (eg, bradyarrhythmias).
- Asthma: Use with caution in patients with bronchial asthma.
- Chronic lung disease: Use with caution in patients with chronic lung disease.
- Prostatic hyperplasia: Use with caution in patients with prostatic hyperplasia.
- Myasthenia gravis: Avoid use in myasthenia gravis; may exacerbate muscular weakness.

Concurrent drug therapy issues:

- Anticholinergics: Consider additive adverse effects with concurrent use of atropine and other anticholinergics (eg, tricyclic antidepressants, antipsychotics, some antihistamines, anti-Parkinson drugs).
- Atropine: Patients who are bradycardic or at risk of being bradycardic (eg, those on a beta-blocker or cardiovascular patients who received anesthesia with a narcotic and nitrous oxide only) should first receive atropine prior to edrophonium-atropine combination. Most arrhythmias occur within 2 minutes of administration and reverse shortly thereafter. Atropine should be available for immediate use in case of severe cholinergic reaction. Bradyarrhythmias respond to small doses of atropine.
- Nondepolarizing muscle relaxants: Should not be administered before any nondepolarizing muscle relaxant.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Sodium sulfite: Products may contain sodium sulfite.

Geriatric ConsiderationsNot enough elderly patients were included in clinical trials to determine differences in response from younger adults. Initiate dose at the lower end of the dosing range.
Pregnancy Risk FactorC
Pregnancy ConsiderationsSee Atropine monograph.
Breast-Feeding ConsiderationsSee Atropine monograph.

Adverse ReactionsAlso see individual agents.

>10%: Cardiovascular: Bradycardia, junctional rhythm, tachycardia

1% to 10%: Cardiovascular: Atrial premature contractions (3% to 10%), first-degree AV block (3% to 10%), P-wave changes (3% to 10%), second-degree AV block (3% to 10%), third-degree AV block (1% to 3%), premature ventricular contractions (1% to 3%)

Drug Interactions

Acetylcholinesterase Inhibitors: May enhance the adverse/toxic effect of Cholinergic Agonists. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Cannabinoids: Anticholinergic Agents may enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

Potassium Chloride: Anticholinergic Agents may enhance the ulcerogenic effect of Potassium Chloride. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Secretin: Anticholinergic Agents may diminish the stimulatory effect of Secretin. *Risk D: Consider therapy modification*

Monitoring ParametersVital signs, ECG, and ventilatory support; neuromuscular function
Nursing: Physical Assessment/MonitoringSee individual agents.
Patient EducationSee individual agents.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Injection, solution:

Enlon-Plus™: Edrophonium chloride 10 mg/mL and atropine sulfate 0.14 mg/mL (5 mL, 15 mL) [contains sodium sulfite] [DSC]

Generic AvailableNo
ManufacturerBaxter
Mechanism of Action

Edrophonium: Inhibits destruction of acetylcholine by acetylcholinesterase. This facilitates transmission of impulses across myoneural junction and results in increased cholinergic response.

Atropine: Minimizes or prevents the muscarinic cholinergic effects caused by edrophonium (eg, bradycardia, bronchocontriction, and increased secretions).

Pharmacodynamics/KineticsSee individual agents.

Onset of action: Edrophonium: Antagonism of nondepolarizing muscle relaxants: 3 minutes; Atropine: Heart rate: Immediate

Duration: Edrophonium: Antagonism of nondepolarizing muscle relaxants: 70 minutes; Atropine: Heart rate: 170 minutes

Protein binding: Atropine: 14%

Half-life elimination: Edrophonium: Adults: 1.2-2.4 hours; Anephric patients: 2.4-4.4 hours

Time to peak, plasma: Edrophonium: Antagonism of nondepolarizing muscle relaxants: 1.2 minutes; Atropine: Heart rate: 2-16 minutes

Excretion: Edrophonium: Primarily urine (67%)

Related Information

- Atropine
- Edrophonium

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsBradyarrhythmias, tachycardia, and premature ventricular contractions have been reported; use vasoconstrictor with caution
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentAtropine is highly anticholinergic; concurrent use of atropine and other anticholinergics (eg, tricyclic antidepressants, antipsychotics, some antihistamines, antiparkinson drugs) may produce additive effects. Avoid use in myasthenia gravis; myasthenic weakness may be a symptom of anticholinesterase overdose. Concomitant use with propranolol may produce additive bradycardia.
Index TermsAtropine Sulfate and Edrophonium Chloride; Edrophonium Chloride and Atropine Sulfate

---

Edrophonium

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(ed roe FOE nee um)
U.S. Brand NamesEnlon® [DSC]
Canadian Brand NamesEnlon®; Tensilon®
Pharmacologic CategoryAntidote; Cholinergic Agonist; Diagnostic Agent
Use: Labeled IndicationsDiagnosis of myasthenia gravis; differentiation of cholinergic crises from myasthenia crises; reversal of nondepolarizing neuromuscular blockers; adjunct treatment of respiratory depression caused by curare overdose
Dosing: AdultsUsually administered I.V., however, if not possible, I.M. or SubQ may be used.

Diagnosis of Myasthenia gravis:

I.V.: 2 mg test dose administered over 15-30 seconds; 8 mg given 45 seconds later if no response is seen. Test dose may be repeated after 30 minutes.

I.M.: Initial: 10 mg; if no cholinergic reaction occurs, give 2 mg 30 minutes later to rule out false-negative reaction.

Titration of oral anticholinesterase therapy: 1-2 mg given 1 hour after oral dose of anticholinesterase; if strength improves, an increase in neostigmine or pyridostigmine dose is indicated.

Differentiation of cholinergic from myasthenic crisis: I.V.: 1 mg; may repeat after 1 minute. **Note:** Intubation and controlled ventilation may be required if patient has cholinergic crisis.

Reversal of nondepolarizing neuromuscular blocking agents (neostigmine with atropine usually preferred): I.V.: 10 mg over 30-45 seconds; may repeat every 5-10 minutes up to 40 mg.

Termination of paroxysmal atrial tachycardia: I.V. rapid injection: 5-10 mg

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricUsually administered I.V., however, if not possible, I.M. or SubQ may be used:

Infants:

I.M.: 0.5-1 mg

I.V.: Initial: 0.1 mg, followed by 0.4 mg if no response; total dose = 0.5 mg

Children:

Diagnosis: Initial: 0.04 mg/kg over 1 minute followed by 0.16 mg/kg if no response, to a maximum total dose of 5 mg for children <34 kg, or 10 mg for children >34 kg **or**

Alternative dosing (manufacturer's recommendation):

≤34 kg: 1 mg; if no response after 45 seconds, repeat dosage in 1 mg increments every 30-45 seconds, up to a total of 5 mg

>34 kg: 2 mg; if no response after 45 seconds, repeat dosage in 1 mg increments every 30-45 seconds, up to a total of 10 mg

I.M.:

<34 kg: 1 mg

>34 kg: 5 mg

Titration of oral anticholinesterase therapy: 0.04 mg/kg once given 1 hour after oral intake of the drug being used in treatment. If strength improves, an increase in neostigmine or pyridostigmine dose is indicated.

Dosing: Renal ImpairmentDose may need to be reduced in patients with chronic renal failure.
Administration: I.V. DetailpH: 5.4
Compatibility**Y-site administration: Compatible:** Heparin, hydrocortisone sodium succinate, potassium chloride, vitamin B complex with C.
ContraindicationsHypersensitivity to edrophonium, sulfites, or any component of the formulation; GI or GU obstruction
Warnings/Precautions

Concerns related to adverse effects:

- Cholinergic crisis: Overdosage can cause cholinergic crisis which may be fatal. Atropine should always be readily available as an antagonist and for treatment of cholinergic reactions.

Disease-related concerns:

- Arrhythmias: Use with caution in patients with cardiac arrhythmias (eg, bradyarrhythmias).
- Asthma: Use with caution in patients with bronchial asthma.
- Myasthenia gravis: Avoid use in myasthenia gravis; may exacerbate muscular weakness.

Concurrent drug therapy issues:

- Cardiac glycosides: Use with caution in patients receiving a cardiac glycoside; may enhance AV block.

Dosage form specific issues:

- Sodium sulfite: Products may contain sodium sulfite.

Geriatric ConsiderationsMany elderly will have diseases which may influence the use of edrophonium. Also, many elderly will need doses reduced 50% due to creatinine clearances in the 10-50 mL/minute range (common in the aged). Side effects or concomitant disease may warrant use of pyridostigmine.

Pregnancy Risk FactorC

LactationExcretion in breast milk unknown

Adverse ReactionsFrequency not defined.

Cardiovascular: Arrhythmias (especially bradycardia), AV block, cardiac arrest, decreased carbon monoxide, flushing, hypotension, nodal rhythm, nonspecific ECG changes, syncope, tachycardia

Central nervous system: Convulsions, dizziness, drowsiness, dysarthria, dysphonia, headache, loss of consciousness

Dermatologic: Skin rash, thrombophlebitis (I.V.), urticaria

Gastrointestinal: Diarrhea, dysphagia, flatulence, hyperperistalsis, nausea, salivation, stomach cramps, vomiting

Genitourinary: Urinary urgency

Neuromuscular & skeletal: Arthralgias, fasciculations, muscle cramps, spasms, weakness

Ocular: Lacrimation, small pupils

Respiratory: Bronchiolar constriction, bronchospasm, dyspnea, bronchial secretions increased, laryngospasm, respiratory arrest, respiratory depression, respiratory muscle paralysis

Miscellaneous: Allergic reactions, anaphylaxis, diaphoresis increased

Drug Interactions

Acetylcholinesterase Inhibitors: May enhance the adverse/toxic effect of Cholinergic Agonists. *Risk C: Monitor therapy*

Test InteractionsIncreased aminotransferase [ALT/AST] (S), amylase (S)

Monitoring ParametersPre- and postinjection strength (cranial musculature is most useful); heart rate, respiratory rate, blood pressure

Nursing: Physical Assessment/MonitoringAdministration of edrophonium for MG diagnosis is supervised by a neurologist and use as a neuromuscular blocking agent is supervised by an anesthesiologist. Patient must be monitored closely during and following procedure, especially for cholinergic crisis; keep atropine at hand for antidote. Patients receiving the medication for MG testing will have been advised by their neurologist about drug effects. Those patients receiving medication for neuromuscular block will be unaware of drug effects. Patient should never be left alone until all drug effects and the possibility of cholinergic crisis have passed.

Patient Education**Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as chloride:

Enlon®: 10 mg/mL (15 mL) [contains sodium sulfite]

Generic AvailableNo

Mechanism of ActionInhibits destruction of acetylcholine by acetylcholinesterase. This facilitates transmission of impulses across myoneural junction and results in increased cholinergic responses such as miosis, increased tonus of intestinal and skeletal muscles, bronchial and ureteral constriction, bradycardia, and increased salivary and sweat gland secretions.

Pharmacodynamics/Kinetics

Onset of action: I.M.: 2-10 minutes; I.V.: 30-60 seconds

Duration: I.M.: 5-30 minutes: I.V.: 10 minutes

Distribution: V_d: Adults: 1.1 L/kg

Half-life elimination: Adults: 1.2-2.4 hours; Anephric patients: 2.4-4.4 hours

Excretion: Adults: Primarily urine (67%)

Pharmacotherapy PearlsAtropine should be administered along with edrophonium when reversing the effects of nondepolarizing agents to antagonize the cholinergic effects at the muscarinic receptors, especially bradycardia. It is important to recognize the difference in dose for diagnosis of myasthenia gravis versus reversal of muscle relaxant, a much larger dose is needed for desired effect of reversal of muscle paralysis.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness

Mental Health: Effects on Psychiatric TreatmentNone reported

Anesthesia and Critical Care Concerns/Other ConsiderationsAtropine should be administered along with edrophonium when reversing the effects of nondepolarizing agents to antagonize the cholinergic effects at the muscarinic receptors, especially bradycardia; important to recognize the difference in dose for diagnosis of myasthenia gravis versus reversal of muscle relaxant, a much larger dose is needed for desired effect of reversal of muscle paralysis

Efalizumab

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Special Alerts

Efalizumab: New Boxed Warnings (Associated With Life-threatening Infections, Including Progressive Multifocal Leukoencephalopathy) - October 20, 2008

The Food and Drug Administration (FDA) has informed healthcare professionals regarding the addition of black boxed warnings to the efalizumab prescribing information related to the development of progressive multifocal leukoencephalopathy (PML) and other life-threatening infections (bacterial, viral, fungal and other opportunistic infections).

Prior to this labeling change, Genentech, Inc issued a “Dear Healthcare Professional” letter informing of a case of PML, reported in a patient who had received efalizumab (for >4 years) for the treatment of plaque psoriasis. This patient was not receiving other immunosuppressants. PML is a demyelinating central nervous system disease due to latent JC virus. Any neurological change in patients receiving efalizumab should be evaluated promptly; if clinically indicated, consider neurology consultation, brain MRI and lumbar puncture for suspected PML. Discontinue efalizumab in patients who develop PML.

Labeling changes also include addition of data from juvenile murine studies, which suggests a risk for permanent immunosuppression in association with repeat efalizumab administration in children. Efalizumab is not approved for use in patients under the age of 18 years.

A medication guide regarding these safety concerns will be available in the near future.

For more information, see:

http://www.fda.gov/medwatch/safety/2008/safety08.htm#Raptiva

http://www.gene.com/gene/products/information/pdf/raptiva_dhcp.pdf

Medication Safety Issues

Sound-alike/look-alike issues:

Efalizumab may be confused with eculizumab

Raptiva® maybe confused with Rapaflo®

Pronunciation(e fa li ZOO mab)

U.S. Brand NamesRaptiva®

Pharmacologic CategoryImmunosuppressant Agent; Monoclonal Antibody

Use: Labeled IndicationsTreatment of chronic moderate-to-severe plaque psoriasis in patients who are candidates for systemic therapy or phototherapy

Dosing: AdultsPsoriasis: SubQ: Initial: 0.7 mg/kg, followed by weekly dose of 1 mg/kg (maximum: 200 mg/dose)

Dosing: ElderlyRefer to adult dosing.

Administration: OtherFor SubQ injection in the abdomen, buttocks, thigh, or upper arm. Rotate injection sites.

StoragePowder should be stored under refrigeration at 2°C to 8°C (36°F to 46°F) and protected from light. Following reconstitution, solution should be stored at room temperature and used within 8 hours. Discard unused solution.

ReconstitutionSlowly inject 1.3 mL of the provided diluent into vial. Gently swirl to mix; do not shake.

ContraindicationsHypersensitivity to efalizumab or any component of the formulation

Warnings/Precautions

Boxed warnings:

- Infections: See “Concerns related to adverse effects” below.
- Progressive multifocal leukoencephalopathy: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- First dose reactions: Have been reported; a lower, conditioning dose is recommended to reduce the incidence and severity of reactions.
- Hemolytic anemia: May occur after 4-6 months of treatment, has been reported; discontinue if signs and symptoms of hemolytic anemia

occur.

- Infections: **[U.S. Boxed Warning]: Infections (bacterial, viral, fungal and other opportunistic infections), some serious and even fatal, have been reported with efalizumab use.** May result in increased susceptibility to infections or reactivation of latent infection; use caution with chronic infections, history of recurrent infection, or the elderly. Avoid administration to patients with clinically important infection; discontinue therapy if serious infection develops.

- Neurologic events: Neurologic events (including chronic inflammatory demyelinating polyneuropathy, facial palsy, Guillain-Barré syndrome, and transverse myelitis) have been observed; discontinue therapy if signs of a neurologic event occurs.

- Progressive multifocal leukoencephalopathy (PML): **[U.S. Boxed Warning]: Progressive multifocal leukoencephalopathy (PML), a demyelinating central nervous system disease due to latent JC virus infection, has been reported with efalizumab use.** Evaluate any neurological change promptly; if clinically indicated, consider neurology consultation, brain MRI, and lumbar puncture for suspected PML. Discontinue efalizumab in patients who develop PML.

- Thrombocytopenia: Has been reported (rare) and may require treatment; discontinue if thrombocytopenia develops.

Disease-related concerns:

- Hepatic impairment: Safety and efficacy have not been established in patients with hepatic impairment.

- Malignancy: Use with caution in patients at high risk for malignancy or history of malignancy; effects of efalizumab on the development of malignancies is unknown.

- Renal impairment: Safety and efficacy have not been established in patients with renal impairment.

Concurrent drug therapy issues:

- Immunosuppressants: Concomitant use with other immunosuppressant agents is not recommended.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Hamster cell: Produced in a Chinese hamster cell medium.

- Immunizations: Patients should be brought up to date with all immunizations before initiating therapy. Live vaccines should not be given concurrently; there is no data available concerning secondary transmission of live vaccines in patients receiving therapy. Inactivated immunizations may not elicit adequate response to prevent disease.

- Worsening of condition: Psoriasis and/or arthritis may worsen with treatment or following discontinuation (rare).

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted. A decreased ability to mount an antibody response was observed in the offspring of female mice who received efalizumab during toxicity studies. There are no adequate and well-controlled studies in pregnant women. Healthcare providers are encouraged to enroll patients who may become pregnant during therapy or within 6 weeks of discontinuing treatment in the Raptiva® registry (877-727-8482).

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsA decrease in the ability to mount an antibody response was observed in the offspring of lactating mice. It is not known if efalizumab is excreted in human milk. However, since maternal immunoglobulins are present, and animal data suggest possible adverse effects in the nursing infant, it is recommended to discontinue nursing or discontinue efalizumab.

Adverse Reactions

>10%:

Central nervous system: Headache (32%), chills (13%)

Gastrointestinal: Nausea (11%)

Hematologic: Lymphocytosis (40%), leukocytosis (26%)

Miscellaneous: First-dose reaction (29%, described as chills, fever, headache, myalgia, and nausea occurring within 2 days of the first injection; percent reported in patients receiving a 1 mg/kg dose; severity decreased with 0.7 mg/kg dose); infection (29%, serious infection <1%)

1% to 10%:

Cardiovascular: Peripheral edema (1% to 2%)

Central nervous system: Pain (10%), fever (7%)

Dermatologic: Acne (4%), psoriasis (1% to 2%), urticaria (1%)

Hepatic: Alkaline phosphatase increased (4%)

Neuromuscular & skeletal: Myalgia (8%), back pain (4%), arthralgia (1% to 2%), weakness (1% to 2%)

Miscellaneous: Antibodies to efalizumab (6%); hypersensitivity reaction, including asthma, dyspnea, angioedema, urticaria, or maculopapular rash (8%); flu-like syndrome (7%)

<1%, postmarketing and/or case reports: Arthritis, aseptic meningitis, asthma, bacterial sepsis (with seeding of distant sites), bronchiolitis obliterans, chronic inflammatory demyelinating polyneuropathy, drug eruption (allergic), erythema multiforme, facial palsy, fungal infection, Guillain-Barré syndrome, hemolytic anemia (immune mediated), inflammatory arthritis, idiopathic hepatitis, interstitial pneumonitis, laryngospasm, lymphoma, malignancies, necrotizing fasciitis, opportunistic infection, photoallergic dermatitis, photosensitivity, pneumonia (severe with neutropenia), progressive multifocal leukoencephalopathy (PML), serious psoriasis events (include erythrodermic, guttate, and pustular subtypes); psoriatic arthritis, serum sickness-like reaction, sialadenitis, sensorineural hearing loss, thrombocytopenia (immune mediated), toxic epidermal necrolysis, transverse myelitis, tuberculous pneumonia, viral infection

Drug Interactions

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Test InteractionsIncreased lymphocytes (related to mechanism of action)

Monitoring ParametersPlatelet counts (at least monthly at the start of treatment, every 3 months as therapy continues); signs of infection; worsening of psoriasis; any neurologic impairment

Signs or symptoms of progressive multifocal leukoencephalopathy (focal neurologic deficits, which may present as hemiparesis, visual field deficits, cognitive impairment, aphasia, ataxia, and/or cranial nerve deficits); if PML is suspected, obtain brain MRI scan and lumbar puncture

Nursing: Physical Assessment/MonitoringAssess results of laboratory tests. Be alert to the possibility of the development of infection or malignancy. Assess therapeutic effectiveness and adverse reactions on a regular basis throughout therapy. Do not administer any immunizations with acellular, live, or live-attenuated vaccines during therapy with efalizumab. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsPlatelet counts (at least monthly at the start of treatment, every 3 months as therapy continues)

Patient EducationThis medication can only be given by injection. Do not take any new medications during therapy without consulting prescriber. You may be more susceptible to infection while on this therapy; avoid crowds and exposure to infections, and do not have any immunizations while on this therapy. Notify prescriber of any allergic response (headache, chills, muscle pain, rash, difficulty breathing, or swelling around mouth within 3 days of first dose). May cause mild edema in extremities; back or muscle pain or flu-like syndrome (consult prescriber for appropriate analgesic). Report unusual infection or bleeding; weight gain >5 pounds in 1 week; persistent muscle or joint pain or weakness; other persistent reactions or worsening of psoriasis. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to be pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Raptiva®: 150 mg [contains sucrose 123.2 mg/vial; delivers 125 mg/1.25 mL; packaged with prefilled syringe containing sterile water for injection]

Generic AvailableNo

ManufacturerGenentech, Inc

Mechanism of ActionEfalizumab is a recombinant monoclonal antibody which binds to CD11a, a subunit of leukocyte function antigen-1 (LFA-1) found on leukocytes. By binding to CD11a, efalizumab blocks multiple T-cell mediated responses involved in the pathogenesis of psoriatic plaques.

Pharmacodynamics/Kinetics

Onset: Reduction of CD11a expression and free CD11a-binding sites seen 1-2 days after the first dose; time to steady state serum concentration: 4 weeks

Response to therapy (75% reduction from baseline of PASI score): Observed after 12 weeks

Duration: CD11a expression was ~74% of baseline at 5-13 weeks after discontinuing dose; free CD11a binding sites were at ~86% of baseline at 8-13 weeks following discontinuation; response to therapy (75% reduction from baseline PASI score) continued 1-2 months after discontinuation

Bioavailability: SubQ: 50%

Excretion: Time to eliminate (at steady state): 25 days (range: 13-35 days)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause sedation

Mental Health: Effects on Psychiatric TreatmentNausea is common; concurrent use with SSRIs and/or valproic acid may produce additive effects. May cause acne or psoriasis; lithium may produce similar side effects; monitor. Flu-like syndrome has been reported and may present similarly to SSRI-discontinuation symptoms. May rarely cause thrombocytopenia; monitor with high-dose valproic acid use.

Index TermsAnti-CD11a; hu1124

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(e FAV e renz, em trye SYE ta been, & te NOE fo veer)

U.S. Brand NamesAtripla®

Canadian Brand NamesAtripla®

Pharmacologic CategoryAntiretroviral Agent, Reverse Transcriptase Inhibitor (Non-nucleoside); Antiretroviral Agent, Reverse Transcriptase Inhibitor (Nucleoside); Antiretroviral Agent, Reverse Transcriptase Inhibitor (Nucleotide)

Use: Labeled IndicationsTreatment of HIV infection

Dosing: AdultsHIV infection: Oral: One tablet once daily

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentModerate-to-severe renal impairment (Cl_{cr} <50 mL/minute): Use not recommended.

Calculations

- Creatinine Clearance: Adults

Administration: OralShould be taken on an empty stomach, normally at bedtime to increase gastrointestinal tolerance and decrease nervous system manifestations.

Dietary ConsiderationsShould be taken on an empty stomach. In patients with history of bone fracture or osteopenia, consider calcium and vitamin D supplementation.

StorageStore 15°C to 30°C (59°F to 86°F). Dispense only in original container.

ContraindicationsHypersensitivity to efavirenz, emtricitabine, or tenofovir, or any component of the formulation; concurrent use of cisapride, midazolam, triazolam, voriconazole, ergot alkaloids (includes dihydroergotamine, ergotamine, ergonovine, methylergonovine), St John's wort, pimozide; concurrent use of other tenofovir-, efavirenz-, or lamivudine-containing formulations

Warnings/Precautions

Boxed warnings:

- Chronic hepatitis B: See “Disease-related concerns” below.
- Lactic acidosis/hepatomegaly: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- CNS depression: May cause CNS depression (eg, impaired concentration, dizziness or drowsiness); avoid potentially hazardous tasks such as driving or operating machinery.
- Decreased bone mineral density: Use has been associated with decreases in bone mineral density (~5% to 7%) and osteomalacia. Consider monitoring of bone density in patients at risk for osteopenia or with a history of pathologic fractures; consider calcium and vitamin D supplementation.
- Fat redistribution: May cause redistribution of fat (eg, buffalo hump, peripheral wasting with increased abdominal girth, cushingoid appearance).
- Immune reconstitution syndrome: Patients may develop immune reconstitution syndrome resulting in the occurrence of an inflammatory response to an indolent or residual opportunistic infection; further evaluation and treatment may be required.
- Lactic acidosis/hepatomegaly: **[U.S Boxed Warning]: Lactic acidosis and severe hepatomegaly with steatosis have been reported with nucleoside analogues, including fatal cases;** use with caution in patients with risk factors for liver disease (risk may be increased with female gender, obesity, pregnancy or prolonged exposure) and suspend treatment in any patient who develops clinical or laboratory findings suggestive of lactic acidosis or hepatotoxicity (transaminase elevation may/may not accompany hepatomegaly and steatosis). Persistent elevations of serum transaminases >5 times the upper limit of normal should prompt evaluation - benefit of continued therapy should be weighed against possible risk of hepatotoxicity.
- Psychiatric effects: Serious psychiatric side effects have been associated with use, including severe depression, suicide, paranoia, and mania; use with caution in patients with a history of mental illness/drug abuse (predisposition to psychological reactions).
- Rash: Discontinue if severe rash (involving blistering, desquamation, mucosal involvement or fever) develops. Children are more susceptible to development of rash; prophylactic antihistamines may be used.
- Renal toxicity: May cause renal toxicity (acute renal failure and/or Fanconi syndrome); avoid use with concurrent or recent nephrotoxic therapy; monitor renal function during therapy.

Disease-related concerns:

- Chronic hepatitis B: **[U.S. Boxed Warning]: Safety and efficacy during coinfection of HIV and HBV have not been established; acute, severe exacerbations of HBV have been reported following discontinuation of antiretroviral therapy. Not indicated for treatment of chronic hepatitis B.** All patients with HIV should be tested for HBV prior to initiation of treatment. Caution in patients with known or suspected hepatitis B or

C infection (monitoring of liver function is recommended). In HBV coinfected patients, monitor hepatic function closely for several months following discontinuation.

- Hepatic impairment: Use caution in hepatic impairment.

- Renal impairment: Product is a fixed-dose combination and is not appropriate for use in renal impairment (Cl_{cr} <50 mL/minute).

- Seizure disorder: Use with caution in patients with a history of seizure disorder; seizures have been associated with use.

Concurrent drug therapy issues:

- High potential for interactions: Use with caution in patients taking strong CYP3A4 inhibitors, moderate or strong CYP3A4 inducers and major CYP3A4 substrates (see Drug Interactions); consider alternative agents that avoid or lessen the potential for CYP-mediated interactions.

Special populations:

- Pediatrics: Fixed dose combination product; safety and efficacy have not been established in patients <18 years of age. In children <40 kg, the dose of efavirenz would be excessive.

- Pregnancy: Avoid pregnancy; women of childbearing potential should undergo pregnancy testing prior to initiation of therapy.

Pregnancy Risk FactorD

Pregnancy ConsiderationsSee individual agents.

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsHIV-infected mothers are discouraged from breast-feeding to decrease potential transmission of HIV.

Adverse ReactionsThe complete adverse reaction profile of combination therapy has not been established. **See individual agents.** The following adverse effects were noted in clinical trials with combination therapy:

>10%: Endocrine & metabolic: Hypercholesterolemia (22%)

1% to 10%:

Central nervous system: Depression (9%), fatigue (9%), dizziness (8%), headache (6%), anxiety (5%), insomnia (5%), somnolence (4%), abnormal dreams

Dermatologic: Rash (7%)

Endocrine & metabolic: Triglycerides increased (4%), hyperglycemia (2%)

Gastrointestinal: Nausea (9%), diarrhea (9%), serum amylase increased (8%), vomiting (2%)

Hematologic: Neutropenia (3%)

Hepatic: AST increased (3%), ALT increased (2%), alkaline phosphatase increased (1%)

Neuromuscular & skeletal: Creatine increased (9%)

Renal: Hematuria (3%)

Respiratory: Sinusitis (8%), upper respiratory infection (8%), nasopharyngitis (5%)

<1%: Glycosuria

Metabolism/Transport Effects

Efavirenz: **Substrate** (major) of CYP2B6, 3A4; **Inhibits** CYP2C9 (moderate), 2C19 (moderate), 3A4 (moderate); **Induces** CYP2B6 (weak), 3A4 (strong)

Tenofovir: **Inhibits** CYP1A2 (weak)

Drug Interactions

Acyclovir-Valacyclovir: May decrease the excretion of Tenofovir. *Risk C: Monitor therapy*

Adefovir: May diminish the therapeutic effect of Tenofovir. Specifically, adefovir-associated mutations in Hepatitis B viral reverse transcriptase may decrease viral susceptibility to tenofovir. Tenofovir may increase the serum concentration of Adefovir. Similarly, Adefovir may increase the concentration of Tenofovir. *Risk D: Consider therapy modification*

Atazanavir: Tenofovir may decrease the serum concentration of Atazanavir. Atazanavir may increase the serum concentration of Tenofovir. Management: When combined use required, tenofovir 300mg and atazanavir 300mg should be used together with ritonavir 100mg, all given as a single daily dose with food. Atazanavir without ritonavir should not be used with tenofovir. *Risk D: Consider therapy modification*

Atazanavir: Efavirenz may decrease the serum concentration of Atazanavir. *Risk D: Consider therapy modification*

Caspofungin: Inducers of Drug Clearance may decrease the serum concentration of Caspofungin. Management: Consider using an increased caspofungin dose of 70mg daily in adults (or 70mg/m^2, up to a maximum of 70mg, daily in pediatric patients) when coadministered with known inducers of drug clearance. *Risk D: Consider therapy modification*

Cisapride: Efavirenz may enhance the QTc-prolonging effect of Cisapride. *Risk X: Avoid combination*

CYP2B6 Inducers (Strong): May increase the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2C19 Substrates: CYP2C19 Inhibitors (Moderate) may decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Moderate) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Substrates: CYP3A4 Inducers (Strong) may increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Substrates: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Darunavir: May increase the serum concentration of Efavirenz. Efavirenz may decrease the serum concentration of Darunavir. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Didanosine: Tenofovir may diminish the therapeutic effect of Didanosine. Tenofovir may increase the serum concentration of Didanosine. *Risk D: Consider therapy modification*

Eplerenone: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Eplerenone. Management: A lower starting dose of eplerenone (25 mg once daily) is recommended in patients with hypertension who are also taking drugs that are moderate inhibitors of CYP3A4. *Risk D: Consider therapy modification*

Ergot Derivatives: Efavirenz may enhance the adverse/toxic effect of Ergot Derivatives. Specifically, the risk for peripheral vasospasm and ischemia may be increased. *Risk X: Avoid combination*

Etravirine: Reverse Transcriptase Inhibitors (Non-Nucleoside) may decrease the serum concentration of Etravirine. This has been observed with the NNRTIs efavirenz and nevirapine. Reverse Transcriptase Inhibitors (Non-Nucleoside) may increase the serum concentration of Etravirine. This has been observed with delavirdine. *Risk X: Avoid combination*

FentaNYL: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Ganciclovir-Valganciclovir: May enhance the adverse/toxic effect of Reverse Transcriptase Inhibitors (Nucleoside). Hematologic toxicity is of specific concern. *Risk D: Consider therapy modification*

Ganciclovir-Valganciclovir: May decrease the excretion of Tenofovir. *Risk C: Monitor therapy*

Itraconazole: Efavirenz may decrease the serum concentration of Itraconazole. *Risk D: Consider therapy modification*

LamiVUDine: May enhance the adverse/toxic effect of Emtricitabine. *Risk X: Avoid combination*

Lopinavir: Efavirenz may decrease the serum concentration of Lopinavir. Management: An increased dose of lopinavir/ritonavir to 500mg/125mg (for tablets) or 533mg/133mg (for oral solution) twice daily is recommended when used concurrently with efavirenz. Avoid once daily use of lopinavir/ritonavir when used with efavirenz. *Risk D: Consider therapy modification*

Lopinavir: May enhance the nephrotoxic effect of Tenofovir. Lopinavir may increase the serum concentration of Tenofovir. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Methadone: Reverse Transcriptase Inhibitors (Non-Nucleoside) may increase the metabolism of Methadone. *Risk D: Consider therapy modification*

Midazolam: Efavirenz may increase the serum concentration of Midazolam. *Risk X: Avoid combination*

Nilotinib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Nilotinib. *Risk X: Avoid combination*

Nisoldipine: CYP3A4 Inducers (Strong) may decrease the serum concentration of Nisoldipine. *Risk X: Avoid combination*

Phenytoin: May decrease the serum concentration of Efavirenz. Efavirenz may increase the serum concentration of Phenytoin. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Pimozide: Efavirenz may enhance the arrhythmogenic effect of Pimozide. *Risk X: Avoid combination*

Posaconazole: Efavirenz may decrease the serum concentration of Posaconazole. *Risk X: Avoid combination*

Protease Inhibitors: Efavirenz may increase the metabolism of Protease Inhibitors. This specifically includes amprenavir, indinavir, and saquinavir. Efavirenz may increase the serum concentration of Protease Inhibitors. This specifically includes nelfinavir and ritonavir. *Risk D: Consider therapy modification*

Protease Inhibitors: Tenofovir may decrease the serum concentration of Protease Inhibitors. Protease Inhibitors may increase the serum concentration of Tenofovir. **Exceptions:** Saquinavir. *Risk C: Monitor therapy*

Raltegravir: Efavirenz may decrease the serum concentration of Raltegravir. *Risk C: Monitor therapy*

Ranolazine: CYP3A4 Inducers (Strong) may decrease the serum concentration of Ranolazine. *Risk X: Avoid combination*

Ranolazine: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Ranolazine. Management: Limit the ranolazine dose to a maximum of 500mg twice daily in patients concurrently receiving moderate CYP3A4 inhibitors (e.g., diltiazem, verapamil, erythromycin, etc.). *Risk D: Consider therapy modification*

Ribavirin: May enhance the hepatotoxic effect of Reverse Transcriptase Inhibitors (Nucleoside). Lactic acidosis may occur. *Risk D: Consider therapy modification*

Rifabutin: Efavirenz may decrease the serum concentration of Rifabutin. Rifabutin may decrease the serum concentration of Efavirenz. Management: If efavirenz is to be used with daily rifabutin, increase the planned rifabutin dose by 50%. If used with regimens where rifabutin is administered 2-3 times per week, consider doubling the rifabutin dose. *Risk D: Consider therapy modification*

Rifampin: May decrease the serum concentration of Efavirenz. Management: Efavirenz dose adjustment (to 800mg daily) may be required, particularly for patients weighing more than 60kg. *Risk C: Monitor therapy*

Salmeterol: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

Sertraline: Efavirenz may decrease the serum concentration of Sertraline. *Risk C: Monitor therapy*

Sorafenib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Sorafenib. *Risk D: Consider therapy modification*

St Johns Wort: May decrease the serum concentration of Efavirenz. *Risk X: Avoid combination*

Triazolam: Efavirenz may increase the serum concentration of Triazolam. *Risk X: Avoid combination*

Vitamin K Antagonists (eg, warfarin): Efavirenz may increase the serum concentration of Vitamin K Antagonists. *Risk C: Monitor therapy*

Voriconazole: Reverse Transcriptase Inhibitors (Non-Nucleoside) may decrease the serum concentration of Voriconazole. Voriconazole may increase the serum concentration of Reverse Transcriptase Inhibitors (Non-Nucleoside). Management: Efavirenz and voriconazole should not be coadministered at standard doses. Concurrent therapy is acceptable if voriconazole is dosed at 400 mg every 12 hours and efavirenz is dosed at 300 mg daily throughout the course of therapy. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (hepatic and CNS adverse effects).

Food: Avoid high-fat meals (increase the absorption of efavirenz). Food decreases peak plasma concentrations of emtricitabine, but does not alter the extent of absorption or overall systemic exposure. Fatty meals may increase the bioavailability of tenofovir.

Herb/Nutraceutical: St John's wort may decrease efavirenz serum levels. Concurrent use is contraindicated.

Test InteractionsFalse-positive test for cannabinoids have been reported when the CEDIA DAU Multilevel THC assay is used in patients receiving efavirenz. False-positive results with other assays for cannabinoids have not been observed.

Monitoring ParametersTesting for HBV is recommended prior to the initiation of antiretroviral therapy. Monitor CBC with differential, reticulocyte count, serum creatine kinase, CD4 count, HIV RNA plasma levels, renal and hepatic function tests, cholesterol, triglycerides, bone density (long-term), serum phosphorus. Serum transaminases (discontinuation of treatment should be considered for persistent elevations >5 times ULN).

Patients with HIV and HBV coinfection should have hepatic function monitored for several months following discontinuation.

Nursing: Physical Assessment/MonitoringSee individual agents.

Monitoring: Lab TestsTesting for HBV is recommended prior to the initiation of antiretroviral therapy. Monitor CBC with differential, reticulocyte count, serum creatine kinase, CD4 count, HIV RNA plasma levels, renal and hepatic function tests, cholesterol, triglycerides, bone density (long-term), serum phosphorus. Serum transaminases (discontinuation of treatment should be considered for persistent elevations >5 times ULN).

Patients with HIV and HBV coinfection should have hepatic function monitored for several months following discontinuation.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Efavirenz alone has caused xerostomia (normal salivary flow resumes upon discontinuation) and abnormal taste (see individual monograph). No significant effects or complications reported with combination drug.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause severe depression, suicidal ideation, paranoia, or mania. May also cause dizziness, drowsiness, and impaired concentration.

Mental Health: Effects on Psychiatric TreatmentContraindicated with midazolam, triazolam, and ergot alkaloids. Concurrent use with St John's wort is not recommended. Levels of citalopram, fluoxetine, and sertraline may be increased; monitor response.

Index TermsEmtricitabine, Efavirenz, and Tenofovir; FTC, TDF, and EFV; Tenofovir Disoproxil Fumarate, Efavirenz, and Emtricitabine

Pronunciation(e FAV e renz)

U.S. Brand NamesSustiva®

Canadian Brand NamesSustiva®

Pharmacologic CategoryAntiretroviral Agent, Reverse Transcriptase Inhibitor (Non-nucleoside)

Use: Labeled IndicationsTreatment of HIV-1 infections in combination with at least two other antiretroviral agents

Dosing: Adults

HIV infection (as part of combination): Oral: 600 mg once daily

Dosage adjustment for concomitant voriconazole: Reduce efavirenz dose to 300 mg once daily and increase voriconazole to 400 mg every 12 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricDosage is based on body weight.

HIV infection (as part of combination): Oral: Children ≥3 years:

10 kg to <15 kg: 200 mg once daily

15 kg to <20 kg: 250 mg once daily

20 kg to <25 kg: 300 mg once daily

25 kg to <32.5 kg: 350 mg once daily

32.5 kg to <40 kg: 400 mg once daily

≥40 kg: 600 mg once daily

Dosing: Renal ImpairmentNo adjustment is necessary.

Dosing: Hepatic ImpairmentLimited clinical experience - use with caution.

Administration: OralAdminister on an empty stomach. Dosing at bedtime is recommended to limit central nervous system effects. Tablets should not be broken. Capsules may be opened and added to liquid or food.

Dietary ConsiderationsShould be taken on an empty stomach.

StorageStore at controlled room temperature of 25°C (77°F), excursion permitted to 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to efavirenz or any component of the formulation; concurrent use of cisapride, midazolam, pimozide, triazolam, voriconazole (with standard [eg, unadjusted] voriconazole and efavirenz doses), or ergot alkaloids (includes dihydroergotamine, ergotamine, ergonovine, methylergonovine)

Allergy Considerations

- Efavirenz Allergy

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression (eg, impaired concentration, dizziness or drowsiness); avoid potentially hazardous tasks such as driving or operating machinery.
- Fat redistribution: May cause redistribution of fat (eg, buffalo hump, peripheral wasting with increased abdominal girth, cushingoid appearance).
- Hypercholesterolemia: Increases in total cholesterol and triglycerides have been reported; screening should be done prior to therapy and periodically throughout treatment.
- Immune reconstitution syndrome: Patients may develop immune reconstitution syndrome resulting in the occurrence of an inflammatory response to an indolent or residual opportunistic infection; further evaluation and treatment may be required.
- Psychiatric effects: Serious psychiatric side effects have been associated with use, including severe depression, suicide, paranoia, and mania; use with caution in patients with a history of mental illness/drug abuse (predisposition to psychological reactions).
- Rash: Discontinue if severe rash (involving blistering, desquamation, mucosal involvement or fever) develops. Children are more susceptible to development of rash; prophylactic antihistamines may be used.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment, including known or suspected hepatitis B or C infection; monitoring is recommended. Persistent elevations of serum transaminases >5 times the upper limit of normal should prompt evaluation - benefit of continued therapy should be weighed against possible risk of hepatotoxicity.

- Seizure disorder: Use with caution in patients with a history of seizure disorder; seizures have been associated with use.

Concurrent drug therapy issues:

- High potential for interactions: Use with caution in patients taking strong CYP3A4 inhibitors, moderate or strong CYP3A4 inducers and major CYP3A4 substrates (see Drug Interactions); consider alternative agents that avoid or lessen the potential for CYP-mediated interactions.

- Sedatives: CNS effects may be potentiated when used with other sedative drugs or ethanol.

- St John's wort: May decrease the therapeutic efficacy of efavirenz; concurrent use not recommended.

Special populations:

- Pregnancy: Avoid pregnancy; women of childbearing potential should undergo pregnancy testing prior to initiation of therapy.

Pregnancy Risk FactorD

Pregnancy ConsiderationsTeratogenic effects have been observed in Primates receiving efavirenz. Severe CNS defects have been reported in infants following efavirenz exposure in the first trimester. Pregnancy should be avoided and alternate therapy should be considered in women of childbearing potential. Women of childbearing potential should undergo pregnancy testing prior to initiation of efavirenz. Barrier contraception should be used in combination with other (hormonal) methods of contraception and for 12 weeks after efavirenz is discontinued. If therapy with efavirenz is administered during pregnancy, avoid use during the first trimester. Health professionals are encouraged to contact the antiretroviral pregnancy registry to monitor outcomes of pregnant women exposed to antiretroviral medications (1-800-258-4263 or www.APRegistry.com).

LactationExcretion is breast milk unknown/contraindicated

Breast-Feeding ConsiderationsHIV-infected mothers are discouraged from breast-feeding to decrease potential transmission of HIV.

Adverse Reactions

Unless otherwise noted, frequency of adverse events is as reported in adults receiving combination antiretroviral therapy.

>10%:

Central nervous system: Dizziness (2% to 28%; children 16%), fever (children 21%), depression (up to 19%; severe: 1% to 2%), insomnia (up to 16%), anxiety (2% to 13%), pain (1% to 13%; children 14%), headache (2% to 8%; children 11%)

Dermatologic: Rash (5% to 26%, grade 3/4: <1%; children up to 46%, grade 3/4: 2% to 4%)

Endocrine & metabolic: HDL increased (25% to 35%), total cholesterol increased (20% to 40%), triglycerides increased (≥751 mg/dL: 6% to 11%)

Gastrointestinal: Diarrhea (3% to 14%; children: up to 39%), nausea (2% to 12%; children 12%), vomiting (3% to 6%; children 12%)

Respiratory: Cough (children 16%)

1% to 10%:

Central nervous system: Impaired concentration (up to 8%), somnolence (up to 7%), fatigue (up to 8%), abnormal dreams (1% to 6%), nervousness (2% to 7%), hallucinations (1%)

Dermatologic: Pruritus (up to 9%)

Endocrine & metabolic: Hyperglycemia (>250 mg/dL: 2% to 5%)

Gastrointestinal: Dyspepsia (up to 4%), abdominal pain (2% to 3%), anorexia (up to 2%), amylase increased (grade 3/4: up to 6%)

Hematologic: Neutropenia (grade 3/4: 2% to 10%)

Hepatic: Transaminases increased (grade 3/4: 2% to 8%, incidence higher with hepatitis B and/or C coinfection)

Miscellaneous: Diaphoresis increased (1% to 2%)

<1%, postmarketing, and/or case reports: Allergic reaction, aggressive reaction, agitation, arthralgia, ataxia, balance disturbances, body fat accumulation/redistribution, cerebellar coordination disturbances, constipation, coordination abnormal, delusions, dermatitis (photoallergic), dyspnea, emotional lability, erythema multiforme, flushing, gynecomastia, hepatic failure, hepatitis, hypoesthesia, immune reconstitution syndrome, malabsorption, mania, myalgia, myopathy, nail disorder, neuropathy, neurosis, palpitation, paranoia, paresthesia, psychosis, seizure, skin discoloration, Stevens-Johnson syndrome, suicide attempts, suicidal ideation, tinnitus, tremor, visual abnormality, weakness

Metabolism/Transport Effects**Substrate** (major) of CYP2B6, 3A4; **Inhibits** CYP2C9 (moderate), 2C19 (moderate), 3A4 (moderate); **Induces** CYP2B6 (weak), 3A4 (strong)

Drug Interactions

Atazanavir: Efavirenz may decrease the serum concentration of Atazanavir. *Risk D: Consider therapy modification*

Caspofungin: Inducers of Drug Clearance may decrease the serum concentration of Caspofungin. Management: Consider using an increased caspofungin dose of 70mg daily in adults (or $70mg/m^2$, up to a maximum of 70mg, daily in pediatric patients) when coadministered with known inducers of drug clearance. *Risk D: Consider therapy modification*

Cisapride: Efavirenz may enhance the QTc-prolonging effect of Cisapride. *Risk X: Avoid combination*

CYP2B6 Inducers (Strong): May increase the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2C19 Substrates: CYP2C19 Inhibitors (Moderate) may decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Moderate) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Substrates: CYP3A4 Inducers (Strong) may increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Substrates: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Darunavir: May increase the serum concentration of Efavirenz. Efavirenz may decrease the serum concentration of Darunavir. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Eplerenone: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Eplerenone. Management: A lower starting dose of eplerenone (25 mg once daily) is recommended in patients with hypertension who are also taking drugs that are moderate inhibitors of CYP3A4. *Risk D: Consider therapy modification*

Ergot Derivatives: Efavirenz may enhance the adverse/toxic effect of Ergot Derivatives. Specifically, the risk for peripheral vasospasm and ischemia may be increased. *Risk X: Avoid combination*

Etravirine: Reverse Transcriptase Inhibitors (Non-Nucleoside) may decrease the serum concentration of Etravirine. This has been observed with the NNRTIs efavirenz and nevirapine. Reverse Transcriptase Inhibitors (Non-Nucleoside) may increase the serum concentration of Etravirine. This has been observed with delavirdine. *Risk X: Avoid combination*

FentaNYL: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Itraconazole: Efavirenz may decrease the serum concentration of Itraconazole. *Risk D: Consider therapy modification*

Lopinavir: Efavirenz may decrease the serum concentration of Lopinavir. Management: An increased dose of lopinavir/ritonavir to 500mg/125mg (for tablets) or 533mg/133mg (for oral solution) twice daily is recommended when used concurrently with efavirenz. Avoid once daily use of lopinavir/ritonavir when used with efavirenz. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Methadone: Reverse Transcriptase Inhibitors (Non-Nucleoside) may increase the metabolism of Methadone. *Risk D: Consider therapy modification*

Midazolam: Efavirenz may increase the serum concentration of Midazolam. *Risk X: Avoid combination*

Nilotinib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Nilotinib. *Risk X: Avoid combination*

Nisoldipine: CYP3A4 Inducers (Strong) may decrease the serum concentration of Nisoldipine. *Risk X: Avoid combination*

Phenytoin: May decrease the serum concentration of Efavirenz. Efavirenz may increase the serum concentration of Phenytoin. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Pimozide: Efavirenz may enhance the arrhythmogenic effect of Pimozide. *Risk X: Avoid combination*

Posaconazole: Efavirenz may decrease the serum concentration of Posaconazole. *Risk X: Avoid combination*

Protease Inhibitors: Efavirenz may increase the metabolism of Protease Inhibitors. This specifically includes amprenavir, indinavir, and saquinavir. Efavirenz may increase the serum concentration of Protease Inhibitors. This specifically includes nelfinavir and ritonavir. *Risk D: Consider therapy modification*

Raltegravir: Efavirenz may decrease the serum concentration of Raltegravir. *Risk C: Monitor therapy*

Ranolazine: CYP3A4 Inducers (Strong) may decrease the serum concentration of Ranolazine. *Risk X: Avoid combination*

Ranolazine: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Ranolazine. Management: Limit the ranolazine dose to a maximum of 500mg twice daily in patients concurrently receiving moderate CYP3A4 inhibitors (e.g., diltiazem, verapamil, erythromycin, etc.). *Risk D: Consider therapy modification*

Rifabutin: Efavirenz may decrease the serum concentration of Rifabutin. Rifabutin may decrease the serum concentration of Efavirenz. Management: If efavirenz is to be used with daily rifabutin, increase the planned rifabutin dose by 50%. If used with regimens where rifabutin is administered 2-3 times per week, consider doubling the rifabutin dose. *Risk D: Consider therapy modification*

Rifampin: May decrease the serum concentration of Efavirenz. Management: Efavirenz dose adjustment (to 800mg daily) may be required, particularly for patients weighing more than 60kg. *Risk C: Monitor therapy*

Salmeterol: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

Sertraline: Efavirenz may decrease the serum concentration of Sertraline. *Risk C: Monitor therapy*

Sorafenib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Sorafenib. *Risk D: Consider therapy modification*

St Johns Wort: May decrease the serum concentration of Efavirenz. *Risk X: Avoid combination*

Triazolam: Efavirenz may increase the serum concentration of Triazolam. *Risk X: Avoid combination*

Vitamin K Antagonists (eg, warfarin): Efavirenz may increase the serum concentration of Vitamin K Antagonists. *Risk C: Monitor therapy*

Voriconazole: Reverse Transcriptase Inhibitors (Non-Nucleoside) may decrease the serum concentration of Voriconazole. Voriconazole may increase the serum concentration of Reverse Transcriptase Inhibitors (Non-Nucleoside). Management: Efavirenz and voriconazole should not be coadministered at standard doses. Concurrent therapy is acceptable if voriconazole is dosed at 400 mg every 12 hours and efavirenz is dosed at 300 mg daily throughout the course of therapy. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (hepatic and CNS adverse effects).

Food: Avoid high-fat meals (increase the absorption of efavirenz).

Herb/Nutraceutical: St John's wort may decrease efavirenz serum levels. Avoid concurrent use.

Test InteractionsFalse-positive test for cannabinoids have been reported when the CEDIA DAU Multilevel THC assay is used. False-positive results with other assays for cannabinoids have not been observed.

Monitoring ParametersSerum transaminases (discontinuation of treatment should be considered for persistent elevations greater than five times the upper limit of normal), cholesterol, triglycerides, signs and symptoms of infection

Nursing: Physical Assessment/MonitoringUse caution in presence of or history of hepatic impairment or mental illness/drug abuse (increased risk of serious psychiatric side effects). Assess other pharmacological or herbal products patient may be taking for potential interactions or toxicity (multiple liver enzyme interactions may increase or decrease levels/effects of drugs and increase potential for severe toxicity or loss of effectiveness); dosing adjustments may be necessary. A list of medications that should not be used in conjunction with this agent is available in each bottle and patient should be provided with that information. Evaluate results of laboratory tests prior to beginning therapy and periodically throughout therapy. Assess effectiveness of therapy (decrease in infections and progress of disease - viral load and CD4 count) and adverse reactions (eg, CNS effects, redistribution of body fat, hyperglycemia, hyperlipidemia, cushingoid appearance) periodically during therapy. Teach patient proper use (eg, timing of multiple medications), possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsMonitor serum transaminases (discontinuation of treatment should be considered for persistent elevations greater than five times the upper limit of normal), cholesterol, and triglycerides.

Patient EducationYou will be provided with a list of specific medications that should not be used during therapy: Do not take any new prescription or over-the-counter medications or herbal products during therapy - even if they are not on the list - without consulting prescriber. This drug will not cure HIV, nor has it been found to reduce transmission of HIV; use appropriate precautions to prevent spread to other persons. This medication will be prescribed with a combination of other medications; time these medications as directed by prescriber. Take exactly as directed (usually at bedtime) on an empty stomach; swallow capsules or tablets whole with water. Maintain adequate hydration (2-3 L/day of fluids) unless advised by prescriber to restrict fluids. You may be susceptible to infection (avoid crowds and exposure to known infections and do not have any vaccinations without consulting prescriber). Frequent blood tests may be required with prolonged therapy. You may be advised to check your glucose levels; this drug can cause hyperglycemia. May cause dizziness, insomnia, or impaired concentration (use caution when driving or engaging in tasks that require alertness until response to medication is known); nausea, vomiting, or abdominal pain (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); or diarrhea (boiled milk, yogurt, or buttermilk may help). May cause changes in body fat; increased fat in upper back and neck and around trunk; and loss of fat from extremities and face. Report immediately any CNS changes (depression, anxiety, suicidal ideation, abnormal dreams, hallucinations, nervousness, impaired concentration). Report rash, persistent gastrointestinal upset, or other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant while taking this medication. Consult prescriber for appropriate contraceptives; some contraceptives are contraindicated with this medication. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Capsule:

Sustiva®: 50 mg; 100 mg [DSC]; 200 mg

Tablet:

Sustiva®: 600 mg

Generic AvailableNo

ManufacturerBristol-Myers Squibb Company (Pharmaceutical Division)

Pricing: U.S. (www.drugstore.com)

Capsules (Sustiva)

50 mg (90): $135.76

100 mg (90): $272.08

200 mg (90): $546.03

Tablets (Sustiva)

600 mg (30): $545.97

Mechanism of ActionAs a non-nucleoside reverse transcriptase inhibitor, efavirenz has activity against HIV-1 by binding to reverse transcriptase. It consequently blocks the RNA-dependent and DNA-dependent DNA polymerase activities including HIV-1 replication. It does not require intracellular phosphorylation for antiviral activity.

Pharmacodynamics/Kinetics

Absorption: Increased by fatty meals

Distribution: CSF concentrations exceed free fraction in serum

Protein binding: >99%, primarily to albumin

Metabolism: Hepatic via CYP3A4 and 2B6 to inactive hydroxylated metabolites; may induce its own metabolism

Half-life elimination: Single dose: 52-76 hours; Multiple doses: 40-55 hours

Time to peak: 3-5 hours

Excretion: Feces (16% to 61% primarily as unchanged drug); urine (14% to 34% as metabolites)

Related Information

- Antiretroviral Agents

Pharmacotherapy PearlsEfavirenz oral solution is available only through an expanded access (compassionate use) program. Enrollment information may be obtained by calling 1-877-372-7097.

Early virologic failure was observed with tenofovir and didanosine delayed release capsules, plus either efavirenz or nevirapine; use caution in treatment-naive patients with high baseline viral loads.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Abnormal taste

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusSerious psychiatric adverse effects have been reported. May cause severe depression, suicidal ideation, aggressive behavior, paranoia, and mania. Patients with a psychiatric history appear to be at a greater risk for these psychiatric effects. May cause difficulty in concentration, insomnia, abnormal dreams, sedation, nervousness, and fatigue. May rarely cause hallucinations, psychosis, anxiety, euphoria, emotional lability, agitation.

Mental Health: Effects on Psychiatric TreatmentShould not be administered with other drugs known to be metabolized by the CYP3A4 system (midazolam, triazolam, ergot alkaloids) as combination may lead to life-threatening adverse effects. Coadministration with St John's wort is expected to substantially decrease NNRTI concentrations, and may result in suboptimal levels and lead to loss of virologic response and possible resistance to efavirenz or to the class of NNRTIs.

Medication Safety Issues

Sound-alike/look-alike issues:

Vaniqa™ may be confused with Viagra®

Pronunciation(ee FLOR ni theen)
U.S. Brand NamesVaniqa™
Canadian Brand NamesVaniqa™
Pharmacologic CategoryAntiprotozoal; Topical Skin Product
Use: Labeled IndicationsCream: Females ≥12 years: Reduce unwanted hair from face and adjacent areas under the chin

Orphan status: Injection: Treatment of meningoencephalitic stage of *Trypanosoma brucei gambiense* infection (sleeping sickness)

Dosing: Adults

Unwanted facial hair (Females): Topical: Apply thin layer of cream to affected areas of face and adjacent chin twice daily, at least 8 hours apart.

Treatment of infections caused by*Trypanosoma*: I.V. infusion (orphan drug): 100 mg/kg/dose given every 6 hours (over at least 45 minutes) for 14 days.

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricUnwanted facial hair (females): Children ≥12 years: Refer to adult dosing.
Dosing: Renal ImpairmentInjection: Dose should be adjusted although no specific guidelines are available.
Administration: I.M.Not for I.M. use.
Administration: I.V.Can only be administered I.V.; infuse over 45 minutes.
Administration: OtherApply thin layer of eflornithine cream to affected areas of face and adjacent chin area twice daily, at least 8 hours apart. Rub in thoroughly. Hair removal techniques must still be continued; wait at least 5 minutes after removing hair to apply cream. Do not wash affected area for at least 8 hours following application.
Storage

Injection: Must be diluted before use and used within 24 hours of preparation.

Cream: Store at controlled room temperature 25°C (77°F); do not freeze.

ContraindicationsHypersensitivity to eflornithine or any component of the formulation
Warnings/Precautions

Dosage form specific issues:

- Cream: For topical use by females only; discontinue if hypersensitivity occurs; safety and efficacy in children <12 years of age have not been studied.
- Injection: For I.V. use only; not for I.M. administration. Must be diluted before use; frequent monitoring for myelosuppression should be done; use with caution in patients with a history of seizures and in patients with renal impairment; serial audiograms should be obtained; due to the potential for relapse, patients should be followed up for at least 24 months.

Pregnancy Risk FactorC
Pregnancy ConsiderationsThere are no adequate and well-controlled studies of topical eflornithine cream in pregnant women. The potential benefits to the mother versus the possible risks to the fetus should be considered prior to use.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions

Injection:

>10%: Hematologic (reversible): Anemia (55%), leukopenia (37%), thrombocytopenia (14%)

1% to 10%:

Central nervous system: Seizure (may be due to the disease) (8%), dizziness

Dermatologic: Alopecia

Gastrointestinal: Vomiting, diarrhea

Hematologic: Eosinophilia

Otic: Hearing impairment

<1%: Abdominal pain, anorexia, facial edema, headache, weakness

Topical:

>10%: Dermatologic: Acne (11% to 21%), pseudofolliculitis barbae (5% to 15%)

1% to 10%:

Central nervous system: Headache (4% to 5%), dizziness (1%), vertigo (0.3% to 1%)

Dermatologic: Pruritus (3% to 4%), burning skin (2% to 4%), tingling skin (1% to 4%), dry skin (2% to 3%), rash (1% to 3%), facial edema (0.3% to 3%), alopecia (1% to 2%), skin irritation (1% to 2%), erythema (0% to 2%), ingrown hair (0.3% to 2%), folliculitis (0% to 1%)

Gastrointestinal: Dyspepsia (2%), anorexia (0.7% to 2%)

<1%: Bleeding skin, cheilitis, contact dermatitis, herpes simplex, lip swelling, nausea, numbness, rosacea, weakness

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersCBC with platelet counts

Nursing: Physical Assessment/MonitoringLaboratory tests and results should be monitored on regular basis during therapy. Serial audiograms are recommended. Monitor effectiveness according to purpose for use. Patient should be monitored for adverse reactions, especially with infusion administration. Assess knowledge/teach patient appropriate use, adverse reactions and possible interventions, and adverse reactions to report.

Monitoring: Lab TestsCBC with platelet counts

Patient EducationI.V.: This medication can only be administered I.V.; you will be closely monitored during therapy. Report immediately any signs of acute GI upset, seizures, altered hearing. You may lose your hair, however, it will grow back when therapy is discontinued.

Cream: This medication is for external use only. It will not prevent hair growth, but may decrease rate of growth. You will still need to use hair removal techniques while using eflornithine cream. Use only as directed; do not use more often or discontinue without consulting prescriber. Wait at least 5 minutes after removing hair to apply cream. Wash hands thoroughly prior to using cream. Apply thin lay of cream to affected areas of face and chin twice daily (at least 8 hours apart). Rub in thoroughly. Wash hands thoroughly after rubbing cream in. Do not wash area for 8 hours following application. Once cream has dried you may apply make-up over the affected area. Improvement may be seen in 4-8 weeks. Following discontinuation of therapy you may see hair growth return in about 8 weeks. You may be required to have blood tests if used for extended period of time. Report any skin irritation, rash, tingling, or skin eruptions; persistent headache, dizziness; or GI disturbances.

Pregnancy/breast-feeding precautions: Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Cream, topical, as hydrochloride: 13.9% (30 g)

Injection, solution, as hydrochloride: 200 mg/mL (100 mL) [orphan drug status]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Cream (Vaniqa)

13.9% (30): $44.99

Mechanism of ActionEflornithine exerts antitumor and antiprotozoal effects through specific, irreversible (“suicide”) inhibition of the enzyme ornithine decarboxylase (ODC). ODC is the rate-limiting enzyme in the biosynthesis of putrescine, spermine, and spermidine, the major polyamines in nucleated cells. Polyamines are necessary for the synthesis of DNA, RNA, and proteins and are, therefore, necessary for cell growth and differentiation. Although many microorganisms and higher plants are able to produce polyamines from alternate biochemical pathways, all mammalian cells depend on ornithine decarboxylase to produce polyamines. Eflornithine inhibits ODC and rapidly depletes animal cells of putrescine and spermidine; the concentration of spermine remains the same or may even increase. Rapidly dividing cells appear to be most susceptible to the effects of eflornithine. Topically, the inhibition of ODC in the skin leads to a decreased rate of hair growth.

Pharmacodynamics/Kinetics

Absorption: Topical: <1%

Half-life elimination: I.V.: 3-3.5 hours; Topical: 8 hours

Excretion: Primarily urine (as unchanged drug)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness is common

Mental Health: Effects on Psychiatric TreatmentLeukopenia is common; use caution with clozapine and carbamazepine

Electrolyte Solution, Renal Replacement

Lexi-Drugs Online

Jump To Field (Select Field Name)

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(ee LEK trow lite soe LOO shun REE nil ree PLASE ment)

U.S. Brand NamesNormocarb HF™; PrismaSol

Pharmacologic CategoryAlkalinizing Agent; Electrolyte Supplement

Use: Labeled IndicationsUsed as a replacement solution to replenish water, correct electrolytes, and adjust acid-base balance depleted by hemofiltration or hemodiafiltration (continuous renal replacement therapy [CRRT])

Dosing: Adults**Note:** If using PrismaSol™, ensure that compartment A and B are mixed.

Continuous renal replacement circuit: Pre- or post-filter: Volume of solution administered depends upon the patient's fluid balance, target fluid balance, body weight, and amount of fluid removed during hemofiltration process.

Post-filter replacement: Volume infused/hour should not be greater than $^1/_3$ of blood flow rate (eg, blood flow rate 100 mL/minute [6000 mL/hour], post-filter replacement rate ≤2000 mL/hour)

Dosing: PediatricRefer to adult dosing.

Dosing: Hepatic ImpairmentAbility to convert lactate to bicarbonate may be impaired; use solutions containing lactate cautiously.

Administration: OtherMay heat to ≤40°C (104°F) before administration.

Normocarb HF™ (pH 8.3-8.8, osmolarity: 283 mOsm/L): Dilute by adding to 3 L bag of sterile water for injection before use.

PrismaSol™ (pH 7-8.5, osmolarity: 287-300 mOsm/L [depending on mixture]): Mix compartments A and B together before use.

Storage

Normocarb HF™: Store undiluted solution at 20°C to 25°C (68°F to 77°F). Do not freeze. Diluted solution can be stored at room temperature or refrigerated at 2°C to 30°C (36°F to 86°F); use within 24 hours.

PrismaSol™: Store solution at 15°C to 30°C (59°F to 86°F). Once the overwrap is removed, PrismaSol™ should be mixed and used within 24 hours.

ReconstitutionEvaluate final solutions for precipitate.

Normocarb HF™: Must be diluted with sterile water for injection before use. Do not use normal saline, lactated Ringer's, or any other diluent. Add 240 mL vial to 3 L bag of sterile water for injection. Final volume: 3.24 L. Additional additives may be incorporated in the final solution, using aseptic technique. Do not exceed concentration guidelines of additives. Potassium ≤4 mEq/L, calcium ≤2.5 mEq/L, D_{50} W ≤6 g (12 mL), and/or phosphate ≤1.2 mmol/L may be added. Total potassium concentration should be ≤4 mEq/L.

PrismaSol™: Electrolyte solution (compartment A containing 250 mL) must be mixed with buffer solution (compartment B containing 4750 mL) before use. Final volume: 5 L. Additional additives may be incorporated in the final solution, using aseptic technique. Do not exceed concentration guidelines of additives. Potassium ≤4 mEq/L and/or phosphate ≤1.2 mmol/L may be added. Total potassium concentration should be ≤4 mEq/L.

ContraindicationsThere are no contraindications listed in manufacturer's labeling.

Warnings/Precautions

Concerns related to adverse effects:

- Continuous renal replacement therapy: Can cause hypokalemia, hypocalcemia, hypophosphatemia, and hypoglycemia. Monitor closely and correct with appropriate replacement solution.

Disease-related concerns:

- Diabetes mellitus or glucose intolerance: May require insulin adjustment when using the PrismaSol™ solutions as some contain dextrose. Adjusting solutions or rates of administration may cause changes in dextrose delivery.

Concurrent drug therapy issues:

- Anticoagulants: Citrate, when used as an anticoagulant, can contribute to the base load and cause hypocalcemia.

Dosage form specific issues:

- Normocarb HF™: Dilute prior to use.

- PrismaSol™: Mix compartment A and B prior to use. If not mixed, patient may experience severe reductions in electrolytes (magnesium, calcium)/glucose.

Other warnings/precautions:

- Appropriate use: Only for use as replacement fluid in patients receiving continuous renal replacement therapy under direct supervision of an intensivist. Use only with continuous extracorporeal blood purification equipment in CRRT.

Adverse ReactionsFrequency not defined: Endocrine & metabolic: Acid/base abnormalities; electrolyte (potassium, calcium, phosphorous) abnormalities; fluid imbalances; glucose abnormalities

Monitoring ParametersHemodynamic status, electrolyte and acid-base balance, serum glucose. Fluid balance record extremely important as this system requires hourly calculations of replacement fluids to be given.

Monitoring: Lab TestsHemodynamic status, electrolyte and acid-base balance, serum glucose. Fluid balance record extremely important as this system requires hourly calculations of replacement fluids to be given.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [concentrate; preservative free]:

Normocarb HF™ 25: Bicarbonate 25 mEq/L, chloride 116.5 mEq/L, magnesium 1.5 mEq/L, sodium 140 mEq/L (240 mL) [strength represents final solution after mixing; when diluted as directed, makes 3240 mL of infusate]

Normocarb HF™ 35: Bicarbonate 35 mEq/L, chloride 106.5 mEq/L, magnesium 1.5 mEq/L, sodium 140 mEq/L (240 mL) [strength represents final solution after mixing; when diluted as directed, makes 3240 mL of infusate]

Injection, solution [preservative free]:

PrismaSol BGK 0/2.5: Bicarbonate 32 mEq/L, calcium 2.5 mEq/L, chloride 109 mEq/L, dextrose 100 mg/dL, lactate 3 mEq/L, magnesium 1.5 mEq/L, sodium 140 mEq/L (5000 mL) [strength represents final solution after mixing]

PrismaSol BGK 2/0: Bicarbonate 32 mEq/L, chloride 108 mEq/L, dextrose 100 mg/dL, lactate 3 mEq/L, magnesium 1 mEq/L, potassium 2 mEq/L, sodium 140 mEq/L (5000 mL) [strength represents final solution after mixing]

PrismaSol BGK 2/3.5: Bicarbonate 32 mEq/L, calcium 3.5 mEq/L, chloride 111.5 mEq/L, dextrose 100 mg/dL, lactate 3 mEq/L, magnesium 1 mEq/L, potassium 2 mEq/L, sodium 140 mEq/L (5000 mL) [strength represents final solution after mixing]

PrismaSol BGK 4/2.5: Bicarbonate 32 mEq/L, calcium 2.5 mEq/L, chloride 113 mEq/L, dextrose 100 mg/dL, lactate 3 mEq/L, magnesium 1.5 mEq/L, potassium 4 mEq/L, sodium 140 mEq/L (5000 mL) [strength represents final solution after mixing]

PrismaSol BK 0/3.5: Bicarbonate 32 mEq/L, calcium 3.5 mEq/L, chloride 109.5 mEq/L, lactate 3 mEq/L, magnesium 1 mEq/L, sodium 140 mEq/L (5000 mL) [strength represents final solution after mixing]

Mechanism of ActionReplacement fluids achieve fluid and electrolyte balance by substituting for the ultrafiltrate removed during some forms of continuous renal replacement therapies. Replacement solutions may vary in composition and may include a buffer and electrolytes to manage acid-base disorders and electrolyte imbalances.

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Eletriptan

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(el e TRIP tan)
U.S. Brand NamesRelpax®
Canadian Brand NamesRelpax®
Pharmacologic CategoryAntimigraine Agent; Serotonin 5-$HT_{1B, 1D}$ Receptor Agonist
Use: Labeled IndicationsAcute treatment of migraine, with or without aura
Dosing: AdultsAcute migraine: Oral: 20-40 mg; if the headache improves but returns, dose may be repeated after 2 hours have elapsed since first dose; maximum 80 mg/day

Note: If the first dose is ineffective, diagnosis needs to be re-evaluated. Safety of treating >3 headaches/month has not been established.

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal ImpairmentNo dosing adjustment needed; monitor for increased blood pressure.
Dosing: Hepatic Impairment

Mild-to-moderate impairment: No adjustment necessary.

Severe impairment: Use is contraindicated.

StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).
ContraindicationsHypersensitivity to eletriptan or any component of the formulation; ischemic heart disease or signs or symptoms of ischemic heart disease (including Prinzmetal's angina, angina pectoris, MI, silent myocardial ischemia); cerebrovascular syndromes (including strokes, transient ischemic attacks); peripheral vascular syndromes (including ischemic bowel disease); uncontrolled hypertension; use within 24 hours of ergotamine derivatives; use within 24 hours of another 5-HT_1 agonist; use within 72 hours of potent CYP3A4 inhibitors; management of hemiplegic or basilar migraine; prophylactic treatment of migraine; severe hepatic impairment
Allergy Considerations

- Serotonin 5-$HT_{1B,1D}$ Receptor Agonist Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Cardiac events: Coronary artery vasospasm, transient ischemia, myocardial infarction, ventricular tachycardia/fibrillation, cardiac arrest, and death have been reported with 5-HT_1 agonist administration. Patients who experience sensations of chest pain/pressure/tightness or symptoms suggestive of angina following dosing should be evaluated for coronary artery disease or Prinzmetal's angina before receiving additional doses.

- Cerebrovascular events: Cerebral/subarachnoid hemorrhage and stroke have been reported with 5-HT_1 agonist administration.

- Elevated blood pressure: Significant elevation in blood pressure, including hypertensive crisis, has also been reported on rare occasions in patients with and without a history of hypertension.

- Vasospasm-related events: Peripheral vascular ischemia and colonic ischemia have been reported with 5-HT_1 agonist.

Disease-related concerns:

- Coronary artery disease: Should not be given to patients who have risk factors for CAD (eg, hypertension, hypercholesterolemia, smoker, obesity, diabetes, strong family history of CAD, menopause, male >40 years of age) without adequate cardiac evaluation. Patients with suspected CAD should have cardiovascular evaluation to rule out CAD before considering use; if cardiovascular evaluation “is satisfactory,” first dose should be given in the healthcare provider's office. Periodic evaluation of cardiovascular status should be done in all patients.

- Hepatic impairment: Use with caution in patients with hepatic impairment. Drug clearance may be reduced leading to increased plasma concentrations; dosage reduction is recommended. Do not use with severe impairment.

Concurrent drug therapy issues:

- Serotonin syndrome: Symptoms of agitation, confusion, hallucinations, hyper-reflexia, myoclonus, shivering, and tachycardia may occur with concomitant proserotonergic drugs (ie, SSRIs/SNRIs or triptans) or agents which reduce eletriptan's metabolism. Concurrent use of serotonin precursors (eg, tryptophan) is not recommended.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <18 years of age.

Other warnings/precautions:

- Appropriate use: Only indicated for treatment of acute migraine; if a patient does not respond to the first dose, the diagnosis of migraine should be reconsidered.

Geriatric ConsiderationsSince elderly often have cardiovascular disease, careful evaluation of the use of 5-HT agonists is needed to avoid complications with the use of these agents. Safety and efficacy in elderly >65 years of age have not been established, however, pharmacokinetic disposition is similar to that in younger adults. Use lowest recommended doses initially.
Pregnancy Risk FactorC
Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women; use during pregnancy only if the potential benefit to the mother outweighs the possible risk to the fetus. Teratogenic effects were observed in animal studies.
LactationEnters breast milk/use caution
Adverse Reactions

1% to 10%:

Cardiovascular: Chest pain/tightness (1% to 4%; placebo 1%), palpitation

Central nervous system: Dizziness (3% to 7%; placebo 3%), somnolence (3% to 7%; placebo 4%), headache (3% to 4%; placebo 3%), chills, pain, vertigo

Gastrointestinal: Nausea (4% to 8%; placebo 5%), xerostomia (2% to 4%, placebo 2%), dysphagia (1% to 2%), abdominal pain/discomfort (1% to 2%; placebo 1%), dyspepsia (1% to 2%; placebo 1%)

Neuromuscular & skeletal: Weakness (4% to 10%), paresthesia (3% to 4%), back pain, hypertonia, hypoesthesia

Respiratory: Pharyngitis

Miscellaneous: Diaphoresis

<1% (Limited to important or life-threatening): Agitation, allergic reaction, angina, arrhythmia, ataxia, confusion, constipation, CPK increased, depersonalization, depression, diarrhea, dreams (abnormal), dyspnea, edema, emotional lability, esophagitis, euphoria, hyperesthesia, hyperkinesia, hypertension, impotence, incoordination, insomnia, lacrimation disorder, liver function tests abnormal, myalgia, myasthenia, nervousness, peripheral vascular disorder, photophobia, polyuria, pruritus, rash, salivation increased, shock, speech disorder, stupor, tachycardia, taste perversion, thrombophlebitis, tinnitus, tongue edema, tremor, urinary frequency, vasospasm, vision abnormal

Metabolism/Transport Effects**Substrate** of CYP3A4 (major)
Drug Interactions

Antifungal Agents (Azole Derivatives, Systemic): May increase the serum concentration of Eletriptan. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Eletriptan. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Ergot Derivatives: May enhance the vasoconstricting effect of Serotonin 5-HT1D Receptor Agonists. Serotonin 5-HT1D Receptor Agonists may enhance the vasoconstricting effect of Ergot Derivatives. *Risk X: Avoid combination*

Fluconazole: May decrease the metabolism of Eletriptan. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Eletriptan. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsFood: High-fat meal increases bioavailability.
Nursing: Physical Assessment/MonitoringFor use with clear diagnosis of migraine. Assess for potential for interactions with other pharmacological agents or herbal products patient may be taking (eg, ergot-containing drugs, other 5-HT$_1$ agonists). Assess therapeutic effectiveness (relief of migraine) and adverse response (hypertension, cardiac events). Teach patient proper use, possible side effects/appropriate interventions and adverse symptoms to report.
Patient EducationThis drug is to be used to reduce your migraine, not to prevent the number of attacks. Follow exact instructions for use. Do not crush, break, or chew tablet. Do not take within 24 hours of any other medication without first consulting prescriber. If headache improves but returns, dose may be repeated after 2 hours. Do not exceed two doses in 24 hours (may take either 20 mg or 40 mg twice daily). If you have no relief with the first dose, do not take a second dose without consulting prescriber. May cause dizziness or drowsiness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, or abdominal pain. Report immediately any chest pain, tightness, or palpitations; muscle weakness or tremors; back pain; respiratory difficulty; changes in CNS (abnormal thought processes, depression, insomnia, confusion, agitation); swelling of eyelids, face, lips, throat; rash, hives, or any other adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as hydrobromide: 20 mg, 40 mg [as base]

Generic AvailableNo
ManufacturerPfizer, Inc

Pricing: U.S. (www.drugstore.com)

Tablets (Relpax)

20 mg (6): $119.29

40 mg (6): $119.68

Mechanism of ActionSelective agonist for serotonin (5-HT$_{1B}$, 5-HT$_{1D}$, 5-HT$_{1F}$ receptors) in cranial arteries; causes vasoconstriction and reduce sterile inflammation associated with antidromic neuronal transmission correlating with relief of migraine

Pharmacodynamics/Kinetics

Absorption: Well absorbed

Distribution: V$_d$: 138 L

Protein binding: ~85%

Metabolism: Hepatic via CYP3A4; forms one metabolite (active)

Bioavailability: ~50%, increased with high-fat meal

Half-life elimination: 4 hours (Elderly: 4.4-5.7 hours); Metabolite: ~13 hours

Time to peak, plasma: 1.5-2 hours

Related Information

- Antimigraine Drugs: 5-HT1 Receptor Agonists

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation)

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Cardiovascular ConsiderationsCoronary vasospasm has been associated with 5-HT$_{1B/1D}$ agonists. These agents are contraindicated in patients with documented ischemic of vasospastic coronary artery disease. Patients with risk factors for CAD may receive these agents, provided a cardiovascular evaluation yields satisfactory evidence that the patient is free of cardiovascular disease. In patients with risk factors for CAD, administration of the initial dose in a medically staffed/equipped facility (ie, physician's office) is recommended. In addition, ECG monitoring after the initial dose should be considered. Patients who acquire risk factors for CAD, or long-term users of agents from this class of medications, should undergo periodic cardiovascular evaluation.

Eltrombopag

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(el TROM boe pag)

U.S. Brand NamesPromacta®

Pharmacologic CategoryColony Stimulating Factor; Thrombopoietic Agent

Use: Labeled IndicationsTreatment of thrombocytopenia in patients with chronic immune (idiopathic) thrombocytopenic purpura (ITP) at risk for bleeding who have had insufficient response to corticosteroids, immune globulin, or splenectomy

Dosing: Adults**Note:** Discontinue if platelet count does not respond to a level that avoids clinically important bleeding after 4 weeks at the maximum daily dose of 75 mg.

ITP: Oral: Initial: 50 mg once daily; adjust dose to achieve and maintain platelet count ≥50,000/mm^3 to reduce the risk of bleeding; Maximum dose: 75 mg once daily

Dosage adjustment recommendations:

Platelet count <50,000/mm^3 (after at least 2 weeks): Increase daily dose by 25 mg; maximum dose: 75 mg/day

Platelet count >200,000/mm^3 (at any time): Reduce daily dose by 25 mg; reassess in 2 weeks

Platelet count >400,000/mm^3: Withhold dose; assess platelet count twice weekly; when platelet count <150,000/mm3, resume with the daily dose reduced by 25 mg

Platelet count >400,000/mm^3 after 2 weeks at the lowest dose: Permanently discontinue

Dosage adjustment for patients of East-Asian ethnicity (eg, Chinese, Japanese, Korean, Taiwanese): Initial dose: 25 mg once daily

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentHas not been evaluated in patients with renal impairment; monitor closely.

Dosing: Hepatic Impairment

Mild impairment: No adjustment required.

Moderate-to-severe impairment: Initial dose: 25 mg once daily.

Dosing: Adjustment for Toxicity

ALT levels ≥3 times the upper limit of normal (ULN) **and** which are progressive, or persistent (≥4 weeks), or accompanied by increased direct bilirubin, or accompanied by clinical signs of liver injury or evidence of hepatic decompensation: Discontinue treatment.

New or worsening cellular abnormalities or cytopenias: Discontinue treatment.

Administration: OralAdminister on an empty stomach, 1 hour before or 2 hours after a meal. Do not administer concurrently with antacids, foods high in calcium, or minerals (eg, iron, calcium, aluminum, magnesium, selenium, zinc); separate by at least 4 hours.

Dietary ConsiderationsTake on an empty stomach (1 hour before or 2 hours after a meal). Food, especially dairy products, may decrease the absorption of eltrombopag; allow at least 4 hours between dosing of eltrombopag and polyvalent cation intake (eg, dairy products, calcium-rich foods, multivitamins with minerals).

StorageStore at room temperature of 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).

RestrictionsEltrombopag is approved for marketing under a Food and Drug Administration (FDA) approved, risk management, and restricted distribution program called Promacta® Cares™ (1-877-977-6622). Patients, prescribers, and pharmacies must be enrolled in the program.

An FDA-approved medication guide is available, distribute to each patient to whom this medication is dispensed.

ContraindicationsThere are no contraindications listed within the manufacturer’s labeling.

Warnings/Precautions

Box warnings:

- Hepatotoxicity: See “Concerns related to adverse effects” below.
- Restricted access: See “Other warnings/precautions” below.

Concerns related to adverse effects:

- Bone marrow reticulin: May increase the risk for bone marrow reticulin formation or progression; collagen fibrosis (not associated with cytopenias) was observed in clinical trials. Monitor peripheral blood smear for cellular morphologic abnormalities; discontinue treatment with onset of new or worsening abnormalities or cytopenias and consider bone marrow biopsy.

- Cataract formation: Cataract formation or worsening was observed in clinical trials. Monitor regularly for signs and symptoms of cataracts; obtain ophthalmic exam at baseline and during therapy. Use with caution in patients at risk for cataracts (eg, advanced age, long-term glucocorticoid use).

- Hepatotoxicity: **[U.S. Boxed Warning]: May cause hepatotoxicity; obtain ALT/AST and bilirubin prior to treatment initiation, every 2 weeks during adjustment phase, then monthly. Obtain fractionation for elevated bilirubin levels. Repeat abnormal liver function tests within 3-5 days; if confirmed abnormal, monitor weekly until resolves, stabilizes, or returns to baseline. Discontinue treatment for ALT levels ≥3 times the upper limit of normal (ULN) and which are progressive, or persistent (≥4 weeks), or accompanied by increased direct bilirubin, or accompanied by clinical signs of liver injury or evidence of hepatic decompensation**. Reinitiation is not recommended; hepatotoxicity usually recurred with retreatment after therapy interruption. Use with caution in patients with pre-existing hepatic impairment; dosage reductions are recommended in patients moderate-to-severe hepatic dysfunction; monitor closely.

- Malignancy/tumorigenicity: Stimulation of cell surface thrombopoietin (TPO) receptors may increase the risk for hematologic malignancies.

- Rebound thrombocytopenia: Upon discontinuation of therapy, thrombocytopenia may worsen. Severity may be greater than pretreatment level. Risk of bleeding is increased, particularly in patients receiving anticoagulants or antiplatelet agents; monitor closely. Monitor for at least 4 weeks after treatment discontinuation.

- Thromboembolism: Thromboembolism may occur with excess increases in platelet levels. Use with caution in patients with known risk factors for thromboembolism (eg, Factor V Leiden, AT deficiency, antiphospholipid syndrome).

Disease-related concerns:

- Hepatic impairment: Clearance may be reduced in patients with hepatic impairment; use with caution; reduced starting doses are recommended in patients with moderate-to-severe hepatic impairment.

- Renal impairment: Safety and efficacy in renal impairment have not been established.

Concurrent drug therapy issues:

- Antacids/calcium/cation mineral supplements: May reduce eltrombopag levels; allow at least 4 hours between dosing of eltrombopag and antacids, minerals (eg, iron, calcium, aluminum, magnesium, selenium, zinc), or foods high in calcium.

Special populations:

- East-Asian ethnicity (eg, Chinese, Japanese, Korean, Taiwanese): May have greater drug exposure (compared to non-east Asians); therapy should be initiated with lower starting doses.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: Indicated only when the degree of thrombocytopenia and clinical conditions increase the risk for bleeding; use the lowest dose necessary to achieve and maintain platelet count ≥50,000/mm^3. Do not use to normalize platelet counts. Discontinue if platelet count does not respond to a level to avoid clinically important bleeding after 4 weeks at the maximum recommended dose.

- Restricted access: **[U.S. Boxed Warning]: Eltrombopag is available through a restricted access program called Promacta Cares™; prescribers, pharmacies and patients must be registered with the program.** The program maintains a patient registry and requires prescribers to monitor and report baseline and periodic safety information related to hepatotoxicity, thromboembolic events, bone marrow reticulin events, rebound thrombocytopenia (after cessation), and malignancies.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAdverse effects were observed in animal studies. There are no adequate and well-controlled studies in pregnant women. Use during pregnancy only if the potential benefit to the mother outweighs the potential risk to the fetus. A Promacta® pregnancy registry has been established to monitor outcomes of women exposed to eltrombopag during pregnancy (1-888-825-5249).

LactationExcretion in breast milk unknown/ not recommended

Breast-Feeding ConsiderationsDue to the potential for serious adverse effects in the nursing infant, breast-feeding is not recommended.

Adverse Reactions

1% to 10%:

Dermatologic: Rash (≤7%), bruising (2%)

Endocrine & metabolic: Menorrhagia (4%)

Gastrointestinal: Nausea (6%), vomiting (4%), dyspepsia (2%)

Hematologic: Rebound thrombocytopenia (10%), thrombocytopenia (2%)

Hepatic: Liver function tests abnormal (10%), ALT increased (2%), AST increased (2%)

Neuromuscular & skeletal: Limb pain (≤7%), myalgia (3%), paresthesia (3%)

Ocular: Cataract (3%), conjunctival hemorrhage (2%)

<1%, postmarketing, and/or case reports: Bone marrow collagen fiber deposits, bone marrow reticulin fiber deposits, cataract worsening, epistaxis, headache, hemorrhage (due to thrombocytopenia or rebound thrombocytopenia), non-Hodgkin’s lymphoma, thrombotic/thromboembolic complications

Metabolism/Transport Effects

Substrate of CYP1A2, CYP2C8, UGT 1A1, UGT1A3; **Inhibits** OATP1B1, UGT1A1, UGT1A3, UGT1A4, UGT1A6, UGT1A9, UGT2B7, and UGT2B15

Drug Interactions

Antacids: May decrease the absorption of eltrombopag; separate administration by at least 4 hours.

Cation mineral supplements (eg, iron, calcium, aluminum, magnesium, selenium, zinc): May reduce eltrombopag absorption; separate administration by at least 4 hours

OATP1B1 substrates (eg, rosuvastatin): Eltrombopag may decrease the metabolism of rosuvastatin; dose reductions of rosuvastatin (50%) may be required.

Ethanol/Nutrition/Herb InteractionsFood: Food, especially dairy products, may decrease the absorption of eltrombopag; allow at least 4 hours between dosing of eltrombopag and polyvalent cation intake (eg, dairy products, calcium-rich foods, multivitamins with minerals).

Monitoring ParametersLiver tests, including ALT, AST, and bilirubin (baseline, every 2 weeks during dosage titration, then monthly; monitor weekly if retreating [not recommended] after therapy interruption for hepatotoxicity); bilirubin fractionation (for elevated bilirubin); CBC with differential and platelet count (weekly at initiation and during dosage titration, then monthly when stable; continue monitoring for ≥4 weeks after cessation); peripheral blood smear (baseline and monthly when stable), bone marrow biopsy (if peripheral blood smear reveals abnormality); ophthalmic exam (baseline and during treatment)

Reference RangeTarget platelet count (with treatment) of 50,000-200,000/mm^3; platelet life span: 8-11 days

Monitoring: Lab TestsLiver tests, including ALT, AST, and bilirubin (baseline, every 2 weeks during dosage titration, then monthly; monitor weekly if retreating [not recommended] after therapy interruption for hepatotoxicity); bilirubin fractionation (for elevated bilirubin); CBC with differential and platelet count (weekly at initiation and during dosage titration, then monthly when stable; continue monitoring for ≥4 weeks after cessation); peripheral blood smear (baseline and monthly when stable)

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Promacta®: 25 mg, 50 mg

Generic AvailableNo

ManufacturerGlaxo SmithKline, Inc

Mechanism of ActionThrombopoietin (TPO) nonpeptide agonist which increases platelet counts by binding to and activating the human TPO receptor. Activates intracellular signal transduction pathways to increase proliferation and differentiation of marrow progenitor cells. Does not induce platelet aggregation or activation.

Pharmacodynamics/Kinetics

Onset of action: Platelet count increase: Within 1-2 weeks

Peak platelet count increase: 14-16 days

Duration of action: Platelets return to baseline: 1-2 weeks after last dose

Protein binding: >99%

Metabolism: Extensive hepatic metabolism; via CYP 1A2, 2C8 oxidation and UGT 1A1, 1A3 glucuronidation

Bioavailability: ~52%

Half-life elimination: ~21-32 hours in healthy individuals; ~26-35 hours in patients with ITP

Time to peak, plasma: 2-6 hours

Excretion: Feces (~59%, 20% as unchanged drug, 21% glutathione-related conjugates); urine (31%, 20% glucuronide of the phenypyrazole moiety)

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Dactinomycin: I.V. push: 0.5 mg/day days 1 and 2

[total dose/cycle = 1 mg]

Leucovorin: Oral, I.M.: 15 mg twice daily for 2 days (start 24 hours after the start of methotrexate) days 2 and 3

[total dose/cycle = 60 mg]

Alternate weekly with:

Cyclophosphamide: I.V.: 600 mg/m^2 day 1

[total dose/cycle = 600 mg/m^2]

Vincristine: I.V. push: 0.8 mg/m^2 (maximum 2 mg) day 1

[total dose/cycle = 0.8 mg/m^2]

Repeat cycle every 2 weeks

Variation 2:

Dactinomycin: I.V.: 0.5 mg/day days 1 and 2

[total dose/cycle = 1 mg]

Etoposide: I.V.: 100 mg/m^2/day days 1 and 2

[total dose/cycle = 200 mg/m^2]

Methotrexate: I.V. bolus: 100 mg/m^2 then 200 mg/m^2 continuous infusion over 12 hours day 1

[total dose/cycle = 300 mg/m^2]

Leucovorin: Oral, I.M.: 15 mg every 12 hours for 4 doses (start 24 hours after methotrexate) days 2 and 3

[total dose/cycle = 60 mg]

Vincristine: I.V.: 1 mg/m^2 day 8

[total dose/cycle = 1 mg/m^2]

Cyclophosphamide: I.V.: 600 mg/m^2 day 8

[total dose/cycle = 600 mg/m^2]

Repeat cycle every 2 weeks

Variation 3:

Dactinomycin: I.V.: 0.5 mg/day days 1 and 2

[total dose/cycle = 1 mg]

Etoposide: I.V.: 100 mg/m^2/day days 1 and 2

[total dose/cycle = 200 mg/m^2]

Methotrexate: I.V.: 300 mg/m^2 continuous infusion over 12 hours day 1

[total dose/cycle = 300 mg/m^2]

Leucovorin: Oral, I.M.: 15 mg every 12 hours for 4 doses (start 24 hours after start of methotrexate) days 2 and 3

[total dose/cycle = 60 mg]

Vincristine: I.V.: 1 mg/m^2 day 8

[total dose/cycle = 1 mg/m^2]

Cyclophosphamide: I.V.: 600 mg/m^2 day 8

[total dose/cycle = 600 mg/m^2]

Repeat cycle every 2 weeks

Variation 4:

Dactinomycin: I.V.: 0.35 mg/m^2/day days 1 and 2

[total dose/cycle = 0.7 mg/m^2]

Etoposide: I.V.: 100 mg/m^2/day days 1 and 2

[total dose/cycle = 200 mg/m^2]

Methotrexate: I.V. bolus: 100 mg/m^2 then 200 mg/m^2 continuous infusion over 12 hours day 1

[total dose/cycle = 300 mg/m^2]

Leucovorin: Oral, I.M.: 15 mg every 12 hours for 4 doses (start 24 hours after start of methotrexate) days 2 and 3

[total dose/cycle = 60 mg]

Vincristine: I.V.: 1 mg/m^2 day 8

[total dose/cycle = 1 mg/m^2]

Cyclophosphamide: I.V.: 600 mg/m^2 day 8

[total dose/cycle = 600 mg/m^2]

Repeat cycle every 2 weeks

Variation 5 (patients with brain metastases):

Dactinomycin: I.V.: 0.5 mg/day days 1 and 2

[total dose/cycle = 1 mg]

Etoposide:I.V.: 100 mg/m^2/day days 1 and 2

[total dose/cycle = 200 mg/m^2]

Methotrexate: I.V.: 1 g/m^2 continuous infusion over 12 hours day 1

[total dose/cycle = 1 g/m^2]

Leucovorin: I.M.: 20 mg/m^2 every 6 hours for 12 doses (start 24 hours after start of methotrexate) days 2, 3, and 4

[total dose/cycle = 240 mg/m^2]

Vincristine: I.V.: 1 mg/m^2 day 8

[total dose/cycle = 1 mg/m^2]

Cyclophosphamide: I.V.: 600 mg/m^2 day 8

[total dose/cycle = 600 mg/m^2]

Repeat cycle every 2 weeks

Variation 6 (patients with brain metastases):

Dactinomycin: I.V.: 0.5 mg/day days 1 and 2

[total dose/cycle = 1 mg]

Etoposide: I.V.: 100 mg/m^2/day days 1 and 2

[total dose/cycle = 200 mg/m^2]

Methotrexate: I.V.: 1 g/m^2 continuous infusion over 12 hours day 1

[total dose/cycle = 1 g/m^2]

Leucovorin: Oral, I.M.: 30 mg/m^2 every 12 hours for 6 doses (start 32 hours after start of methotrexate) days 2, 3, and 4

[total dose/cycle = 180 mg/m^2]

Vincristine: I.V.: 1 mg/m^2 day 8

[total dose/cycle = 1 mg/m^2]

Cyclophosphamide: I.V.: 600 mg/m^2 day 8

[total dose/cycle = 600 mg/m^2]

Repeat cycle every 2 weeks

Variation 7:

Dactinomycin: I.V.: 0.5 mg/day days 1 and 2

[total dose/cycle = 1 mg]

Etoposide: I.V.: 100 mg/m^2/day days 1 and 2

[total dose/cycle = 200 mg/m^2]

Methotrexate: I.V.: 1 g/m^2 continuous infusion over 24 hours day 1

[total dose/cycle = 1 g/m^2]

Leucovorin: Oral, I.M.: 15 mg every 8 hours for 9 doses (start 32 hours after start of methotrexate) days 2, 3, and 4

[total dose/cycle = 135 mg/m^2]

Vincristine: I.V.: 1 mg/m^2 day 8

[total dose/cycle = 1 mg/m^2]

Cyclophosphamide: I.V.: 600 mg/m^2 day 8

[total dose/cycle = 600 mg/m^2]

Repeat cycle every 2 weeks

Variation 8 (patients with lung metastases):

Dactinomycin: I.V.: 0.5 mg/day days 1 and 2

[total dose/cycle = 1 mg]

Etoposide: I.V.: 100 mg/m^2/day days 1 and 2

[total dose/cycle = 200 mg/m^2]

Methotrexate: I.V. bolus: 100 mg/m^2 then 200 mg/m^2 continuous infusion over 12 hours day 1

[total dose/cycle = 300 mg/m^2]

Leucovorin: Oral, I.M.: 15 mg every 12 hours for 4 doses (start 24 hours after start of methotrexate) days 2 and 3

[total dose/cycle = 60 mg]

Vincristine: I.V.: 1 mg/m^2 day 8

[total dose/cycle = 1 mg/m^2]

Cyclophosphamide: I.V.: 600 mg/m^2 day 8

[total dose/cycle = 600 mg/m^2]

Methotrexate: I.T.: 10 mg day 1 (every other cycle)

[total dose/cycle = 10 mg, every other cycle]

Repeat cycle every 2 weeks

Variation 9 (patients with lung metastases):

Dactinomycin: I.V.: 0.5 mg/day days 1 and 2

[total dose/cycle = 1 mg]

Etoposide: I.V.: 100 mg/m^2/day days 1 and 2

[total dose/cycle = 200 mg/m^2]

Methotrexate: I.V. bolus: 100 mg/m^2 then 200 mg/m^2 continuous infusion over 12 hours day 1

[total dose/cycle = 300 mg/m^2]

Leucovorin: Oral, I.M.: 15 mg every 12 hours for 4 doses (start 24 hours after start of methotrexate) days 2 and 3

[total dose/cycle = 60 mg]

Vincristine: I.V.: 1 mg/m^2 day 8

[total dose/cycle = 1 mg/m^2]

Cyclophosphamide: I.V.: 600 mg/m^2 day 8

[total dose/cycle = 600 mg/m^2]

Methotrexate: I.T.: 12.5 mg day 8

[total dose/cycle = 12.5 mg]

Repeat cycle every 2 weeks

Emedastine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(em e DAS teen)
U.S. Brand NamesEmadine®
Pharmacologic CategoryHistamine H_1 Antagonist; Histamine H_1 Antagonist, Second Generation
Use: Labeled IndicationsTreatment of allergic conjunctivitis
Dosing: AdultsAllergic conjunctivitis: Ophthalmic: Instill 1 drop in affected eye up to 4 times/day
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricChildren ≥3 years: Refer to adult dosing.
Administration: OtherEmadine® is for topical ophthalmic use only, **not** for injection. Soft contact lenses should not be worn during treatment if eyes are red; if there is no redness, wait 10 minutes following emedastine instillation before inserting contact lenses. Do not allow dropper tip to touch eyelids or surrounding area of the eye.
StorageStore at 4°C to 30°C (39°F to 86°F). Solution should not be used if it becomes discolored.
ContraindicationsHypersensitivity to emedastine or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Bacterial keratitis: Inadvertent contamination of multiple-dose ophthalmic solutions has caused bacterial keratitis.

Special populations:

- Contact lens wearers: Contains benzalkonium chloride which may be absorbed by contact lenses; remove contact lenses prior to use and wait 15 minutes before reinserting.

- Pediatrics: Safety and efficacy have not been established in children <3 years of age.

Other warnings/precautions:

- Appropriate use: For topical ophthalmic use only.

Pregnancy Risk FactorB
LactationExcretion in breast milk unknown/use caution
Adverse Reactions

>10%: Central nervous system: Headache (11%)

1% to 10%:

Cardiovascular: Hyperemia

Central nervous system: Abnormal dreams

Dermatologic: Dermatitis, keratitis, pruritus

Gastrointestinal: Taste (unpleasant)

Neuromuscular & skeletal: Weakness

Ocular: Blurred vision, corneal infiltrates, corneal staining, dry eyes, transient burning or stinging

Respiratory: Rhinitis, sinusitis

Miscellaneous: Tearing

Drug InteractionsThere are no known significant interactions.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, ophthalmic, as difumarate: 0.05% (5 mL) [contains benzalkonium chloride]

ManufacturerAlcon Laboratories, Inc
Pricing: U.S. (www.drugstore.com)

Solution (Emadine)

0.05% (5): $70.99

Mechanism of ActionSelective histamine H_1-receptor antagonist for topical ophthalmic use
Pharmacodynamics/Kinetics

Absorption: Ocular: Minimal

Half-life elimination: Oral: Plasma: 3-4 hours

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status May cause drowsiness or abnormal dreams

Mental Health: Effects on Psychiatric Treatment None reported

Index Terms Emedastine Difumarate

Pronunciation(em trye SYE ta been & te NOE fo veer)

U.S. Brand NamesTruvada®

Canadian Brand NamesTruvada®

Pharmacologic Category[Antiretroviral Agent, Reverse Transcriptase Inhibitor (Nucleoside)](); [Antiretroviral Agent, Reverse Transcriptase Inhibitor (Nucleotide)]()

Use: Labeled IndicationsTreatment of HIV infection in combination with other antiretroviral agents

Dosing: AdultsHIV: Oral: One tablet (emtricitabine 200 mg and tenofovir 300 mg) once daily

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} 30-49 mL/minute: Increase interval to every 48 hours.

Cl_{cr} <30 mL/minute or hemodialysis: Not recommended.

Calculations

- [Creatinine Clearance: Adults]()

Administration: OralMay be administered with or without food. If used with didanosine; refer to didanosine monograph for additional information.

Dietary ConsiderationsMay be taken without regard to meals. Consider calcium and vitamin D supplementation in patients with history of bone fracture or osteopenia.

StorageStore tablets at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to emtricitabine, tenofovir, or any component of the formulation; severe renal impairment (Cl_{cr} <30 mL/minute); concurrent use of single-agent tenofovir (Viread®) or other tenofovir-containing combination formulations (eg, Atripla™)

Warnings/Precautions

Boxed warnings:

- Chronic hepatitis B: See “Disease-related concerns” below.
- Lactic acidosis/hepatomegaly: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Decreased bone mineral density: Use has been associated with decreases in bone mineral density (~5% to 7%) and osteomalacia. Consider monitoring of bone density in patients at risk for osteopenia or with a history of pathologic fractures; consider calcium and vitamin D supplementation.
- Fat redistribution: May cause redistribution of fat (eg, buffalo hump, peripheral wasting with increased abdominal girth, cushingoid appearance).
- Immune reconstitution syndrome: Patients may develop immune reconstitution syndrome resulting in the occurrence of an inflammatory response to an indolent or residual opportunistic infection; further evaluation and treatment may be required.
- Lactic acidosis/hepatomegaly: **[U.S Boxed Warning]: Lactic acidosis and severe hepatomegaly with steatosis have been reported with nucleoside analogues, including fatal cases;** use with caution in patients with risk factors for liver disease (risk may be increased with female gender, obesity, pregnancy or prolonged exposure) and suspend treatment in any patient who develops clinical or laboratory findings suggestive of lactic acidosis or hepatotoxicity (transaminase elevation may/may not accompany hepatomegaly and steatosis).
- Renal toxicity: May cause renal toxicity (acute renal failure and/or Fanconi syndrome); avoid use with concurrent or recent nephrotoxic therapy. Calculate creatinine clearance prior to initiation of therapy and monitor renal function (including recalculation of creatinine clearance and serum phosphorus) during therapy. Dosage adjustment required in patients with Cl_{cr} <50 mL/minute.

Disease-related concerns:

- Chronic hepatitis B: **[U.S. Boxed Warning]: Safety and efficacy during coinfection of HIV and HBV have not been established; acute, severe exacerbations of HBV have been reported following discontinuation of antiretroviral therapy.** All patients with HIV should be tested for HBV prior to initiation of treatment. Caution in patients with known or suspected hepatitis B or C infection (monitoring of liver function is recommended). In HBV coinfected patients, monitor hepatic function closely for several months following discontinuation.
- Hepatic impairment: Use with caution in patients with hepatic impairment. No dosage adjustment is required; limited studies indicate the pharmacokinetics of tenofovir are not altered in hepatic dysfunction.

- HIV: Appropriate use: Not recommended as a component of a triple nucleoside regimen.
- Renal impairment: Use with caution in patients with renal impairment (Cl_{cr} <50 mL/minute); dosage adjustment required.

Special populations:

- Pediatrics: Safety and efficacy have not been established in pediatric patients.

Pregnancy Risk FactorB
Pregnancy ConsiderationsRefer to individual agents.
LactationExcretion in breast milk unknown/not recommended
Breast-Feeding ConsiderationsHIV-infected women are discouraged from breast-feeding to decrease the potential transmission of HIV.
Adverse ReactionsThe adverse reaction profile of combination therapy has not been established. See individual agents.
Drug Interactions

Acyclovir-Valacyclovir: May decrease the excretion of Tenofovir. *Risk C: Monitor therapy*

Adefovir: May diminish the therapeutic effect of Tenofovir. Specifically, adefovir-associated mutations in Hepatitis B viral reverse transcriptase may decrease viral susceptibility to tenofovir. Tenofovir may increase the serum concentration of Adefovir. Similarly, Adefovir may increase the concentration of Tenofovir. *Risk D: Consider therapy modification*

Atazanavir: Tenofovir may decrease the serum concentration of Atazanavir. Atazanavir may increase the serum concentration of Tenofovir. Management: When combined use required, tenofovir 300mg and atazanavir 300mg should be used together with ritonavir 100mg, all given as a single daily dose with food. Atazanavir without ritonavir should not be used with tenofovir. *Risk D: Consider therapy modification*

Didanosine: Tenofovir may diminish the therapeutic effect of Didanosine. Tenofovir may increase the serum concentration of Didanosine. *Risk D: Consider therapy modification*

Ganciclovir-Valganciclovir: May enhance the adverse/toxic effect of Reverse Transcriptase Inhibitors (Nucleoside). Hematologic toxicity is of specific concern. *Risk D: Consider therapy modification*

Ganciclovir-Valganciclovir: May decrease the excretion of Tenofovir. *Risk C: Monitor therapy*

LamiVUDine: May enhance the adverse/toxic effect of Emtricitabine. *Risk X: Avoid combination*

Lopinavir: May enhance the nephrotoxic effect of Tenofovir. Lopinavir may increase the serum concentration of Tenofovir. *Risk C: Monitor therapy*

Protease Inhibitors: Tenofovir may decrease the serum concentration of Protease Inhibitors. Protease Inhibitors may increase the serum concentration of Tenofovir. **Exceptions:** Saquinavir. *Risk C: Monitor therapy*

Ribavirin: May enhance the hepatotoxic effect of Reverse Transcriptase Inhibitors (Nucleoside). Lactic acidosis may occur. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsFood: Food decreases peak plasma concentrations, but does not alter the extent of absorption or overall systemic exposure.
Monitoring ParametersCBC with differential, reticulocyte count, serum creatine kinase, CD4 count, HIV RNA plasma levels, renal and hepatic function tests, bone density (long-term), serum phosphorus; testing for HBV is recommended prior to the initiation of antiretroviral therapy

Patients with HIV and HBV coinfection should be monitored for several months following tenofovir discontinuation.

Nursing: Physical Assessment/MonitoringSee individual agents.
Patient EducationSee individual agents.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: Emtricitabine 200 mg and tenofovir disoproxil fumarate 300 mg

Generic AvailableNo
ManufacturerGilead
Pricing: U.S. (www.drugstore.com)

Tablets (Truvada)

200-300 mg (30): $904.13

Mechanism of ActionNucleoside and nucleotide reverse transcriptase inhibitor combination; emtricitabine is a cytosine analogue while tenofovir disoproxil fumarate (TDF) is an analog of adenosine 5'-monophosphate. Each drug interferes with HIV viral RNA dependent DNA polymerase resulting in inhibition of viral replication.
Pharmacodynamics/KineticsRefer to individual monographs.
Related Information

- Antiretroviral Agents
- Antiretroviral Therapy for HIV Infection: Adults and Adolescents
- Management of Healthcare Worker Exposures to HBV, HCV, and HIV

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusDepression, insomnia, and dizziness are common; may cause abnormal dreams and anxiety
Mental Health: Effects on Psychiatric TreatmentGI side effects are common; combined use with SSRIs (lithium or valproic acid) may produce

additive effects. May cause increases in serum triglycerides; monitor in patients receiving concurrent psychotropic medication especially, clozapine, olanzapine, quetiapine, or mirtazapine. May cause glucose abnormalities; use caution with clozapine, olanzapine, quetiapine, and risperidone. May cause neutropenia; use caution with clozapine and carbamazepine.

Index TermsTenofovir and Emtricitabine

Pronunciation(em trye SYE ta been)

U.S. Brand NamesEmtriva®

Canadian Brand NamesEmtriva®

Pharmacologic CategoryAntiretroviral Agent, Reverse Transcriptase Inhibitor (Nucleoside)

Use: Labeled IndicationsTreatment of HIV infection in combination with at least two other antiretroviral agents

Use: Unlabeled/InvestigationalHepatitis B (with HIV coinfection)

Dosing: AdultsHIV infection: Oral:

Capsule: 200 mg once daily

Solution: 240 mg once daily

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricHIV infection: Oral:

Children: 0-3 months: Solution: 3 mg/kg/day

Children: 3 months to 17 years:

Capsule: Children >33 kg: 200 mg once daily

Solution: 6 mg/kg once daily; maximum: 240 mg/day

Dosing: Renal ImpairmentAdults (consider similar adjustments in children):

Cl_{cr} 30-49 mL/minute: Capsule: 200 mg every 48 hours; solution: 120 mg every 24 hours

Cl_{cr} 15-29 mL/minute: Capsule: 200 mg every 72 hours; solution: 80 mg every 24 hours

Cl_{cr} <15 mL/minute (including hemodialysis patients): Capsule: 200 mg every 96 hours; solution: 60 mg every 24 hours; administer after dialysis on dialysis days

Dosing: Hepatic ImpairmentNo adjustment required.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralMay be administered with or without food.

Dietary ConsiderationsMay be taken with or without food.

StorageStore capsules at 15°C to 30°C (59°F to 86°F). Solution should be stored under refrigeration at 2°C to 8°C (36°F to 46°F). Once dispensed, may be stored at 15°C to 30°C (59°F to 86°F) if used within 3 months.

ContraindicationsHypersensitivity to emtricitabine or any component of the formulation

Warnings/Precautions

Boxed warnings:

- Chronic hepatitis B: See “Disease-related concerns” below.
- Lactic acidosis/hepatomegaly: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Fat redistribution: May cause redistribution of fat (eg, buffalo hump, peripheral wasting with increased abdominal girth, cushingoid appearance).
- Immune reconstitution syndrome: Patients may develop immune reconstitution syndrome resulting in the occurrence of an inflammatory response to an indolent or residual opportunistic infection; further evaluation and treatment may be required.
- Lactic acidosis/hepatomegaly: **[U.S Boxed Warning]: Lactic acidosis and severe hepatomegaly with steatosis have been reported with nucleoside analogues, including fatal cases;** use with caution in patients with risk factors for liver disease (risk may be increased with female gender, obesity, pregnancy or prolonged exposure) and suspend treatment in any patient who develops clinical or laboratory findings suggestive of lactic acidosis or hepatotoxicity (transaminase elevation may/may not accompany hepatomegaly and steatosis).

Disease-related concerns:

- Chronic hepatitis B: **[U.S. Boxed Warning]: Safety and efficacy during coinfection of HIV and HBV have not been established; acute, severe exacerbations of HBV have been reported following discontinuation of antiretroviral therapy. Not indicated for treatment of chronic hepatitis B.** All patients with HIV should be tested for HBV prior to initiation of treatment. Caution in patients with known or suspected hepatitis B or C infection (monitoring of liver function is recommended). In HBV coinfected patients, monitor hepatic function closely for several months following discontinuation.

- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment required.

Pregnancy Risk FactorB

Pregnancy Considerations Adverse events were not observed in animal studies, however, there are no studies of emtricitabine during human pregnancy. Cases of fatal and nonfatal lactic acidosis, with or without pancreatitis, have been reported in pregnant women receiving reverse transcriptase inhibitors. It is not known if pregnancy itself potentiates this known side effect; however, pregnant women may be at increased risk of lactic acidosis and liver damage. Hepatic enzymes and electrolytes should be monitored frequently during the 3rd trimester of pregnancy. The Perinatal HIV Guidelines Working Group considers emtricitabine to be an alternative NRTI in dual nucleoside combination regimens. Health professionals are encouraged to contact the antiretroviral pregnancy registry to monitor outcomes of pregnant women exposed to antiretroviral medications (1-800-258-4263 or www.APRegistry.com).

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsHIV-infected women are discouraged from breast-feeding to decrease the potential transmission of HIV.

Adverse Reactions Clinical trials were conducted in patients receiving other antiretroviral agents, and it is not possible to correlate frequency of adverse events with emtricitabine alone. The range of frequencies of adverse events is generally comparable to comparator groups, with the exception of hyperpigmentation, which occurred more frequently in patients receiving emtricitabine. Unless otherwise noted, percentages are as reported in adults.

>10%:

Central nervous system: Dizziness (4% to 25%), headache (6% to 22%), fever (children 18%), insomnia (5% to 16%), abnormal dreams (2% to 11%)

Dermatologic: Hyperpigmentation (children 32%; adults 2% to 4%; primarily of palms and/or soles but may include tongue, arms, lip and nails; generally mild and nonprogressive without associated local reactions such as pruritus or rash); rash (17% to 30%; includes pruritus, maculopapular rash, vesiculobullous rash, pustular rash, and allergic reaction)

Gastrointestinal: Diarrhea (children 20%; adults 9% to 23%), vomiting (children 23%; adults 9%), nausea (13% to 18%), abdominal pain (8% to 14%), gastroenteritis (children 11%)

Neuromuscular & skeletal: Weakness (12% to 16%), CPK increased (grades 3/4: 11% to 12%)

Otic: Otitis media (children 23%)

Respiratory: Cough (children 28%; adults 14%), rhinitis (children 20%; adults 12% to 18%), pneumonia (children 15%)

Miscellaneous: Infection (children 44%)

1% to 10%:

Central nervous system: Depression (6% to 9%), neuropathy/neuritis (4%)

Endocrine & metabolic: Serum triglycerides increased (grades 3/4: 4% to 10%), disordered glucose homeostasis (grades 3/4: 2% to 3%), serum amylase increased (grades 3/4: children 9%; adults 2% to 5%), serum lipase increased (grades 3/4: ≤1%)

Gastrointestinal: Dyspepsia (4% to 8%), serum amylase increased (grades 3/4: 8%)

Genitourinary: Hematuria (grades 3/4: 3%)

Hematologic: Anemia (children: 7%), neutropenia (grades 3/4: children 2%; adults 5%)

Hepatic: Transaminases increased (grades 3/4: 2% to 6%), alkaline phosphatase increased (>550 units/L: 1%), bilirubin increased (grades 3/4: 1%)

Neuromuscular & skeletal: Creatinine kinase increased (grades 3/4: 9%), myalgia (4% to 6%), paresthesia (5% to 6%), arthralgia (3% to 5%)

Respiratory: Upper respiratory tract infection (8%), sinusitis (8%), pharyngitis (5%)

Drug Interactions

Ganciclovir-Valganciclovir: May enhance the adverse/toxic effect of Reverse Transcriptase Inhibitors (Nucleoside). Hematologic toxicity is of specific concern. *Risk D: Consider therapy modification*

LamiVUDine: May enhance the adverse/toxic effect of Emtricitabine. *Risk X: Avoid combination*

Ribavirin: May enhance the hepatotoxic effect of Reverse Transcriptase Inhibitors (Nucleoside). Lactic acidosis may occur. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions Food: Food decreases peak plasma concentrations, but does not alter the extent of absorption or overall systemic exposure.

Monitoring Parameters Viral load, CD4, liver function tests; hepatitis B testing is recommended prior to initiation of therapy

Nursing: Physical Assessment/Monitoring Assess other pharmacologic or herbal products patient may be taking for potential interactions or toxicity; dosing adjustments may be necessary. Assess results of laboratory tests, effectiveness of therapy (viral load and CD4 count), and adverse reactions (eg, Lactic Acidosis) periodically during therapy. Teach patient proper use (eg, timing of multiple medications), possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsViral load, CD4, liver function tests; hepatitis B testing is recommended prior to initiation of therapy

Patient EducationDo not take any new prescription or over-the-counter medications or herbal products during therapy unless approved by prescriber. This drug will not cure HIV, nor has it been found to reduce transmission of HIV. Use appropriate precautions to prevent spread to other people. This drug is prescribed as one part of a multi-drug combination; time multiple medications exactly as directed for full course of therapy. Take with or without food. Maintain adequate hydration (2-3 L/day of fluids) unless advised by prescriber to restrict fluids. You may be susceptible to infection (avoid crowds and exposure to known infections, and do not have any vaccinations without consulting prescriber). Frequent blood tests may be required with prolonged therapy. May cause hyperpigmentation of hands, soles, or lips (normal). May cause headache, dizziness, or insomnia (use care when driving or engaged in potentially hazardous tasks until response to drug is know); nausea, vomiting, or abdominal pain (small frequent meals, chewing gum, good mouth care, or sucking lozenges may help); and diarrhea (boiled milk, yogurt, or buttermilk may help). Report persistent fast or rapid heartbeat, weakness or tiredness, muscle pain, respiratory difficulty, gastrointestinal upset, rash, or diarrhea; signs of infection (burning on urination, perineal itching, white plaques in mouth, unhealed sores, persistent sore throat, or cough); yellowing of skin or eyes, dark urine, or light stool; or other adverse side effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Emtriva®: 200 mg

Solution:

Emtriva®: 10 mg/mL (170 mL) [contains propylene glycol; cotton candy flavor]

Generic AvailableNo

ManufacturerGilead Sciences

Pricing: U.S. (www.drugstore.com)

Capsules (Emtriva)

200 mg (30): $392.65

Mechanism of ActionNucleoside reverse transcriptase inhibitor; emtricitabine is a cytosine analogue which is phosphorylated intracellularly to emtricitabine 5'-triphosphate which interferes with HIV viral RNA dependent DNA polymerase resulting in inhibition of viral replication.

Pharmacodynamics/Kinetics

Absorption: Rapid, extensive

Protein binding: <4%

Metabolism: Limited, via oxidation and conjugation (not via CYP isoenzymes)

Bioavailability: Capsule: 93%; solution: 75%

Half-life elimination: Normal renal function: Adults: 10 hours; children: 5-18 hours

Time to peak, plasma: 1-2 hours

Excretion: Urine (86% primarily as unchanged drug, 13% as metabolites); feces (14%)

Related Information

- Antiretroviral Agents
- Antiretroviral Therapy for HIV Infection: Adults and Adolescents
- Management of Healthcare Worker Exposures to HBV, HCV, and HIV

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusInsomnia and dizziness are common; may cause depression and abnormal dreams

Mental Health: Effects on Psychiatric TreatmentGI side effects are common. Combined use with SSRIs may produce additive effects. May cause increases in serum triglycerides. Monitor in patients receiving concurrent psychotropic medication especially, clozapine, olanzapine, quetiapine, or mirtazapine. May cause glucose abnormalities; use caution with clozapine, olanzapine, and quetiapine, and risperidone.

Index TermsBW524W91; Coviracil; FTC

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(e NAL a pril & fe LOE di peen)

U.S. Brand NamesLexxel® [DSC]

Canadian Brand NamesLexxel®

Pharmacologic CategoryAngiotensin-Converting Enzyme (ACE) Inhibitor; Calcium Channel Blocker

Use: Labeled IndicationsTreatment of hypertension, however, not indicated for initial treatment of hypertension; replacement therapy in patients receiving separate dosage forms (for patient convenience); when monotherapy with one component fails to achieve desired antihypertensive effect, or when dose-limiting adverse effects limit upward titration of monotherapy

Dosing: AdultsHypertension: Oral: Enalapril 5-20 mg and felodipine 2.5-10 mg once daily

Dosing: ElderlyRecommended initial dose of felodipine is 2.5 mg daily. Titration of individual components is preferred.

Dosing: Renal ImpairmentCl_{cr} <30 mL/minute: Recommended initial dose of enalapril is 2.5 mg/day. Titration of individual components is preferred.

Dosing: Hepatic ImpairmentRecommended initial dose of felodipine is 2.5 mg daily. Titration of individual components is preferred.

ContraindicationsHypersensitivity to felodipine, enalapril or any other component of the formulation; history of angioedema related to previous ACE inhibitor therapy; idiopathic or hereditary angioedema

Allergy Considerations

- ACE Inhibitor Allergy/Hypersensitivity
- Calcium Channel Blocker, Dihydropyridine Allergy

Warnings/Precautions

Boxed warnings:

- Pregnancy: See “Special populations” below.

Concerns related to adverse effects:

- Angina/MI: Increased angina and/or MI has occurred with initiation or dosage titration of dihydropyridine calcium channel blockers; reflex tachycardia may occur resulting in angina and/or MI in patients with obstructive coronary disease especially in the absence of concurrent beta-blockade.

- Angioedema: At any time during treatment (especially following first dose) angioedema may occur rarely with ACE inhibitors; it may involve the head and neck (potentially compromising airway) or the intestine (presenting with abdominal pain). African-Americans may be at an increased risk. Prolonged frequent monitoring may be required especially if tongue, glottis, or larynx are involved as they are associated with airway obstruction. Patients with a history of airway surgery may have a higher risk of airway obstruction. Aggressive early and appropriate management is critical. Use in patients with idiopathic or hereditary angioedema or previous angioedema associated with ACE inhibitor therapy is contraindicated.

- Cholestatic jaundice: A rare toxicity associated with ACE inhibitors includes cholestatic jaundice, which may progress to fulminant hepatic necrosis; discontinue if marked elevation of hepatic transaminases or jaundice occurs.

- Cough: An ACE inhibitor cough is a dry, hacking, nonproductive one that usually occurs within the first few months of treatment and should generally resolve within 1-4 weeks after discontinuation of the ACE inhibitor. Other causes of cough should be considered (eg, pulmonary congestion in patients with heart failure) and excluded prior to discontinuation.

- Hyperkalemia: May occur with ACE inhibitors; risk factors include renal dysfunction, diabetes mellitus, concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salts. Use cautiously, if at all, with these agents and monitor potassium closely.

- Hypersensitivity reactions: Anaphylactic/anaphylactoid reactions can occur with ACE inhibitors. Severe anaphylactoid reactions may be seen during hemodialysis (eg, CVVHD) with high-flux dialysis membranes (eg, AN69), and rarely, during low density lipoprotein apheresis with dextran sulfate cellulose. Rare cases of anaphylactoid reactions have been reported in patients undergoing sensitization treatment with hymenoptera (bee, wasp) venom while receiving ACE inhibitors.

- Hypotension/syncope: Symptomatic hypotension with or without syncope can occur with ACE inhibitors (usually with the first several doses); effects are most often observed in volume depleted patients; correct volume depletion prior to initiation; close monitoring of patient is required especially with initial dosing and dosing increases; blood pressure must be lowered at a rate appropriate for the patient's clinical condition. Although dose reduction may be necessary, hypotension is not a reason for discontinuation of future ACE inhibitor use especially in patients with heart failure where a reduction in systolic blood pressure is a desirable observation.

- Neutropenia/agranulocytosis: Another ACE inhibitor, captopril, has been associated with rare cases of agranulocytosis, neutropenia, or leukopenia with myeloid hypoplasia. Patients with renal impairment are at high risk of developing neutropenia. Patients with both renal impairment and collagen vascular disease (eg, systemic lupus erythematosus) are at an even higher risk of developing neutropenia. Periodically monitor CBC with differential in these patients.

- Peripheral edema: The most common side effect of felodipine (dose dependent) is peripheral edema; occurs within 2-3 weeks of starting therapy.

- Renal function deterioration: May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.

Disease-related concerns:

- Aortic stenosis: Use with extreme caution in patients with severe aortic stenosis; may reduce coronary perfusion resulting in ischemia.

- Cardiovascular disease: Initiation of therapy in patients with ischemic heart disease or cerebrovascular disease warrants close observation due to the potential consequences posed by falling blood pressure (eg, MI, stroke). Fluid replacement, if needed, may restore blood pressure; therapy may then be resumed. Discontinue therapy in patients whose hypotension recurs.

- Collagen vascular disease: Use enalapril with caution in patients with collagen vascular disease especially with concomitant renal impairment; may be at increased risk for hematologic toxicity.

- Heart failure: Use with caution in patients with heart failure. Safety and efficacy has not been established.

- Hepatic impairment: Use caution in patients with severe hepatic impairment; in cirrhosis, avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy.

- Hypercholesterolemia: Use with caution in patients with moderate or high cholesterol concentrations; increased cholesterol and triglyceride levels have been reported with thiazides.

- Hypertrophic cardiomyopathy (HCM) with outflow tract obstruction: Use with caution in patients with HCM and outflow tract obstruction since reduction in afterload may worsen symptoms associated with this condition.

- Renal artery stenosis: Use enalapril with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.

- Renal impairment: Use ACE inhibitors with caution in pre-existing renal insufficiency; dosage adjustment may be needed. Avoid rapid dosage escalation which may lead to further renal impairment.

Special populations:

- Elderly: Felodipine should be initiated at lower doses in elderly patients.

- Pediatrics: Safety and efficacy have not been established in children.

- Pregnancy: **[U.S. Boxed Warning]: Based on human data, ACEIs can cause injury and death to the developing fetus when used in the second and third trimesters. ACEIs should be discontinued as soon as possible once pregnancy is detected.**

Other warnings/precautions:

- Surgery: Use with caution before, during, or immediately after major surgery. Cardiopulmonary bypass, intraoperative blood loss, or vasodilating anesthesia increases endogenous renin release. Use of ACE inhibitors perioperatively will blunt angiotensin II formation and may result in hypotension.

Pregnancy Risk FactorC/D (2nd and 3rd trimesters)
Pregnancy ConsiderationsSee Enalapril monograph.
LactationEnters breast milk/use caution
Adverse ReactionsSee individual agents.
Metabolism/Transport Effects

Enalapril: **Substrate** of CYP3A4 (minor)

Felodipine: **Substrate** of CYP3A4 (major); **Inhibits** CYP2C8 (moderate), 2C9 (weak), 2D6 (weak), 3A4 (weak)

Drug Interactions

Allopurinol: ACE Inhibitors may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. *Risk D: Consider therapy modification*

Alpha1-Blockers: May enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Angiotensin II Receptor Blockers: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Antacids: May decrease the serum concentration of ACE Inhibitors. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Aprotinin: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

AzaTHIOprine: ACE Inhibitors may enhance the neutropenic effect of AzaTHIOprine. *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Nondihydropyridine): May enhance the hypotensive effect of Calcium Channel Blockers (Dihydropyridine). Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). *Risk C: Monitor therapy*

Calcium Salts: May diminish the therapeutic effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Calcium Channel Blockers (Dihydropyridine). *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Clopidogrel: Calcium Channel Blockers may diminish the therapeutic effect of Clopidogrel. *Risk C: Monitor therapy*

CycloSPORINE: ACE Inhibitors may enhance the nephrotoxic effect of CycloSPORINE. *Risk D: Consider therapy modification*

CycloSPORINE: May decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). Nicardipine may likewise inhibit the metabolism of cyclosporine. Cyclosporine dosage adjustments might be needed. *Risk C: Monitor therapy*

CYP2C8 Substrates (High risk): CYP2C8 Inhibitors (Moderate) may decrease the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Eplerenone: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Ferric Gluconate: ACE Inhibitors may enhance the adverse/toxic effect of Ferric Gluconate. *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Gold Sodium Thiomalate: ACE Inhibitors may enhance the adverse/toxic effect of Gold Sodium Thiomalate. An increased risk of nitritoid reactions has been appreciated. *Risk C: Monitor therapy*

Grapefruit Juice: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: ACE Inhibitors may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Loop Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Calcium Channel Blockers. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Magnesium Salts: Calcium Channel Blockers may enhance the adverse/toxic effect of Magnesium Salts. Magnesium Salts may enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nafcillin: May increase the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents (Nondepolarizing): Calcium Channel Blockers may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). *Risk C: Monitor therapy*

Nitroprusside: Calcium Channel Blockers may enhance the hypotensive effect of Nitroprusside. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Phenytoin: Calcium Channel Blockers may decrease the metabolism of Phenytoin. *Risk D: Consider therapy modification*

Potassium Salts: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). *Risk D: Consider therapy modification*

Quinupristin: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Calcium Channel Blockers. This primarily affects oral forms of calcium channel blockers. *Risk D: Consider therapy modification*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Salicylates: May diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Sirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Tacrolimus: Calcium Channel Blockers (Dihydropyridine) may increase the serum concentration of Tacrolimus. *Risk C: Monitor therapy*

Temsirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Thiazide Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Trimethoprim: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Monitoring ParametersBlood pressure; serum creatinine and potassium; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential

Nursing: Physical Assessment/MonitoringSee individual agents.

Monitoring: Lab TestsSerum creatinine and potassium; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential

Tablet, controlled release (Lexxel)

5-5 mg (30): $71.38

Mechanism of ActionSee individual agents.

Pharmacodynamics/KineticsSee individual agents.

Related Information

- Enalapril
- Felodipine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Gingival hyperplasia (fewer reports with felodipine than with other CCBs); resolves upon discontinuation (consultation with physician is suggested).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness and dizziness; rarely may cause nervousness, insomnia, confusion, or depression

Mental Health: Effects on Psychiatric TreatmentMay rarely cause agranulocytosis; use caution with clozapine and carbamazepine; may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels; carbamazepine may decrease felodipine effect

Cardiovascular ConsiderationsCombination therapy for the treatment of hypertension should be individualized for each patient. Potential advantages for enalapril and felodipine combination therapy may include improved compliance and synergistic reductions in blood pressure with an accompanied reduction in side effects. ACE inhibitors are standard therapy for left ventricular systolic dysfunction. Felodipine has neutral effects on mortality in this setting and therefore may be considered for the treatment of hypertension or angina in patients with heart failure.

Index TermsEnalapril Maleate and Felodipine; Felodipine and Enalapril

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(e NAL a pril & hye droe klor oh THYE a zide)

U.S. Brand NamesVaseretic®

Canadian Brand NamesVaseretic®

Pharmacologic CategoryAngiotensin-Converting Enzyme (ACE) Inhibitor; Diuretic, Thiazide

Use: Labeled IndicationsTreatment of hypertension

Dosing: AdultsHypertension: Oral: Enalapril 5-10 mg and hydrochlorothiazide 12.5-25 mg once daily (maximum: 40 mg/day [enalapril]; 50 mg/day [hydrochlorothiazide])

Dosing: ElderlyRefer to dosing in individual monographs; adjust for renal impairment.

Dosing: Renal Impairment

Cl_{cr} >30 mL/minute: Administer usual dose.

Severe renal failure: Avoid; loop diuretics are recommended.

ContraindicationsHypersensitivity to enalapril, hydrochlorothiazide, sulfonamide-derived drugs, or any component of the formulation; angioedema related to previous treatment with an ACE inhibitor; patients with hereditary or idiopathic angioedema; anuria

Allergy Considerations

- ACE Inhibitor Allergy/Hypersensitivity
- Thiazide/Thiazide-Related Diuretic Allergy

Warnings/Precautions

Boxed warnings:

- Pregnancy: See “Special populations” below.

Concerns related to adverse effects:

- Angioedema: At any time during treatment (especially following first dose) angioedema may occur rarely with ACE inhibitors; it may involve the head and neck (potentially compromising airway) or the intestine (presenting with abdominal pain). African-Americans may be at an increased risk. Prolonged frequent monitoring may be required especially if tongue, glottis, or larynx are involved as they are associated with airway obstruction. Patients with a history of airway surgery may have a higher risk of airway obstruction. Aggressive early and appropriate management is critical. Use in patients with idiopathic or hereditary angioedema or previous angioedema associated with ACE inhibitor therapy is contraindicated.

- Cholestatic jaundice: A rare toxicity associated with ACE inhibitors includes cholestatic jaundice, which may progress to fulminant hepatic necrosis; discontinue if marked elevation of hepatic transaminases or jaundice occurs.

- Cough: An ACE inhibitor cough is a dry, hacking, nonproductive one that usually occurs within the first few months of treatment and should generally resolve within 1-4 weeks after discontinuation of the ACE inhibitor. Other causes of cough should be considered (eg, pulmonary congestion in patients with heart failure) and excluded prior to discontinuation.

- Electrolyte disturbances: Hyperkalemia may occur with ACE inhibitors; risk factors include renal dysfunction, diabetes mellitus, and concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salts. Use cautiously, if at all, with these agents and monitor potassium closely. Thiazide diuretics may cause hypokalemia, hypochloremic alkalosis, hypomagnesemia, and hyponatremia.

- Hypersensitivity reactions: Anaphylactic/anaphylactoid reactions can occur with ACE inhibitors. Severe anaphylactoid reactions may be seen during hemodialysis (eg, CVVHD) with high-flux dialysis membranes (eg, AN69), and rarely, during low density lipoprotein apheresis with dextran sulfate cellulose. Rare cases of anaphylactoid reactions have been reported in patients undergoing sensitization treatment with hymenoptera (bee, wasp) venom while receiving ACE inhibitors.

- Hypotension/syncope: Symptomatic hypotension with or without syncope can occur with ACE inhibitors (usually with the first several doses); effects are most often observed in volume depleted patients; correct volume depletion prior to initiation; close monitoring of patient is required especially with initial dosing and dosing increases; blood pressure must be lowered at a rate appropriate for the patient's clinical condition. Although dose reduction may be necessary, hypotension is not a reason for discontinuation of future ACE inhibitor use especially in patients with heart failure where a reduction in systolic blood pressure is a desirable observation.

- Neutropenia/agranulocytosis: Another ACE inhibitor, captopril, has been associated with rare cases of agranulocytosis, neutropenia, or leukopenia with myeloid hypoplasia. Patients with renal impairment are at high risk of developing neutropenia. Patients with both renal impairment and collagen vascular disease (eg, systemic lupus erythematosus) are at an even higher risk of developing neutropenia. Periodically monitor CBC with differential in these patients.

- Photosensitivity: Photosensitization may occur.

- Renal function deterioration: May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.

- Sulfa allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe. Discontinue if signs of hypersensitivity are noted.

Disease-related concerns:

- Aortic stenosis: Use with caution in patients with severe aortic stenosis; may reduce coronary perfusion resulting in ischemia.

- Cardiovascular disease: Initiation of therapy in patients with ischemic heart disease or cerebrovascular disease warrants close observation due to the potential consequences posed by falling blood pressure (eg, MI, stroke). Fluid replacement, if needed, may restore blood pressure; therapy may then be resumed. Discontinue therapy in patients whose hypotension recurs.

- Collagen vascular disease: Use enalapril with caution in patients with collagen vascular disease especially with concomitant renal impairment; may be at increased risk for hematologic toxicity. Hydrochlorothiazide can cause systemic lupus erythematosus (SLE) exacerbation or activation.

- Diabetes: Use hydrochlorothiazide with caution in patients with prediabetes or diabetes mellitus; may see a change in glucose control.

- Gout: In certain patients with a history of gout, a familial predisposition to gout, or chronic renal failure, gout can be precipitated by hydrochlorothiazide.

- Hepatic impairment: Use caution in patients with severe hepatic impairment; in cirrhosis, avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy.

- Hypercholesterolemia: Use with caution in patients with moderate or high cholesterol concentrations; increased cholesterol and triglyceride levels have been reported with thiazides.

- Hypertrophic cardiomyopathy (HCM) with outflow tract obstruction: Use with caution in patients with HCM and outflow tract obstruction since reduction in afterload may worsen symptoms associated with this condition.

- Renal artery stenosis: Use enalapril with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.

- Renal impairment: Use ACE inhibitors with caution in pre-existing renal insufficiency; dosage adjustment may be needed. Avoid rapid dosage escalation which may lead to further renal impairment. Avoid hydrochlorothiazide in severe renal disease (ineffective). Contraindicated in anuric patients.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

- Pregnancy: **[U.S. Boxed Warning]: Based on human data, ACEIs can cause injury and death to the developing fetus when used in the second and third trimesters. ACEIs should be discontinued as soon as possible once pregnancy is detected.**

Other warnings/precautions:

- Surgery: Use with caution before, during, or immediately after major surgery. Cardiopulmonary bypass, intraoperative blood loss or vasodilating anesthesia increases endogenous renin release. Use of ACE inhibitors perioperatively will blunt angiotensin II formation and may result in hypotension.

Pregnancy Risk FactorC/D (2nd and 3rd trimesters)
Pregnancy Considerations**U.S. Boxed Warning: Based on human data, ACEIs can cause injury and death to the developing fetus when used in the second and third trimesters. ACEIs should be discontinued as soon as possible once pregnancy is detected.** See individual agents.
LactationEnters breast milk (both ingredients)/compatible
Adverse ReactionsSee individual agents.
Metabolism/Transport EffectsEnalapril: **Substrate** of CYP3A4 (major)
Drug Interactions

ACE Inhibitors: Thiazide Diuretics may enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: ACE Inhibitors may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. *Risk D: Consider therapy modification*

Allopurinol: Thiazide Diuretics may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. Thiazide Diuretics may increase the serum concentration of Allopurinol. Specifically, Thiazide Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Angiotensin II Receptor Blockers: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Antacids: May decrease the serum concentration of ACE Inhibitors. *Risk C: Monitor therapy*

Aprotinin: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

AzaTHIOprine: ACE Inhibitors may enhance the neutropenic effect of AzaTHIOprine. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Thiazide Diuretics. The diuretic response is likewise decreased. *Risk D: Consider therapy modification*

Calcitriol: Thiazide Diuretics may enhance the hypercalcemic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Salts: Thiazide Diuretics may decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

CycloSPORINE: ACE Inhibitors may enhance the nephrotoxic effect of CycloSPORINE. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dofetilide: Thiazide Diuretics may enhance the QTc-prolonging effect of Dofetilide. Thiazide Diuretics may increase the serum concentration of Dofetilide. *Risk D: Consider therapy modification*

Eplerenone: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Ferric Gluconate: ACE Inhibitors may enhance the adverse/toxic effect of Ferric Gluconate. *Risk C: Monitor therapy*

Gold Sodium Thiomalate: ACE Inhibitors may enhance the adverse/toxic effect of Gold Sodium Thiomalate. An increased risk of nitritoid reactions has been appreciated. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: Thiazide Diuretics may decrease the excretion of Lithium. *Risk D: Consider therapy modification*

Lithium: ACE Inhibitors may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Loop Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Potassium Salts: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Salicylates: May diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Sirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Temsirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Thiazide Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Trimethoprim: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Monitoring ParametersBlood pressure; BUN, serum creatinine, and electrolytes; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential
Nursing: Physical Assessment/MonitoringSee individual agents.
Monitoring: Lab TestsBUN, serum creatinine, and electrolytes; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential
Patient EducationSee individual agents.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

5/12.5: Enalapril maleate 5 mg and hydrochlorothiazide 12.5 mg

10/25: Enalapril maleate 10 mg and hydrochlorothiazide 25 mg

Vaseretic®:

10/25: Enalapril maleate 10 mg and hydrochlorothiazide 25 mg

Generic AvailableYes

ManufacturerMerck & Co

Pricing: U.S. (www.drugstore.com)

Tablets (Enalapril-Hydrochlorothiazide)

5-12.5 mg (30): $23.99

10-25 mg (30): $26.99

Tablets (Vaseretic)

5-12.5 mg (30): $42.34

10-25 mg (30): $85.95

Related Information

- Enalapril
- Hydrochlorothiazide

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness and dizziness; rarely may cause insomnia, confusion, and depression

Mental Health: Effects on Psychiatric TreatmentMay rarely cause agranulocytosis; use caution with clozapine and carbamazepine; may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels

Cardiovascular ConsiderationsCombination therapy for the treatment of hypertension should be individualized for each patient. Potential advantages for enalapril and hydrochlorothiazide combination therapy may include improved compliance and synergistic reductions in blood pressure with an accompanied reduction in side effects. ACE inhibitors and thiazides are also standard therapy for left ventricular systolic dysfunction. See Cardiovascular Considerations for individual agents.

Index TermsEnalapril Maleate and Hydrochlorothiazide; Hydrochlorothiazide and Enalapril

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Enalapril may be confused with Anafranil®, Elavil®, Eldepryl®, nafarelin, ramipril

Significant differences exist between oral and I.V. dosing. Use caution when converting from one route of administration to another.

International issues:

Acepril® [Hungary, Switzerland] may be confused with Accupril® which is a brand name for quinapril in the U.S.

Acepril®: Brand name for lisinopril in Denmark; brand name for captopril in Great Britain

Nacor® [Spain] may be confused with Niacor® which is a brand name for niacin in the U.S.

Pronunciation(e NAL a pril)

U.S. Brand NamesVasotec®

Canadian Brand NamesApo-Enalapril®; CO Enalapril; Gen-Enalapril; Novo-Enalapril; PMS-Enalapril; Pro-Enalapril; ratio-Enalapril; Riva-Enalapril; Sandoz-Enalapril; Taro-Enalapril; Vasotec®; Vasotec® I.V.

Pharmacologic CategoryAngiotensin-Converting Enzyme (ACE) Inhibitor

Use: Labeled IndicationsTreatment of hypertension; treatment of symptomatic heart failure; treatment of asymptomatic left ventricular dysfunction

Use: Unlabeled/Investigational

Unlabeled: To delay the progression of nephropathy and reduce risks of cardiovascular events in hypertensive patients with type 1 or 2 diabetes mellitus; hypertensive crisis, diabetic nephropathy, hypertension secondary to scleroderma renal crisis, diagnosis of aldosteronism, idiopathic edema, Bartter's syndrome, postmyocardial infarction for prevention of ventricular failure

Investigational: Severe congestive heart failure in infants, neonatal hypertension, acute cardiogenic pulmonary edema (enalaprilat)

Dosing: AdultsUse lower listed initial dose in patients with hyponatremia, hypovolemia, severe congestive heart failure, decreased renal function, or in those receiving diuretics.

Asymptomatic left ventricular dysfunction: Oral: 2.5 mg twice daily, titrated as tolerated to 20 mg/day

Hypertension:

Oral: 2.5-5 mg/day then increase as required, usually at 1- to 2-week intervals; usual dose range (JNC 7): 2.5-40 mg/day in 1-2 divided doses. **Note:** Initiate with 2.5 mg if patient is taking a diuretic which cannot be discontinued. May add a diuretic if blood pressure cannot be controlled with enalapril alone.

I.V. (Enalaprilat): 1.25 mg/dose, given over 5 minutes every 6 hours; doses as high as 5 mg/dose every 6 hours have been tolerated for up to 36 hours. **Note:** If patients are concomitantly receiving diuretic therapy, begin with 0.625 mg I.V. over 5 minutes; if the effect is not adequate after 1 hour, repeat the dose and administer 1.25 mg at 6-hour intervals thereafter; if adequate, administer 0.625 mg I.V. every 6 hours.

Heart failure:

Oral: Initial: 2.5 mg once or twice daily (usual range: 5-40 mg/day in 2 divided doses). Titrate slowly at 1- to 2-week intervals. Target dose: 10-20 mg twice daily (ACC/AHA 2005 Heart Failure Guidelines)

I.V.: Avoid I.V. administration in patients with unstable heart failure or those suffering acute myocardial infarction.

Conversion from I.V. to oral therapy if not concurrently on diuretics: 5 mg once daily; subsequent titration as needed; if concurrently receiving diuretics and responding to 0.625 mg I.V. every 6 hours, initiate with 2.5 mg/day.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Hypertension: Oral: Children 1 month to 17 years: Initial: 0.08 mg/kg/d (up to 5 mg) in 1-2 divided doses; adjust dosage based on patient response; doses >0.58 mg/kg (40 mg) have not been evaluated in pediatric patients

Heart failure (non-FDA approved):

Infants and Children:

Oral (Enalapril): Initial: 0.1 mg/kg/day in 1-2 divided doses; increase as required over 2 weeks to maximum of 0.5 mg/kg/day; mean dose required for CHF improvement in 39 children (9 days to 17 years) was 0.36 mg/kg/day; investigationally, select individuals have been treated with doses up to 0.94 mg/kg/day

I.V. (Enalaprilat): 5-10 mcg/kg/dose administered every 8-24 hours (as determined by blood pressure readings); monitor patients carefully; select patients may require higher doses

Adolescents: Refer to adult dosing.

Dosing: Renal Impairment

Oral: Enalapril: Hypertension:

Cl_{cr} 30-80 mL/minute: Administer 5 mg/day titrated upwards to maximum of 40 mg.

Cl_{cr} <30 mL/minute: Administer 2.5 mg day titrated upward until blood pressure is controlled up to a maximum of 40 mg.

For heart failure patients with sodium <130 mEq/L or serum creatinine >1.6 mg/dL, initiate dosage with 2.5 mg/day, increasing to twice daily as needed; increase further in increments of 2.5 mg/dose at >4-day intervals to a maximum daily dose of 40 mg.

I.V.: Enalaprilat:

Cl_{cr} >30 mL/minute: Initiate with 1.25 mg every 6 hours and increase dose based on response.

Cl_{cr} <30 mL/minute: Initiate with 0.625 mg every 6 hours and increase dose based on response.

Moderately dialyzable (20% to 50%)

Administer dose postdialysis (eg, 0.625 mg I.V. every 6 hours) or administer 20% to 25% supplemental dose following dialysis; Clearance: 62 mL/minute

Peritoneal dialysis effects: Supplemental dose is not necessary, although some removal of drug occurs.

Dosing: Hepatic ImpairmentHydrolysis of enalapril to enalaprilat may be delayed and/or impaired in patients with severe hepatic impairment, but the pharmacodynamic effects of the drug do not appear to be significantly altered. No dosage adjustment is necessary.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V.Give direct IVP over at least 5 minutes or dilute up to 50 mL and infuse.

Dietary ConsiderationsLimit salt substitutes or potassium-rich diet.

StorageEnalaprilat: Clear, colorless solution which should be stored at <30°C. I.V. is stable for 24 hours at room temperature in D_5W or NS.

CompatibilityStable in dextran 40 10% in dextrose, D_5LR, D_5NS, D_5W, hetastarch 6%, NS.

Y-site administration: Compatible: Allopurinol, amifostine, amikacin, aminophylline, ampicillin, ampicillin/sulbactam, aztreonam, butorphanol, calcium gluconate, cefazolin, cefoperazone, ceftazidime, ceftizoxime, chloramphenicol, cimetidine, cisatracurium, cladribine, clindamycin, dextran 40, dobutamine, docetaxel, dopamine, doxorubicin liposome, erythromycin lactobionate, esmolol, etoposide, famotidine, fentanyl, filgrastim, ganciclovir, gatifloxacin, gemcitabine, gentamicin, granisetron, heparin, hetastarch, hydrocortisone sodium succinate, labetalol, lidocaine, linezolid, magnesium sulfate, melphalan, meropenem, methylprednisolone sodium succinate, metronidazole, morphine, nafcillin, nicardipine, penicillin G potassium, phenobarbital, piperacillin, piperacillin/tazobactam, potassium chloride, potassium phosphates, propofol, ranitidine, remifentanil, sodium acetate, sodium nitroprusside, teniposide, thiotepa, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vinorelbine. **Incompatible:** Amphotericin B, amphotericin B cholesteryl sulfate complex, cefepime, phenytoin.

Compatibility when admixed: Compatible: Dobutamine, dopamine, heparin, meropenem, nitroglycerin, potassium chloride, sodium nitroprusside.

Extemporaneously Prepared

An enalapril oral suspension (0.2 mg/mL) has been made using one 2.5 mg tablet and 12.5 mL sterile water; stability unknown; suspension should be used immediately and the remaining amount discarded

Young TE and Mangum OB, “Neofax®, '95: A Manual of Drugs Used in Neonatal Care,” 8th ed, Columbus, OH: Ross Products Division, Abbott Laboratories, 1995, 85.

An enalapril oral suspension (1 mg/mL) has been made using 20 mg tablets and Bicitra®. Add 50 mL Bicitra® to a polyethylene terephthalate (PET) bottle containing ten 20 mg tablets and shake for at least 2 minutes. Let concentrate stand for 60 minutes. Following the 60-minute hold time, shake the concentration for an additional minute. Add 150 mL Bicitra® to the concentrate and shake the suspension to disperse the ingredients. The suspension should refrigerated at 2°C to 8°C (36°F to 46°F); it can be stored for up to 30 days. Shake suspension well before use.

Package labeling, Merck & Co, Inc, issued October 2000.

ContraindicationsHypersensitivity to enalapril or enalaprilat; angioedema related to previous treatment with an ACE inhibitor; patients with idiopathic or hereditary angioedema

Allergy Considerations

- ACE Inhibitor Allergy/Hypersensitivity

Warnings/Precautions

Boxed warnings:

- Pregnancy: See “Special populations” below.

Concerns related to adverse effects:

- Angioedema: At any time during treatment (especially following first dose) angioedema may occur rarely with ACE inhibitors; it may involve the head and neck (potentially compromising airway) or the intestine (presenting with abdominal pain). African-Americans may be at an increased risk. Prolonged frequent monitoring may be required especially if tongue, glottis, or larynx are involved as they are associated with airway obstruction. Patients with a history of airway surgery may have a higher risk of airway obstruction. Aggressive early and appropriate management is critical. Use in patients with idiopathic or hereditary angioedema or previous angioedema associated with ACE inhibitor therapy is contraindicated.

- Cholestatic jaundice: A rare toxicity associated with ACE inhibitors includes cholestatic jaundice, which may progress to fulminant hepatic necrosis; discontinue if marked elevation of hepatic transaminases or jaundice occurs.

- Cough: An ACE inhibitor cough is a dry, hacking, nonproductive one that usually occurs within the first few months of treatment and should generally resolve within 1-4 weeks after discontinuation of the ACE inhibitor. Other causes of cough should be considered (eg, pulmonary congestion in patients with heart failure) and excluded prior to discontinuation.

- Hyperkalemia: May occur with ACE inhibitors; risk factors include renal dysfunction, diabetes mellitus, concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salts. Use cautiously, if at all, with these agents and monitor potassium closely.

- Hypersensitivity reactions: Anaphylactic/anaphylactoid reactions can occur with ACE inhibitors. Severe anaphylactoid reactions may be seen during hemodialysis (eg, CVVHD) with high-flux dialysis membranes (eg, AN69), and rarely, during low density lipoprotein apheresis with dextran sulfate cellulose. Rare cases of anaphylactoid reactions have been reported in patients undergoing sensitization treatment with hymenoptera (bee, wasp) venom while receiving ACE inhibitors.

- Hypotension/syncope: Symptomatic hypotension with or without syncope can occur with ACE inhibitors (usually with the first several doses); effects are most often observed in volume-depleted patients; correct volume depletion prior to initiation; close monitoring of patient is required especially with initial dosing and dosing increases; blood pressure must be lowered at a rate appropriate for the patient's clinical condition. Although dose reduction may be necessary, hypotension is not a reason for discontinuation of future ACE inhibitor use especially in patients with heart failure where a reduction in systolic blood pressure is a desirable observation.

- Neutropenia/agranulocytosis: Another ACE inhibitor, captopril, has been associated with rare cases of agranulocytosis, neutropenia, or leukopenia with myeloid hypoplasia. Patients with renal impairment are at high risk of developing neutropenia. Patients with both renal impairment and collagen vascular disease (eg, systemic lupus erythematosus) are at an even higher risk of developing neutropenia. Periodically monitor CBC with differential in these patients.

- Renal function deterioration: May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.

Disease-related concerns:

- Aortic stenosis: Use with caution in patients with severe aortic stenosis; may reduce coronary perfusion resulting in ischemia.

- Cardiovascular disease: Initiation of therapy in patients with ischemic heart disease or cerebrovascular disease warrants close observation due to the potential consequences posed by falling blood pressure (eg, MI, stroke). Fluid replacement, if needed, may restore blood pressure; therapy may then be resumed. Discontinue therapy in patients whose hypotension recurs.

- Collagen vascular disease: Use with caution in patients with collagen vascular disease especially with concomitant renal impairment; may be at increased risk for hematologic toxicity.

- Hypertrophic cardiomyopathy (HCM) with outflow tract obstruction: Use with caution in patients with HCM and outflow tract obstruction since reduction in afterload may worsen symptoms associated with this condition.

- Renal artery stenosis: Use with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.

- Renal impairment: Use with caution in pre-existing renal insufficiency; dosage adjustment may be needed. Avoid rapid dosage escalation which may lead to further renal impairment.

Special populations:

- Pregnancy: **[U.S. Boxed Warning]: Based on human data, ACEIs can cause injury and death to the developing fetus when used in the second and third trimesters. ACEIs should be discontinued as soon as possible once pregnancy is detected.**

Other warnings/precautions:

- Surgery: Use with caution before, during, or immediately after major surgery. Cardiopulmonary bypass, intraoperative blood loss or vasodilating anesthesia increases endogenous renin release. Use of ACE inhibitors perioperatively will blunt angiotensin II formation and may result in hypotension.

Geriatric ConsiderationsDue to frequent decreases in glomerular filtration (also creatinine clearance) with aging, elderly patients may have exaggerated responses to ACE inhibitors; differences in clinical response due to hepatic changes are not observed. ACE inhibitors may be preferred agents in elderly patients with congestive heart failure and diabetes mellitus. Diabetic proteinuria is reduced and insulin sensitivity is enhanced. In general, the side effect profile is favorable in the elderly and causes little or no CNS confusion; use lowest dose recommendations initially; adjust dose for renal function in the elderly. Many elderly may be volume depleted due to diuretic use and/or blunted thirst reflex resulting in inadequate fluid intake.

Pregnancy Risk FactorC (1st trimester); D (2nd and 3rd trimesters)

Pregnancy ConsiderationsDue to adverse events observed in some animal studies, enalapril is considered pregnancy category C during the first trimester. Based on human data, enalapril is considered pregnancy category D if used during the second and third trimesters (per the manufacturer; however, one study suggests that fetal injury may occur at anytime during pregnancy). Enalaprilat, the active metabolite of enalapril, crosses the placenta. First trimester exposure to ACE inhibitors may cause major congenital malformations. An increased risk of cardiovascular and/or central nervous system malformations was observed in one study; however, an increased risk of teratogenic events was not observed in other studies. Second and third trimester use of an ACE inhibitor is associated with oligohydramnios. Oligohydramnios due to decreased fetal renal function may lead to fetal limb contractures, craniofacial deformation, and hypoplastic lung development. The use of ACE inhibitors during the second and third trimesters is also associated with anuria, hypotension, renal failure (reversible or irreversible), skull hypoplasia, and death in the fetus/neonate. Chronic maternal hypertension itself is also associated with adverse events in the fetus/infant. ACE inhibitors are not recommended during pregnancy to treat maternal hypertension or heart failure. Those who are planning a pregnancy should be considered for other medication options if an ACE inhibitor is currently prescribed or the ACE inhibitor should be discontinued as soon as possible once pregnancy is detected. The exposed fetus should be monitored for fetal growth, amniotic fluid volume, and organ formation. Infants exposed to an ACE inhibitor *in utero*, especially during the second and third trimester, should be monitored for hyperkalemia, hypotension, and oliguria.

[U.S. Boxed Warning]: Based on human data, ACE inhibitors can cause injury and death to the developing fetus when used in the second and third trimesters. ACE inhibitors should be discontinued as soon as possible once pregnancy is detected.

LactationEnters breast milk/not recommended (AAP rates “compatible”)

Breast-Feeding ConsiderationsEnalapril and enalaprilat are excreted in breast milk. Breast-feeding is not recommended by the manufacturer. The AAP considers enalapril to be “usually compatible with breast-feeding.”

Pregnancy & Lactation, In-Depth

- Enalapril in Pregnancy & Lactation

Adverse Reactions**Note:** Frequency ranges include data from hypertension and heart failure trials. Higher rates of adverse reactions have generally been noted in patients with CHF. However, the frequency of adverse effects associated with placebo is also increased in this population.

1% to 10%:

Cardiovascular: Hypotension (0.9% to 7%), chest pain (2%), syncope (0.5% to 2%), orthostasis (2%), orthostatic hypotension (2%)

Central nervous system: Headache (2% to 5%), dizziness (4% to 8%), fatigue (2% to 3%)

Dermatologic: Rash (2%)

Gastrointestinal: Abnormal taste, abdominal pain, vomiting, nausea, diarrhea, anorexia, constipation

Neuromuscular & skeletal: Weakness

Renal: Serum creatinine increased (0.2% to 20%), worsening of renal function (in patients with bilateral renal artery stenosis or hypovolemia)

Respiratory (1% to 2%): Bronchitis, cough, dyspnea

<1% (Limited to important or life-threatening): Agranulocytosis, alopecia, anaphylactoid reaction, angina pectoris, angioedema, ataxia, atrial fibrillation, atrial tachycardia, bone marrow suppression, bradycardia, bronchospasm, cardiac arrest, cerebral vascular accident, cholestatic jaundice, depression, eosinophilic pneumonitis, erythema multiforme, exfoliative dermatitis, flushing, giant cell arteritis, gynecomastia, hallucinations, hemolysis with G6PD, Henoch-Schönlein purpura, hepatitis, ileus, impotence, jaundice, lichen-form reaction, melena, MI, neutropenia, ototoxicity, pancreatitis, paresthesia, pemphigus, pemphigus foliaceus, peripheral neuropathy, photosensitivity, psychosis, pulmonary edema, pulmonary embolism, pulmonary infiltrates, Raynaud’s phenomenon, sicca syndrome, somnolence, Stevens-Johnson syndrome, systemic lupus erythematosus, thrombocytopenia, toxic epidermal necrolysis, toxic pustuloderma, vertigo.

A syndrome which may include arthralgia, elevated ESR, eosinophilia and positive ANA, fever, interstitial nephritis, myalgia, rash, and vasculitis has been reported for enalapril and other ACE inhibitors.

Metabolism/Transport Effects**Substrate** of CYP3A4 (minor)

Drug Interactions

Allopurinol: ACE Inhibitors may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. *Risk D: Consider therapy modification*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Angiotensin II Receptor Blockers: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Antacids: May decrease the serum concentration of ACE Inhibitors. *Risk C: Monitor therapy*

Aprotinin: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

AzaTHIOprine: ACE Inhibitors may enhance the neutropenic effect of AzaTHIOprine. *Risk C: Monitor therapy*

CycloSPORINE: ACE Inhibitors may enhance the nephrotoxic effect of CycloSPORINE. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Eplerenone: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Ferric Gluconate: ACE Inhibitors may enhance the adverse/toxic effect of Ferric Gluconate. *Risk C: Monitor therapy*

Gold Sodium Thiomalate: ACE Inhibitors may enhance the adverse/toxic effect of Gold Sodium Thiomalate. An increased risk of nitritoid reactions has been appreciated. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: ACE Inhibitors may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Loop Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Potassium Salts: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Salicylates: May diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Sirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Temsirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Thiazide Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Trimethoprim: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid bayberry, blue cohosh, cayenne, ephedra, ginger, ginseng (American), kola, licorice (may worsen hypertension). Avoid black cohosh, california poppy, coleus, golden seal, hawthorn, mistletoe, periwinkle, quinine, shepherd's purse (may have increased antihypertensive effect).

Test InteractionsPositive Coombs' [direct]; may cause false-positive results in urine acetone determinations using sodium nitroprusside reagent

Monitoring ParametersBlood pressure; serum creatinine and potassium; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents or herbal products patient may be taking (especially anything that may impact fluid balance or cardiac status). **Infusion:** See Administration details. Blood pressure should be closely monitored with first dose or change in dose. Assess results of laboratory tests closely during first 3 months of therapy and regularly thereafter. Assess therapeutic effectiveness according to purpose for use and adverse response on a regular basis during therapy (eg, anaphylactic reaction, hypovolemia, angioedema, postural hypotension). Teach patient appropriate use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsSerum creatinine and potassium; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Do not use potassium supplement or salt substitutes without consulting prescriber. Take exactly as directed; do not discontinue without consulting prescriber. Take first dose at bedtime. Take all doses on an empty stomach, 1 hour before or 2 hours after meals. This drug does not eliminate need for diet or exercise regimen as recommended by prescriber. May cause dizziness, fainting, or lightheadedness (use caution when driving or engaging in tasks that require alertness until response to drug is known); postural hypotension (use caution when rising from lying or sitting position or climbing stairs); or nausea, vomiting, abdominal pain, dry mouth, or transient loss of appetite (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). Report persistent nausea and vomiting; chest pain or palpitations; mouth sores; fever or chills; swelling of extremities, face, mouth, or tongue; skin rash; numbness, tingling, or pain in muscles; respiratory difficulty or unusual cough; or other persistent adverse reactions. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant. This drug should not be used in the 2nd or 3rd trimester of pregnancy. Consult prescriber for appropriate contraceptive measures if necessary or if you suspect you might be pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as enalaprilat: 1.25 mg/mL (1 mL, 2 mL) [contains benzyl alcohol]

Tablet, as maleate (Vasotec®): 2.5 mg, 5 mg, 10 mg, 20 mg

Generic AvailableYes
ManufacturerMerck & Co
Pricing: U.S. (www.drugstore.com)

Tablets (Enalapril Maleate)

2.5 mg (30): $12.99

5 mg (30): $10.99

10 mg (30): $11.99

20 mg (30): $11.99

Tablets (Vasotec)

2.5 mg (60): $122.97

10 mg (30): $85.95

20 mg (30): $112.40

Mechanism of ActionCompetitive inhibitor of angiotensin-converting enzyme (ACE); prevents conversion of angiotensin I to angiotensin II, a potent vasoconstrictor; results in lower levels of angiotensin II which causes an increase in plasma renin activity and a reduction in aldosterone secretion
Pharmacodynamics/Kinetics

Onset of action: Oral: ~1 hour

Duration: Oral: 12-24 hours

Absorption: Oral: 55% to 75%

Protein binding: 50% to 60%

Metabolism: Prodrug, undergoes hepatic biotransformation to enalaprilat

Half-life elimination:

Enalapril: Adults: Healthy: 2 hours; Congestive heart failure: 3.4-5.8 hours

Enalaprilat: Infants 6 weeks to 8 months of age: 6-10 hours; Adults: 35-38 hours

Time to peak, serum: Oral: Enalapril: 0.5-1.5 hours; Enalaprilat (active): 3-4.5 hours

Excretion: Urine (60% to 80%); some feces

Related Information

- Angiotensin Agents
- Heart Failure (Systolic)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Abnormal taste and orthostatic hypotension
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause drowsiness and dizziness; rarely may cause insomnia, confusion, depression
Mental Health: Effects on Psychiatric TreatmentMay rarely cause agranulocytosis; use caution with clozapine and carbamazepine; may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels
Cardiovascular Considerations

Congestive Heart Failure: The ACC/AHA 2005 Heart Failure Guidelines recommend that ACE inhibitors be used in patients with a reduced EF (with or without heart failure symptoms) unless contraindicated. ACE inhibitors decrease morbidity and mortality in patients with asymptomatic and symptomatic left ventricular dysfunction. In this situation, they decrease hospitalizations for, and retard progression to, congestive heart failure. When used in patients with heart failure, the target dose should be achieved, if possible. Lower daily doses of ACE inhibitors have demonstrated the same mortality effects as high doses, but have not decreased hospitalizations to the extent that high-dose ACE inhibitors have, as demonstrated in the ATLAS study (Packer M, 1999).

Hypertension: The ALLHAT study (ALLHAT Collaborative Group, 2002) compared CV outcomes of lisinopril, amlodipine, or chlorthalidone in hypertensive patients having at least one other risk factor for coronary heart disease. Investigators found no difference between the groups on the primary outcome of fatal coronary disease or nonfatal MI. The ACC/AHA 2005 Heart Failure Guidelines suggest that ACE inhibitors or angiotensin receptor blockers (ARBs) can be beneficial in patients with hypertension and LVH without symptoms of heart failure. JNC 7 suggests that patients can benefit from treatment with an ACE inhibitor if they have hypertension **and** heart failure, acute myocardial infarction, high coronary disease risk, diabetes, chronic kidney disease, or history of stroke.

Vascular Disease: The ACC/AHA 2005 Heart Failure Guidelines suggest that ACE inhibitors can be useful in preventing heart failure in patients who have a history of atherosclerotic vascular disease, diabetes, or hypertension with associated cardiovascular risk factors. The HOPE trial (Heart Outcomes Prevention Evaluation Study Investigators, 2000) investigated the value of an ACE inhibitor (ramipril 5-10 mg daily) versus placebo in patients who had evidence of vascular disease or diabetes (one other cardiovascular risk factor) and were at least 55 years of age. Patients were excluded if they had a low ejection fraction, heart failure, or were on an ACE inhibitor. The primary outcome was a composite of death from cardiovascular cause, myocardial infarction, or stroke; 9297 patients were enrolled and randomized. Ramipril significantly reduced the risk of death from CV causes, MI, or stroke over placebo. New cases of diabetes were also reduced in the ramipril group. In the EUROPA trial, patients with stable coronary artery disease (at low risk for cardiovascular events) received perindopril or placebo and were evaluated for incidence of cardiovascular events after four years of treatment. In this randomized, placebo-controlled, prospective study, 12,218 patients received either perindopril (8 mg/day, n=6110) or placebo (n=6108) and were assessed for the primary endpoint of a cardiovascular event, defined as cardiovascular death, myocardial infarction, or cardiac arrest. The study population was well balanced with respect to baseline demographics and concomitant medication use (including beta-blockers, platelet inhibitors, antihyperlipidemics, calcium channel blockers, nitrates, and diuretics). Intent-to-treat analysis revealed that 603 (10%) of placebo patients experienced the primary endpoint of a cardiovascular event compared to 488 (8%) of perindopril-receiving patients, for a 20% relative risk reduction (p=0.0003). This result was not influenced by presence of other comorbidities (eg, diabetes, hypertension) or concomitant beta-blocker, calcium channel blocker, or lipid-lowering therapies. Withdrawal from the study (postrandomization) due to adverse reactions was similar between treatment groups. Number needed to treat analysis suggests that treatment of 50 patients over a 4-year period will prevent one major cardiovascular event.

Acute Coronary Syndromes: In the treatment of unstable angina/non-ST-segment elevation MI, ACE inhibitors are recommended when hypertension persists despite treatment with nitroglycerin and a beta-blocker in patients with LV systolic dysfunction or CHF and in ischemic patients with diabetes (Class I). ACE inhibitors are also recommended for all post-ACS individuals (Class IIa). According to 2004 ACC/AHA STEMI guidelines, an ACE inhibitor should be administered orally within the first 24 hours of STEMI to patients with anterior infarction, pulmonary congestion, or LVEF <0.4, in the absence of hypotension or known contraindications to this class of medicines. In the emergency management of complicated STEMI, a short-acting ACEI (eg, captopril 1-6.25 mg) may be added once the patient's systolic blood pressure is >100 mm Hg and not <30 mm Hg below baseline. The VALIANT trial evaluated the effects of valsartan (target dose: 160 mg twice daily), captopril (target dose: 50 mg twice daily), and the combination (target doses: valsartan 80 mg twice daily and captopril 150 mg once daily) in a randomized, double-blind trial of patients with acute MI (0.5-10 days post-MI) complicated by left ventricular systolic dysfunction, heart failure, or both. Enrollment in the study numbered 14,703 patients and followed for a median of 24.7 months. There was no difference in the primary endpoint (all cause mortality) among the 3 groups. There was no difference in incidence of CV death, recurrent MI, or hospitalization for heart failure either. Hypotension and renal dysfunction occurred significantly more often in the valsartan group than captopril alone. Cough, rash, and taste disturbances occurred more often in the captopril group. The authors (Pfeffer MA, 2003) concluded that valsartan is as effective as captopril in patients who are at high risk for cardiovascular events after MI. Combining valsartan with captopril increased the rate of adverse events without improving survival.

Potential Adverse Events: ACE inhibitor therapy may elicit rapid increases in potassium and creatinine, especially when used in patients with bilateral renal artery stenosis. When ACE inhibition is introduced in patients with pre-existing diuretic therapy who are hypovolemic, the ACE inhibitor may induce acute hypotension. In those patients experiencing cough on an ACE inhibitor, the ACE inhibitor may be discontinued and, if necessary, ARB therapy instituted. Because of the potent teratogenic effects of ACE inhibitors, these drugs should be avoided, if possible, when treating women of childbearing potential not on effective birth control measures.

Drug Interactions: Concomitant indomethacin therapy may blunt the reduction in sitting and 24-hour ambulatory diastolic blood pressure. Use of NSAIDs should be avoided or limited, with monitoring of blood pressure control in this setting. In patients with heart failure, NSAID use may be associated with an increased risk for fluid accumulation and edema.

Anesthesia and Critical Care Concerns/Other ConsiderationsSevere hypotension may occur in patients who are sodium and/or volume depleted, initiate lower doses and monitor closely when starting therapy in these patients

ACE inhibitors decrease morbidity and mortality in patients with asymptomatic and symptomatic left ventricular dysfunction. In this situation, they decrease hospitalizations for, and retard progression to, congestive heart failure. ACE inhibitors are also indicated in patients postmyocardial infarction in whom left ventricular ejection fraction is <40%. When used in patients with heart failure, the target dose of 10 mg twice daily should be achieved, if possible. Lower daily doses of ACE inhibitors have not demonstrated the same cardioprotective effects.

ACE inhibitor therapy may elicit rapid increases in potassium and creatinine, especially when used in patients with bilateral renal artery stenosis. When ACE inhibition is introduced in patients with pre-existing diuretic therapy who are hypovolemic, the ACE inhibitor may induce acute hypotension.

Index TermsEnalapril Maleate; Enalaprilat

Enflurane

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Enflurane may be confused with isoflurane

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(EN floo rane)

U.S. Brand NamesCompound 347™; Ethrane®

Pharmacologic CategoryGeneral Anesthetic, Inhalation

Use: Labeled IndicationsMaintenance of general anesthesia

Dosing: AdultsGeneral anesthesia: Inhalation: Minimum alveolar concentration (MAC), the concentration at which 50% of patients do not respond to surgical incision, is 1.6% for enflurane. The concentration at which amnesia and loss of awareness occur (MAC - awake) is 0.4%. Surgical levels of anesthesia are achieved with concentrations between 0.5% to 3%.

Dosing: ElderlyMAC is reduced in the elderly.

Administration: InhalationVia enflurane-specific calibrated vaporizers

ContraindicationsHypersensitivity to enflurane or any component of the formulation; known or suspected history of malignant hyperthermia

Warnings/Precautions

Concerns related to adverse effects:

- Cardiovascular effects: Decrease in blood pressure is dose dependent, primarily due to peripheral vasodilation. Enflurane does not depress cardiac conduction nor does it sensitize the myocardium to catecholamine-induced arrhythmias like halothane.
- Decreased blood flow: May cause decrease in hepatic, renal and splenic blood flow.
- Hyperkalemia: Use of other inhaled anesthetics has been associated with rare cases of perioperative hyperkalemia; concomitant use of succinylcholine was associated with many of the reported cases, but not all. Risk of hyperkalemia is increased in pediatric patients with underlying neuromuscular disease (eg, Duchenne muscular dystrophy). Other abnormalities may include elevation in CPK and myoglobinuria. Monitor closely for arrhythmias. Aggressively identify and treat hyperkalemia.
- Increased intracranial pressure: May dilate the cerebral vasculature and may, in certain conditions, increase intracranial pressure.
- Malignant hyperthermia: May trigger malignant hyperthermia; avoid use in patients susceptible to malignant hyperthermia.
- Respiratory depression: Respiration is depressed with a $PaCO_2$ of 55 mm Hg at 1 MAC. Hypoxic pulmonary vasoconstriction is blunted. Hypoxia induced increase in ventilation is abolished at low concentrations.

Disease-related concerns:

- Seizure disorder: Not recommended in patients with a history of seizure disorders; EEG seizure complexes have been seen with higher doses especially associated with hypocarbia.

Adverse ReactionsFrequency not defined.

Cardiovascular: Hypotension, myocardial depression, tachycardia

Central nervous system: Seizure activity during or after emergence from enflurane anesthesia; motor activity and/or seizure, especially with hypocapnia, malignant hyperthermia

Gastrointestinal: Nausea, vomiting

Hepatic: Hepatic injury, hepatic failure (rare), necrosis

Renal: Renal dysfunction, nephrotoxicity

Respiratory: Respiratory depression/arrest, hypoxemia, breath holding, cough

Miscellaneous: Shivering

Metabolism/Transport Effects**Substrate** of CYP2E1 (major)

Drug Interactions

CYP2E1 Inhibitors (Moderate): May decrease the metabolism of CYP2E1 Substrates. *Risk C: Monitor therapy*

CYP2E1 Inhibitors (Strong): May decrease the metabolism of CYP2E1 Substrates. *Risk D: Consider therapy modification*

EPINEPHrine: Inhalational Anesthetics may enhance the arrhythmogenic effect of EPINEPHrine. *Risk D: Consider therapy modification*

Methylphenidate: May enhance the hypertensive effect of Inhalational Anesthetics. *Risk X: Avoid combination*

Neuromuscular-Blocking Agents (Nondepolarizing): Inhalational Anesthetics may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). *Risk C: Monitor therapy*

Monitoring ParametersBlood pressure, heart rate and rhythm, temperature, oxygen saturation, end-tidal CO_2 and end-tidal enflurane concentrations should be monitored prior to and throughout anesthesia

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Liquid, for inhalation: >99.9% (250 mL)

Generic AvailableNo

Pharmacodynamics/Kinetics

Onset of action: 7-10 minutes

Duration: Emergence time: Depends on blood concentration when enflurane is discontinued

Metabolism: Hepatic (2% to 10%)

Excretion: Exhaled gases

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNot recommended for use in patients with a seizure disorder. Minimum alveolar concentration may be decreased with concomitant use with a benzodiazepine or opioid. Disulfiram may increase the levels of enflurane.

Anesthesia and Critical Care Concerns/Other ConsiderationsUse of enflurane for induction of general anesthesia is not recommended due to its airway irritant properties and unpleasant odor which may cause breath holding and coughing.

Enfuvirtide

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(en FYOO vir tide)
U.S. Brand NamesFuzeon®
Canadian Brand NamesFuzeon®
Pharmacologic CategoryAntiretroviral Agent, Fusion Protein Inhibitor
Use: Labeled IndicationsTreatment of HIV-1 infection in combination with other antiretroviral agents in treatment-experienced patients with evidence of HIV-1 replication despite ongoing antiretroviral therapy
Dosing: Adults**HIV treatment:** SubQ: 90 mg twice daily
Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**HIV treatment:** SubQ:

Children 6-16 years: 2 mg/kg twice daily (maximum dose: 90 mg twice daily)

Adolescents ≥16 years: Refer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} >35 mL/minute: Clearance not affected; no dosage adjustment required.

Cl_{cr} ≤35 mL/minute: Limited data showed decreased clearance; however, no dosage adjustment recommended.

End-stage renal disease (on dialysis): Limited data showed decreased clearance; however, no dosage adjustment recommended.

Dosing: Hepatic ImpairmentNo dosage adjustment required.
Administration: OtherInject subcutaneously into upper arm, abdomen, or anterior thigh. Do not inject into moles, the navel, over a blood vessel or skin abnormalities such as scar tissue, surgical scars, bruises, or tattoos. In addition, do not inject in or near sites where large nerves are close to the skin including the elbow, knee, groin, or buttocks. Rotate injection site, give injections at a site different from the preceding injection site; do not inject into any site where an injection site reaction is evident. Bioequivalence was found to be similar in a study comparing standard administration using a needle versus a needle-free device.
StorageStore powder at 15°C to 30°C (59°F to 86°F). Reconstituted solutions should be refrigerated and must be used within 24 hours.
ReconstitutionReconstitute with 1.1 mL SWFI; tap vial for 10 seconds and roll gently to ensure contact with diluent; then allow to stand until solution is completed; may require up to 45 minutes to form solution.
ContraindicationsHypersensitivity to enfuvirtide or any component of the formulation
Allergy Considerations

- Enfuvirtide Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Hypersensitivity reactions: May cause hypersensitivity reactions (symptoms may include rash, fever, nausea, vomiting, hypotension, and elevated transaminases).
- Immune reconstitution syndrome: Patients may develop immune reconstitution syndrome resulting in the occurrence of an inflammatory response to an indolent or residual opportunistic infection; further evaluation and treatment may be required.
- Injection site reactions: Local injection site reactions are common. Administration using a needle-free device has been associated with nerve pain (including neuralgia and/or paresthesia lasting up to 6 months), bruising, and hematomas when administered at sites where large nerves are close to the skin; only administer medication in recommended sites.
- Pneumonia: Monitor closely for signs/symptoms of pneumonia; associated with an increased incidence during clinical trials, particularly in patients with a low CD4 cell count, high initial viral load, I.V. drug use, smoking, or a history of lung disease.

Disease-related concerns:

- Bleeding disorders: Use with caution in patients with coagulation disorders (eg, hemophilia) or receiving anticoagulants; increased risk of bleeding at injection site.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <6 years of age.

Pregnancy Risk FactorB
Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies, however, there are no adequate and well-controlled studies in pregnant women. An antiretroviral registry has been established to monitor maternal and fetal outcomes in women receiving antiretroviral drugs. Physicians are encouraged to register patients at 1-800-258-4263 or www.APRegistry.com.

LactationExcretion in breast milk unknown/contraindicated
Breast-Feeding ConsiderationsHIV-infected mothers are discouraged from breast-feeding to decrease potential transmission of HIV.
Adverse Reactions

>10%:

Central nervous system: Fatigue (20%), insomnia (11%)

Gastrointestinal: Diarrhea (32%), nausea (23%)

Local: Injection site reactions (98%; may include pain, erythema, induration, pruritus, ecchymosis, nodule or cyst formation)

1% to 10%:

Dermatologic: Folliculitis (2%)

Gastrointestinal: Weight loss (7%), abdominal pain (4%), appetite decreased (3%), pancreatitis (3%), anorexia (2%), xerostomia (2%)

Hematologic: Eosinophilia (2% to 9%)

Hepatic: Transaminases increased (4%, grade 4: 1%)

Local: Injection site infection (2%)

Neuromuscular & skeletal: CPK increased (3% to 7%), limb pain (3%), myalgia (3%)

Ocular: Conjunctivitis (2%)

Respiratory: Sinusitis (6%), cough (4%), pneumonia (3%)

Miscellaneous: Infections (4% to 6%), herpes simplex (4%), flu-like syndrome (2%)

<1%: Abacavir hypersensitivity worsening, amylase increased, angina, anxiety, constipation, depression, GGT increased, glomerulonephritis, Guillain-Barré syndrome, hepatic steatosis, hyperglycemia; hypersensitivity reactions (symptoms may include rash, fever, nausea, vomiting, hypotension, and transaminase increases); insomnia, lipase increased, lymphadenopathy, neutropenia, peripheral neuropathy, pneumopathy, renal failure, renal insufficiency, respiratory distress, sepsis, sixth nerve palsy, suicide attempt, taste disturbances, thrombocytopenia, toxic hepatitis, triglycerides increased, tubular necrosis, weakness

Drug Interactions

Protease Inhibitors: May increase the serum concentration of Enfuvirtide. Enfuvirtide may increase the serum concentration of Protease Inhibitors. *Risk C: Monitor therapy*

Nursing: Physical Assessment/MonitoringUse caution and monitor closely for symptoms of pneumonia with history of I.V. drug use, smoking, or lung disease. Assess therapeutic response (CD4 level and viral load) and adverse reactions (pneumonia, neuropathy, CNS changes) on a regular basis throughout therapy. Teach patient or caregiver proper use (eg, reconstitution, injection procedure, needle/syringe disposal, and proper timing of medications). Teach patient possible side effects/appropriate interventions and adverse symptoms to report (eg, hypersensitivity reactions, injection site infection).
Patient EducationDo not take any new medication during therapy unless approved by prescriber. This drug will not cure HIV, nor has it been found to reduce transmission of HIV; use appropriate precautions to prevent spread to other persons. This drug is prescribed as one part of a multidrug combination; take exactly as directed for full course of therapy. This drug can only be administered by injection, follow exact injection instructions that come with your medication. Do not mix any other medications in the same syringe. Inject into the upper arm, abdomen, or anterior thigh; do not inject in the same area you did the time before and do not inject around the naval, into scar tissues, a bruise, a mole, or where there is an injection site reaction. Make sure you have an adequate supply of medications on hand; do not allow supply to run out. Do not miss or skip a dose; if you miss a dose, take the missed dose as soon as you can and take the next dose as scheduled. If it is close to the time for the next dose, wait and take the next dose as regularly scheduled. Do not take two doses at the same time. Frequent blood tests may be required with prolonged therapy. May cause injection site reactions such as itching, swelling, redness, pain, hardened skin, or bumps (usually last for <7 days). May cause insomnia, anorexia (small, frequent meals may help), or constipation (increased dietary fiber, fruit, fluids, or exercise may help). Notify prescriber immediately if you experience a hypersensitivity reaction (rash, fever, nausea, vomiting, hypotension, blood in urine) or injection site becomes infected (red, painful, swollen, drainage). Report CNS disturbances (depression, anxiety); weakness, loss of feeling, or muscle pain; respiratory infections, difficulty breathing, flu-like symptoms, unusual cough, fever, alteration in urinary pattern; swelling of legs or feet; or any other persistent adverse reactions. **Pregnancy/breast-feeding precautions:** Notify prescriber if you are or intend to become pregnant. Do not breast feed.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution [preservative free]:

Fuzeon®: 108 mg [90 mg/mL following reconstitution; available in convenience kit of 60 vials, SWFI, syringes, alcohol wipes, patient instructions]

Generic AvailableNo
ManufacturerRoche
Mechanism of ActionBinds to the first heptad-repeat (HR1) in the gp41 subunit of the viral envelope glycoprotein. Inhibits the fusion of HIV-1 virus with CD4 cells by blocking the conformational change in gp41 required for membrane fusion and entry into CD4 cells
Pharmacodynamics/Kinetics

Distribution: V_d: 5.5 L

Protein binding: 92%

Metabolism: Proteolytic hydrolysis (CYP isoenzymes do not appear to contribute to metabolism)

Clearance: Adults: 24.8 mL/hour/kg

Bioavailability: 84% ± 16%

Half-life elimination: 3.8 hours

Time to peak: 4-8 hours

Related Information

- Antiretroviral Therapy for HIV Infection: Adults and Adolescents
- Management of Healthcare Worker Exposures to HBV, HCV, and HIV

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation) and taste disturbance

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusInsomnia is common; may cause depression and anxiety. Suicide attempts have been reported.

Mental Health: Effects on Psychiatric TreatmentMay cause an increase in triglycerides; use caution with clozapine, olanzapine, quetiapine, and mirtazapine. Smokers have an increased risk of pneumonia; monitor. May rarely cause neutropenia and thrombocytopenia; use caution with clozapine, carbamazepine, and valproic acid

Index TermsT-20

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Lovenox® may be confused with Levaquin®, Lotronex®, Protonix®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

International issues:

Lovenox® may be confused with Lotanax® which is a brand name for terfenadine in the Czech Republic

2009 National Patient Safety Goals: The Joint Commission on Accreditation of Healthcare Organizations requires healthcare organizations that provide anticoagulant therapy to have a process in place to reduce the risk of anticoagulant-associated patient harm. Patients receiving anticoagulants should receive individualized care through a defined process that includes standardized ordering, dispensing, administration, monitoring and education. This does not apply to routine short-term use of anticoagulants for prevention of venous thromboembolism when the expectation is that the patient’s laboratory values will remain within or close to normal values (NPSG.03.05.01).

Pronunciation(ee noks a PA rin)

U.S. Brand NamesLovenox®

Canadian Brand NamesEnoxaparin Injection; Lovenox®; Lovenox® HP

Pharmacologic CategoryLow Molecular Weight Heparin

Use: Labeled Indications

Acute coronary syndromes: Unstable angina (UA), non-ST-elevation (NSTEMI), and ST-elevation myocardial infarction (STEMI)

DVT prophylaxis: Following hip or knee replacement surgery, abdominal surgery, or in medical patients with severely-restricted mobility during acute illness who are at risk for thromboembolic complications

DVT treatment (acute): Inpatient treatment (patients with and without pulmonary embolism) and outpatient treatment (patients without pulmonary embolism)

Note: High-risk patients include those with one or more of the following risk factors: >40 years of age, obesity, general anesthesia lasting >30 minutes, malignancy, history of deep vein thrombosis or pulmonary embolism

Use: Unlabeled/InvestigationalProphylaxis and treatment of thromboembolism in children; anticoagulant bridge therapy during temporary interruption of vitamin K antagonist therapy in patients at high risk for thromboembolism; DVT prophylaxis following moderate-risk general surgery, major gynecologic surgery and following higher-risk general surgery for cancer; management of venous thromboembolism (VTE) during pregnancy (Hirsh, 2008)

Dosing: Adults

DVT prophylaxis: SubQ:

Hip replacement surgery:

Twice-daily dosing: 30 mg every 12 hours, with initial dose within 12-24 hours after surgery, and every 12 hours for at least 10 days or until risk of DVT has diminished or the patient is adequately anticoagulated on warfarin.

Once-daily dosing: 40 mg once daily, with initial dose within 9-15 hours before surgery, and daily for at least 10 days (or up to 35 days postoperatively) or until risk of DVT has diminished or the patient is adequately anticoagulated on warfarin.

Knee replacement surgery: 30 mg every 12 hours, with initial dose within 12-24 hours after surgery, and every 12 hours for at least 10 days or until risk of DVT has diminished or the patient is adequately anticoagulated on warfarin.

Abdominal surgery: 40 mg once daily, with initial dose given 2 hours prior to surgery; continue until risk of DVT has diminished (usually 7-10 days).

Medical patients with severely-restricted mobility during acute illness: 40 mg once daily; continue until risk of DVT has diminished (usually 6-11 days).

DVT treatment (acute): SubQ: **Note:** Start warfarin on the first treatment day and continue enoxaparin until INR is between 2 and 3 (usually 5-7 days).

Inpatient treatment (with or without pulmonary embolism): 1 mg/kg/dose every 12 hours or 1.5 mg/kg once daily.

Outpatient treatment (without pulmonary embolism): 1 mg/kg/dose every 12 hours.

ST-elevation MI (STEMI):

Patients <75 years of age: Initial: 30 mg I.V. single bolus plus 1 mg/kg (maximum 100 mg for the first 2 doses only) SubQ every 12 hours. The first SubQ dose should be administered with the I.V. bolus. Maintenance: After first 2 doses, administer 1 mg/kg SubQ every 12 hours.

Patients ≥75 years of age: Initial: SubQ: 0.75 mg/kg every 12 hours (**Note:** No I.V. bolus is administered in this population); a maximum dose of 75 mg is recommended for the first 2 doses. Maintenance: After first 2 doses, administer 0.75 mg/kg SubQ every 12 hours

Additional notes on STEMI treatment: Therapy was continued for 8 days or until hospital discharge; optimal duration not defined. Unless contraindicated, all patients received aspirin (75-325 mg daily) in clinical trials. In patients with STEMI receiving thrombolytics, initiate enoxaparin dosing between 15 minutes before and 30 minutes after fibrinolytic therapy. In patients undergoing PCI, if balloon inflation occurs ≤8 hours after the last SubQ enoxaparin dose, no additional dosing is needed. If balloon inflation occurs 8-12 hours after last SubQ enoxaparin dose, a single I.V. dose of 0.3 mg/kg should be administered.

Unstable angina or non-ST-elevation MI (NSTEMI): 1 mg/kg every 12 hours in conjunction with oral aspirin therapy (100-325 mg once daily); continue until clinical stabilization (a minimum of at least 2 days)

Dosing: ElderlySubQ: Refer to adult dosing. Increased incidence of bleeding with doses of 1.5 mg/kg/day or 1 mg/kg every 12 hours; injection-associated bleeding and serious adverse reactions are also increased in the elderly. Careful attention should be paid to elderly patients, particularly those <45 kg. **Note:** Dosage alteration/adjustment may be required.

Dosing: PediatricThromboembolism (unlabeled use; Monagle, 2008): SubQ:

Infants <2 months: Initial:

Prophylaxis: 0.75 mg/kg every 12 hours

Treatment: 1.5 mg/kg every 12 hours

Infants >2 months and Children ≤18 years: Initial:

Prophylaxis: 0.5 mg/kg every 12 hours

Treatment: 1 mg/kg every 12 hours

Maintenance: See **Dosage Titration** table:

Enoxaparin Pediatric Dosage Titration

Antifactor Xa	**Dose Titration**	**Time to Repeat Antifactor Xa Level**
<0.35 units/mL	Increase dose by 25%	4 h after next dose
0.35-0.49 units/mL	Increase dose by 10%	4 h after next dose
0.5-1 unit/mL	Keep same dosage	Next day, then 1 wk later, then monthly (4 h after dose)
1.1-1.5 units/mL	Decrease dose by 20%	Before next dose
1.6-2 units/mL	Hold dose for 3 h and decrease dose by 30%	Before next dose, then 4 h after next dose
>2 units/mL	Hold all doses until antifactor Xa is 0.5 units/mL, then decrease dose by 40%	Before next dose and every 12 h until antifactor Xa <0.5 units/mL

Modified from Monagle P, Michelson AD, Bovill E, et al, “Antithrombotic Therapy in Children,” *Chest*, 2001, 119:344S-70S.

Dosing: Renal Impairment

Cl$_{cr}$ ≥30 mL/minute: No specific adjustment recommended (per manufacturer); monitor closely for bleeding.

Cl$_{cr}$ <30 mL/minute:

DVT prophylaxis in abdominal surgery, hip replacement, knee replacement, or in medical patients during acute illness: SubQ: 30 mg once daily

DVT treatment (inpatient or outpatient treatment in conjunction with warfarin): SubQ: 1 mg/kg once daily

STEMI:

<75 years: Initial: I.V.: 30 mg as a single dose with the first dose of the SubQ maintenance regimen administered at the same time as the I.V. bolus

≥75 years of age: Omit I.V. bolus; Maintenance: SubQ: 1 mg/kg every 24 hours in all patients

Unstable angina, NSTEMI: SubQ: 1 mg/kg once daily

Dialysis: Enoxaparin has not been FDA approved for use in dialysis patients. It's elimination is primarily via the renal route. Serious bleeding complications have been reported with use in patients who are dialysis dependent or have severe renal failure. LMWH administration at fixed doses without monitoring has greater unpredictable anticoagulant effects in patients with chronic kidney disease. If used, dosages should be reduced and anti-Xa levels frequently monitored, as accumulation may occur with repeated doses. Many clinicians would not use enoxaparin in this population especially without timely anti-Xa levels.

Hemodialysis: Supplemental dose is not necessary.

Peritoneal dialysis: Significant drug removal is unlikely based on physiochemical characteristics.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.M.Do **not** administer I.M.

Administration: I.V.May be administered I.V. as part of treatment for ST-elevation myocardial infarction (STEMI) only in patients <75 years of age or during PCI. The manufacturer recommends using the multiple-dose vial to prepare I.V. doses. Do not mix or coadminister with other medications.

Administration: I.V. DetailpH: 5.5-7.5

Administration: OtherShould be administered by deep SubQ injection to the left or right anterolateral and left or right posterolateral abdominal wall. To avoid loss of drug from the 30 mg and 40 mg syringes, do not expel the air bubble from the syringe prior to injection. In order to minimize bruising, do not rub injection site. An automatic injector (Lovenox EasyInjector™) is available with the 30 mg and 40 mg syringes to aid the patient with self-injections. **Note:** Enoxaparin is available in 100 mg/mL and 150 mg/mL concentrations.

StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F); do not freeze.

CompatibilityStable in D_5W, NS; do not mix with other injections or infusions.

ContraindicationsHypersensitivity to enoxaparin, heparin, or any component of the formulation; thrombocytopenia associated with a positive *in vitro* test for antiplatelet antibodies in the presence of enoxaparin; hypersensitivity to pork products; active major bleeding; not for I.M. use

Allergy Considerations

- Low Molecular Weight Heparin Allergy

Warnings/Precautions

Boxed warnings:

- Neuraxial anesthesia: See “Other warnings/precautions” below.

Concerns related to adverse effects:

- Bleeding: Monitor patient closely for signs or symptoms of bleeding. Certain patients are at increased risk of bleeding. Risk factors include bacterial endocarditis; congenital or acquired bleeding disorders; active ulcerative or angiodysplastic GI diseases; severe uncontrolled hypertension; history of hemorrhagic stroke; or use shortly after brain, spinal, or ophthalmic surgery; in patients treated concomitantly with platelet inhibitors; recent GI bleeding; thrombocytopenia or platelet defects; severe liver disease; hypertensive or diabetic retinopathy; or in patients undergoing invasive procedures. Discontinue if bleeding occurs.

- Hyperkalemia: Monitor for hyperkalemia; can cause hyperkalemia by suppressing aldosterone production. Most commonly occurs in patients with risk factors for the development of hyperkalemia (eg, renal dysfunction, concomitant use of potassium-sparing diuretics or potassium supplements, hematoma in body tissues).

- Thrombocytopenia: Rare cases of thrombocytopenia have occurred. Use with caution in patients with history of heparin-induced thrombocytopenia; monitor platelet count closely. Discontinue therapy and consider alternative treatment if platelets are <100,000/mm^3 and/or thrombosis develops. Rare cases of thrombocytopenia with thrombosis have occurred. Use caution in patients with congenital or drug-induced thrombocytopenia or platelet defects.

Disease-related concerns:

- Prosthetic heart valves: Cannot be recommended for long-term thromboprophylaxis in patients with prosthetic heart valves (especially pregnant women) due to insufficient evidence.

- Renal impairment: Use with caution in patients with renal failure; dosage adjustment needed if Cl_{cr} <30 mL/minute.

Special populations:

- Elderly: Use with caution in the elderly; delayed elimination may occur. Dosage alteration/adjustment may be required (eg, omission of I.V. bolus in acute STEMI in patients ≥75 years of age).

- Low weight patients: Risk of bleeding may be increased in women <45 kg and in men <57 kg.

Dosage form specific issues:

- Multidose vials: Contain benzyl alcohol and should not be used in pregnant women. In neonates, large amounts of benzyl alcohol (>100 mg/kg/day) have been associated with fatal toxicity (gasping syndrome).

Other warnings/precautions:

- Administration: Do **not** administer intramuscularly.

- Conversion to other products: Not to be used interchangeably (unit for unit) with heparin or any other low molecular weight heparins.

- Neuraxial anesthesia: **[U.S. Boxed Warning]: Patients with recent or anticipated neuraxial anesthesia (epidural or spinal anesthesia) are at risk of spinal or epidural hematoma and subsequent paralysis.** Consider risk versus benefit prior to neuraxial anesthesia; risk is increased by concomitant agents which may alter hemostasis or by the use of indwelling epidural catheters for analgesia, as well as traumatic or repeated epidural or spinal puncture. Patient should be observed closely for bleeding and signs and symptoms of neurological impairment if therapy is administered during or immediately following diagnostic lumbar puncture, epidural anesthesia, or spinal anesthesia.

Geriatric ConsiderationsNo specific dosage adjustment recommendations for most indications, however, total clearance is lower and elimination is delayed in patients with renal failure. Adjustment may be necessary if renal impairment is present. In the treatment of STEMI, a lower dosage (0.75 mg/kg every 12 hours) and omission of the I.V. bolus, are recommended in patients ≥75 years of age.

Over 2800 patients, ≥65 years of age, have received enoxaparin sodium in pivotal clinical trials. The efficacy of enoxaparin injection in elderly (≥65 years) was similar to that seen in younger patients (<65 years). The incidence of bleeding complications was similar between elderly and younger patients when 30 mg every 12 hours or 40 mg once daily doses of enoxaparin injection was administered at doses of 1.5 mg/kg/day or 1 mg/kg every 12 hours. The risk of enoxaparin injection associated bleeding increased with age. Serious adverse events increased with age for patients receiving enoxaparin injections. Other clinical experience (including postmarketing surveillance and literature reports) has not revealed additional differences in the safety of enoxaparin injection between elderly and younger patients. Careful attention to dosing intervals and concomitant medications (especially antiplatelet medications) is advised. Monitoring of elderly patients with low body weight (<45 kg) and those predisposed to decreased renal function should be considered.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAnimal studies have not shown teratogenic or fetotoxic effects. Pregnancy itself increases the risk of thromboembolism. Pregnant women with a history of thromboembolic disease are at increased risk of maternal and fetal complications. Enoxaparin does not cross the placenta. Use may be recommended in pregnant women for the management of VTE. Monitoring antifactor Xa levels is recommended. Risk of adverse events may be increased in pregnant women with mechanical heart valves; use is controversial and has not been adequately studied. Postmarketing reports include congenital abnormalities (cause and effect not established) and also fetal death when used in pregnant women. Multiple-dose vials contain benzyl alcohol; use caution in pregnant women.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsThis drug has a high molecular weight that would minimize excretion in breast milk and is inactivated by the GI tract which further reduces the risk to the infant.

Adverse ReactionsAs with all anticoagulants, bleeding is the major adverse effect of enoxaparin. Hemorrhage may occur at virtually any site. Risk is dependent on multiple variables. At the recommended doses, single injections of enoxaparin do not significantly influence platelet aggregation or affect global clotting time (ie, PT or aPTT).

1% to 10%:

Central nervous system: Fever (5% to 8%), confusion, pain

Dermatologic: Erythema, bruising

Gastrointestinal: Nausea (3%), diarrhea

Hematologic: Hemorrhage (major, <1% to 4%; includes cases of intracranial, retroperitoneal, or intraocular hemorrhage; incidence varies with indication/population), thrombocytopenia (moderate 1%; severe 0.1% - see note below), anemia (<2%)

Hepatic: ALT, increased, AST increased

Local: Injection site hematoma (9%), local reactions (irritation, pain, ecchymosis, erythema)

Renal: Hematuria (<2%)

<1% and/or postmarketing case reports (limited to important or life-threatening): Allergic reaction, anaphylactoid reaction, cutaneous vasculitis (hypersensitive), eczematous plaques, hematoma (see note on "Spinal or epidural hematomas" below), hyperkalemia, hyperlipidemia, hypertriglyceridemia, intracranial hemorrhage (up to 0.8%), erythematous pruritic patches, pruritus, purpura, retroperitoneal bleeding, skin necrosis, thrombocytopenia with thrombosis, thrombocytosis, urticaria, vesicobullous rash

Notes:

Spinal or epidural hematomas: Can occur following neuraxial anesthesia or spinal puncture, resulting in paralysis. Risk is increased in patients with indwelling epidural catheters or concomitant use of other drugs affecting hemostasis. Prosthetic valve thrombosis, including fatal cases, has been reported in pregnant women receiving enoxaparin as thromboprophylaxis.

Thrombocytopenia with thrombosis: Cases of heparin-induced thrombocytopenia (some complicated by organ infarction, limb ischemia, or death) have been reported.

Drug Interactions

Anticoagulants: May enhance the anticoagulant effect of other Anticoagulants. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Dasatinib: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Drotrecogin Alfa: Heparin (Low Molecular Weight) may enhance the adverse/toxic effect of Drotrecogin Alfa. This is of most concern with therapeutic doses of LMW heparin. Bleeding may occur. *Risk D: Consider therapy modification*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Anticoagulants. Bleeding may occur. *Risk D: Consider therapy modification*

Ibritumomab: Anticoagulants may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to an increased risk of bleeding. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the adverse/toxic effect of Anticoagulants. Specifically, the antiplatelet effects of these agents may lead to an increased risk of bleeding with the combination. *Risk C: Monitor therapy*

Salicylates: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Thrombolytic Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Tositumomab and Iodine I 131 Tositumomab: Anticoagulants may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse effects may be increased. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid cat's claw, dong quai, evening primrose, feverfew, garlic, ginger, ginkgo, red clover, horse chestnut, green tea, ginseng (all have additional antiplatelet activity).

Monitoring ParametersPlatelets, occult blood, anti-Xa levels, serum creatinine; monitoring of PT and/or aPTT is not necessary. Routine monitoring of anti-Xa levels is not required, but has been utilized in patients with obesity and/or renal insufficiency. Monitoring anti-Xa levels is recommended in pregnant women receiving therapeutic doses of enoxaparin (Hirsh, 2008).

Reference RangeThe following therapeutic ranges for anti-Xa levels have been suggested, but have not been validated in a controlled trial. Anti-Xa level measured 4 hours post dose.

DVT treatment (every-12-hour dosing): 0.6-1 units/mL

DVT treatment (once-daily dosing): 1-2 units/mL

Nursing: Physical Assessment/MonitoringUse caution in presence or history of conditions that increase risk of bleeding. Assess potential for interactions with other pharmacological agents or herbal products patient may be taking (especially anything that will impact coagulation or platelet aggregation). Note specific injection directions. Monitor results of laboratory tests, therapeutic effectiveness according to purpose for use, and adverse response (eg, bleeding, thrombosis). Teach patient possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsPlatelets, occult blood, anti-Xa levels, serum creatinine; monitoring of PT and/or aPTT is not necessary. Routine monitoring of anti-Xa levels is not required, but has been utilized in patients with obesity and/or renal insufficiency. Monitoring anti-Xa levels is recommended in pregnant women receiving therapeutic doses of enoxaparin (Hirsh, 2008).

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy without consulting prescriber. This drug can only be administered by injection. If self-administered, follow exact directions for injection and needle disposal. Do not make major changes to your diet unless recommended by prescriber. You may have a tendency to bleed easily while taking this drug (brush teeth with soft brush, use waxed dental floss, use electric razor, avoid scissors or sharp knives, and potentially harmful activities). Report chest pain; persistent constipation; persistent erection; unusual bleeding or bruising (bleeding gums, nosebleed, blood in urine, dark stool); pain in joints or back; or redness, swelling, burning, or pain at injection site. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as sodium [graduated prefilled syringe; preservative free]:

Lovenox®: 60 mg/0.6 mL (0.6 mL); 80 mg/0.8 mL (0.8 mL); 100 mg/mL (1 mL); 120 mg/0.8 mL (0.8 mL); 150 mg/mL (1 mL)

Injection, solution, as sodium [multidose vial]:

Lovenox®: 100 mg/mL (3 mL) [contains benzyl alcohol]

Injection, solution, as sodium [prefilled syringe; preservative free]:

Lovenox®: 30 mg/0.3 mL (0.3 mL); 40 mg/0.4 mL (0.4 mL)

Mechanism of ActionStandard heparin consists of components with molecular weights ranging from 4000-30,000 daltons with a mean of 16,000 daltons. Heparin acts as an anticoagulant by enhancing the inhibition rate of clotting proteases by antithrombin III impairing normal hemostasis and inhibition of factor Xa. Low molecular weight heparins have a small effect on the activated partial thromboplastin time and strongly inhibit factor Xa. Enoxaparin is derived from porcine heparin that undergoes benzylation followed by alkaline depolymerization. The average molecular weight of enoxaparin is 4500 daltons which is distributed as (≤20%) 2000 daltons (≥68%) 2000-8000 daltons, and (≤15%) >8000 daltons. Enoxaparin has a higher ratio of antifactor Xa to antifactor IIa activity than unfractionated heparin.

Pharmacodynamics/Kinetics

Onset of action: Peak effect: SubQ: Antifactor Xa and antithrombin (antifactor IIa): 3-5 hours

Duration: 40 mg dose: Antifactor Xa activity: ~12 hours

Distribution: 4.3 L (based on antifactor Xa activity)

Metabolism: Hepatic, to lower molecular weight fragments (little activity)

Protein binding: Does not bind to heparin binding proteins

Half-life elimination, plasma: 2-4 times longer than standard heparin, independent of dose; based on anti-Xa activity: 4.5-7 hours

Excretion: Urine (40% of dose; 10% as active fragments)

Related Information

- Anticoagulants, Injectable

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: As with all anticoagulants, bleeding is the major adverse effect of enoxaparin. Hemorrhage may occur at virtually any site; risk is dependent on multiple variables. At the recommended doses, single injections of enoxaparin do not significantly influence platelet aggregation or affect global clotting time (ie, PT or aPTT).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause confusion

Mental Health: Effects on Psychiatric TreatmentNone reported

Cardiovascular ConsiderationsLow molecular weight heparins (LMWHs) compare favorably to unfractionated heparin (UFH) in the prevention and treatment of venous thromboembolism. LMWHs are associated with less thrombocytopenia, compared to heparin, and do not require routine therapeutic monitoring. In patients with unstable angina and non-ST-elevation myocardial infarction (UA/NSTEMI), the 2002 ACC/AHA guidelines recommend anticoagulation with subcutaneous LMWH or intravenous UFH be added to antiplatelet therapy with aspirin and/or clopidogrel. Enoxaparin is preferable to UFH as an anticoagulant unless CABG is planned within 24 hours (Class IIa recommendation; level of evidence: A). In patients with ST-elevation myocardial infarction, most studies are limited to small numbers of patients treated with dalteparin or enoxaparin. Control groups (placebo, UFH), dosing, primary endpoints (composite ones), and bleeding definitions vary. In general, the studies suggest equivalent or superior outcomes with these LMWHs and less major bleeding. Preliminary results of a larger trial comparing prehospital dosing of enoxaparin (30 mg I.V. bolus; 1 mg/kg SubQ twice daily for a maximum of 7 days) versus UFH in patients receiving tenecteplase suggests a higher incidence of major bleeding and intracranial hemorrhage in the enoxaparin group (Wallentin L, 2003). Almost all cases of intracranial hemorrhage were confined to patients >75 years of age. Another ongoing trial will address this safety issue. In the 2004 ACC/AHA guideline for patients with ST-elevation MI (STEMI), a low molecular weight heparin might be considered an acceptable alternative to unfractionated heparin for patients <75 years of age who are receiving fibrinolytic therapy. The patient must have reasonable renal function (serum creatinine <2.5 mg/dL in men and <2 mg/dL in women). Enoxaparin in combination with full-dose tenecteplase is the best studied regimen (Wallentin L, 2003).

Obesity/Renal Dysfunction: There is no consensus for adjusting/correcting the weight-based dosage of LMWH for patients who are morbidly obese. Anti-Xa levels are increased to appropriate levels when enoxaparin is dosed on actual body weight in obese patients weighing up to 144 kg (Sanderink, 2002). Monitoring of anti-Xa levels 4 hours after injection may be warranted. Patients who have a reduction in calculated creatinine clearance are at risk of accumulated anticoagulant effect when they are treated with certain LMWHs. All LMWHs may not behave the same in patients with renal dysfunction. Some clinicians monitor anti-Xa levels in patients with Cl_{cr} <30 mL/minute if assay results are readily available. Patients requiring dialysis should not receive enoxaparin due to an increased risk of bleeding resulting from drug accumulation.

Anesthesia and Critical Care Concerns/Other ConsiderationsMany critically-ill and surgical patients require preventative measures for venous thromboembolism. Low molecular weight heparins (LMWHs) compare favorably to unfractionated heparin in the prevention and treatment of venous thromboembolism. LMWHs are associated with less thrombocytopenia, compared to heparin, and do not require routine therapeutic monitoring. The anticoagulant effect of LMWHs is not reliably reversed with protamine. Therefore, consideration should be given to enoxaparin’s duration of action when invasive procedures (eg, surgery, line placement) are required.

Obesity/Renal Dysfunction: There is no consensus for adjusting/correcting the weight-based dosage of LMWH for patients who are morbidly obese. Anti-Xa levels are increased to appropriate levels when enoxaparin is dosed on actual body weight in obese patients weighing up to 144 kg (Sanderink, 2002). Monitoring of anti-Xa levels 4 hours after injection may be warranted. Patients who have a reduction in calculated creatinine clearance are at risk of accumulated anticoagulant effect when they are treated with certain LMWHs. All LMWHs may not behave the same in patients with renal dysfunction. Some clinicians monitor anti-Xa levels in patients with Cl_{cr} <30 mL/minute if assay results are readily available. Patients requiring dialysis should not receive enoxaparin due to an increased risk of bleeding resulting from drug accumulation.

Index TermsEnoxaparin Sodium

Entacapone

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(en TA ka pone)

U.S. Brand NamesComtan®

Canadian Brand NamesComtan®

Pharmacologic CategoryAnti-Parkinson's Agent, COMT Inhibitor

Use: Labeled IndicationsAdjunct to levodopa/carbidopa therapy in patients with idiopathic Parkinson's disease who experience “wearing-off” symptoms at the end of a dosing interval

Dosing: AdultsParkinson's disease: Oral: 200 mg with each dose of levodopa/carbidopa, up to a maximum of 8 times/day (maximum daily dose: 1600 mg/day). To optimize therapy, the dosage of levodopa may need reduced or the dosing interval may need extended. Patients taking levodopa ≥800 mg/day or who had moderate-to-severe dyskinesias prior to therapy required an average decrease of 25% in the daily levodopa dose.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNo adjustment is required; dialysis patients were not studied.

Dosing: Hepatic ImpairmentDosage adjustment in chronic therapy with standard treatment has not been studied.

Dietary ConsiderationsMay be taken with or without food.

ContraindicationsHypersensitivity to entacapone or any of component of the formulation

Allergy Considerations

- COMT Inhibitor Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Diarrhea: Has been associated with delayed development of diarrhea (onset after 2-12 weeks); use with caution in patients with lower gastrointestinal disease or an increased risk of dehydration.
- Hallucinations: May cause hallucinations, which may improve with reduction in levodopa therapy.
- Neuroleptic malignant syndrome: Entacapone, in conjunction with other drug therapy that alters brain biogenic amine concentrations (eg, MAO inhibitors, SSRIs), has been associated with a syndrome resembling neuroleptic malignant syndrome (hyperpyrexia and confusion - some fatal) on abrupt withdrawal or dosage reduction. Concomitant use of tolcapone and nonselective MAO inhibitors should be avoided.
- Orthostatic hypotension: May cause orthostatic hypotension and syncope; Parkinson's disease patients appear to have an impaired capacity to respond to a postural challenge; use with caution in patients at risk of hypotension (such as those receiving antihypertensive drugs) or where transient hypotensive episodes would be poorly tolerated (cardiovascular disease or cerebrovascular disease). Parkinson's patients being treated with dopaminergic agonists ordinarily require careful monitoring for signs and symptoms of postural hypotension, especially during dose escalation, and should be informed of this risk.
- Pleural/retroperitoneal fibrosis: Dopaminergic agents from the ergot class have been associated with fibrotic complications, such as retroperitoneal fibrosis, pulmonary infiltrates or effusion and pleural thickening. It is unknown whether non-ergot, pro-dopaminergic agents like tolcapone confer this risk.
- Rhabdomyolysis: Severe rhabdomyolysis has been reported with use.

Disease-related concerns:

- Dyskinesia: Use with caution in patients with pre-existing dyskinesias; exacerbation of pre-existing dyskinesia has been reported. Levodopa dosage reduction may be required, particularly in patients with levodopa dosages >600 mg daily or with moderate-to-severe dyskinesia prior to initiation.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Renal impairment: Use with caution in patients with severe renal impairment.

Concurrent drug therapy issues:

- MAO inhibitors: Concomitant use of tolcapone and nonselective MAO inhibitors should be avoided. Selegiline is a selective MAO type B inhibitor (when given orally at ≤10 mg/day) and can be taken with entacapone.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Discontinuation of therapy: Do not withdraw therapy abruptly.

Geriatric ConsiderationsNo difference in adverse effects was noted in the elderly. Monitor levodopa dose.
Pregnancy Risk FactorC
Pregnancy ConsiderationsNot recommended
LactationExcretion in breast milk unknown/use caution
Adverse Reactions

>10%:

Gastrointestinal: Nausea (14%)

Neuromuscular & skeletal: Dyskinesia (25%), placebo (15%)

1% to 10%:

Cardiovascular: Orthostatic hypotension (4%), syncope (1%)

Central nervous system: Dizziness (8%), fatigue (6%), hallucinations (4%), anxiety (2%), somnolence (2%), agitation (1%)

Dermatologic: Purpura (2%)

Gastrointestinal: Diarrhea (10%), abdominal pain (8%), constipation (6%), vomiting (4%), dry mouth (3%), dyspepsia (2%), flatulence (2%), gastritis (1%), taste perversion (1%)

Genitourinary: Brown-orange urine discoloration (10%)

Neuromuscular & skeletal: Hyperkinesia (10%), hypokinesia (9%), back pain (4%), weakness (2%)

Respiratory: Dyspnea (3%)

Miscellaneous: Bacterial infection (1%), diaphoresis increased (2%)

<1%: Hyperpyrexia and confusion (resembling neuroleptic malignant syndrome), pulmonary fibrosis, rhabdomyolysis, retroperitoneal fibrosis

Metabolism/Transport Effects**Inhibits** CYP1A2 (weak), 2A6 (weak), 2C9 (weak), 2C19 (weak), 2D6 (weak), 2E1 (weak), 3A4 (weak)
Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

COMT Substrates: COMT Inhibitors may decrease the metabolism of COMT Substrates. *Risk C: Monitor therapy*

MAO Inhibitors: COMT Inhibitors may enhance the adverse/toxic effect of MAO Inhibitors. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS adverse effects).

Food: Entacapone has been reported to chelate iron and decreasing serum iron levels were noted in clinical trials; however, clinically significant anemia has not been observed.

Monitoring ParametersSigns and symptoms of Parkinson's disease; liver function tests, blood pressure, patient's mental status; serum iron (if signs of anemia)
Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Monitor therapeutic effectiveness and adverse reactions. Monitor blood pressure. Taper dosage when discontinuing. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse reactions to report.
Monitoring: Lab TestsLiver function tests, serum iron (if signs of anemia)
Patient EducationTake exactly as directed; do not alter dosage or discontinue without consulting prescriber. May be taken with food. Notify prescriber if any other prescription medications you are taking. Avoid all alcohol or OTC medications unless approved by your prescriber. Orange-brown urine is normal with this medication. You may experience dizziness, fatigue, or sleepiness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); postural hypotension (rise slowly when getting up from chair or bed, when climbing stairs); or unusual taste, nausea, vomiting, flatulence, or upset stomach (small frequent meals, good mouth care, chewing gum, or sucking hard candy may help). Report any increased or abnormal skeletal movements or pain; unresolved sedation, nausea, diarrhea, constipation, or GI distress; signs of infection; persistent dizziness or sleepiness; or other unusual responses. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 200 mg

Generic AvailableNo
ManufacturerNovartis Pharmaceuticals Corp
Pricing: U.S. (www.drugstore.com)

Tablets (Comtan)

200 mg (30): $87.19

Mechanism of ActionEntacapone is a reversible and selective inhibitor of catechol-O-methyltransferase (COMT). When entacapone is taken with levodopa, the pharmacokinetics are altered, resulting in more sustained levodopa serum levels compared to levodopa taken alone. The resulting levels of levodopa provide for increased concentrations available for absorption across the blood-brain barrier, thereby providing for increased CNS levels of dopamine, the active metabolite of levodopa.

Pharmacodynamics/Kinetics

Onset of action: Rapid

Peak effect: 1 hour

Absorption: Rapid

Distribution: I.V.: V_{dss}: 20 L

Protein binding: 98%, primarily to albumin

Metabolism: Isomerization to the *cis*-isomer, followed by direct glucuronidation of the parent and *cis*-isomer

Bioavailability: 35%

Half-life elimination: B phase: 0.4-0.7 hours; Y phase: 2.4 hours

Time to peak, serum: 1 hour

Excretion: Feces (90%); urine (10%)

Related Information

- Antiparkinsonian Agents

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Orthostatic hypotension and abnormal taste. Dopaminergic therapy in Parkinson's disease (ie, treatment with levodopa) is associated with orthostatic hypotension. Entacapone enhances levodopa bioavailability and may increase the occurrence of hypotension/syncope in the dental patient. The patient should be carefully assisted from the chair and observed for signs of orthostatic hypotension.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Pronunciation(en TE ka veer)

U.S. Brand NamesBaraclude®

Canadian Brand NamesBaraclude®

Pharmacologic CategoryAntiretroviral Agent, Reverse Transcriptase Inhibitor (Nucleoside)

Use: Labeled IndicationsTreatment of chronic hepatitis B infection in adults with evidence of active viral replication and either evidence of persistent transaminase elevations or histologically-active disease

Dosing: AdultsTreatment of chronic hepatitis B infection: Oral:

Nucleoside treatment naive: 0.5 mg daily

Lamivudine-resistant viremia (or known lamivudine- or telbivudine-resistant mutations): 1 mg daily

Note: Usual treatment duration is at least 1 year and varies with HBeAg status; consult current guidelines and literature.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricAdolescents ≥16 years: Refer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} 30-49 mL/minute: Administer 50% of usual dose daily or administer the normal dose every 48 hours

Cl_{cr} 10-29 mL/minute: Administer 30% of usual dose daily or administer the normal dose every 72 hours

Cl_{cr} <10 mL/minute (including hemodialysis and CAPD): Administer 10% of usual dose daily or administer the normal dose every 7 days; administer after hemodialysis

Dosing: Hepatic ImpairmentNo adjustment necessary.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralAdminister on an empty stomach. Do not dilute or mix oral solution with water or other beverages; use calibrated oral dosing syringe. Oral solution and tablet are bioequivalent on a mg-to-mg basis.

Dietary ConsiderationsTake on an empty stomach (2 hours before or after a meal).

StorageStore at controlled room temperature of 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Protect oral solution from light.

ContraindicationsHypersensitivity to entecavir or any component of the formulation

Warnings/Precautions

Boxed warnings:

- Chronic hepatitis B: See “Disease-related concerns” below.
- Human immunodeficiency virus (HIV): See “Disease-related concerns” below.
- Lactic acidosis/hepatomegaly: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Lactic acidosis/hepatomegaly: **[U.S Boxed Warning]: Lactic acidosis and severe hepatomegaly with steatosis have been reported with nucleoside analogues, including fatal cases;** use with caution in patients with risk factors for liver disease (risk may be increased with female gender, obesity, pregnancy or prolonged exposure) and suspend treatment in any patient who develops clinical or laboratory findings suggestive of lactic acidosis or hepatotoxicity (transaminase elevation may/may not accompany hepatomegaly and steatosis).

Disease-related concerns:

- Chronic hepatitis B: **[U.S. Boxed Warning]: Severe, acute exacerbation of hepatitis B may occur upon discontinuation.** Monitor liver function several months after stopping treatment; reinitiation of antihepatitis B therapy may be required.
- HIV: **[U.S. Boxed Warning]: May cause the development of HIV resistance in chronic hepatitis B patients with unrecognized or untreated HIV infection.** Determine HIV status prior to initiating treatment with entecavir. Not recommended for HIV/HBV coinfected patients unless also receiving highly active antiretroviral therapy (HAART). The manufacturer's labeling states that entecavir does not exhibit any clinically-relevant activity against human immunodeficiency virus (HIV type 1). However, a small number of case reports have indicated declines in virus levels during entecavir therapy. Reports of HIV resistance to a common HIV drug has been reported in an HIV/HBV-infected patient receiving entecavir as monotherapy for HBV.

- Renal impairment: Use with caution in patients with renal impairment or patients receiving concomitant therapy which may reduce renal function; dose adjustment recommended for Cl_{cr} <50 mL/minute.

Special populations:

- Liver transplant recipients: Safety and efficacy have not been established in liver transplant patients; monitor renal function before and during treatment in liver transplant patients receiving concurrent therapy of cyclosporine or tacrolimus; entecavir dosage may need to be adjusted.

- Pediatrics: Safety and efficacy have not been established in patients <16 years of age.

Other warnings/precautions:

- Resistance: Cross-resistance may develop in patients failing previous therapy with lamivudine.

Geriatric ConsiderationsSee dosing for renal impairment.
Pregnancy Risk FactorC
Pregnancy ConsiderationsTeratogenic effects have been observed in animal studies. There are no adequate and well-controlled studies in pregnant women. Use only if benefit outweighs risk. Pregnant women taking entecavir should enroll in the pregnancy registry by calling 1-800-258-4263.
LactationExcretion in breast milk unknown/not recommended
Adverse Reactions

>10%: Hepatic: ALT increased (>5 x ULN: 11% to 12%; post-treatment flare [lamivudine refractory]: >10 x ULN and >2 x baseline: 12%)

1% to 10%:

Central nervous system: Headache (2% to 4%), fatigue (1% to 3%), dizziness

Endocrine & metabolic: Hyperglycemia (2% to 3%)

Gastrointestinal: Lipase increased (7%), amylase increased (2% to 3%), diarrhea (≤1%), dyspepsia (≤1%), nausea

Hepatic: Bilirubin increased (2% to 3%), ALT increased (>10 x ULN and >2 x baseline: 2%; post-treatment flare [nucleoside-naive]: >10 x ULN and >2 x baseline: 2% to 8%)

Renal: Hematuria (9%), glycosuria (4%), creatinine increased (1% to 2%)

<1% (Limited to important or life-threatening): Anaphylactoid reaction, hypoalbuminemia, insomnia, rash, somnolence, thrombocytopenia, vomiting

Drug Interactions

Ganciclovir-Valganciclovir: May enhance the adverse/toxic effect of Reverse Transcriptase Inhibitors (Nucleoside). Hematologic toxicity is of specific concern. *Risk D: Consider therapy modification*

Ribavirin: May enhance the hepatotoxic effect of Reverse Transcriptase Inhibitors (Nucleoside). Lactic acidosis may occur. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Food: Food delays absorption and reduces AUC by 18% to 20%.

Monitoring ParametersHIV status (prior to initiation of therapy); liver function tests, renal function; in HBV/HIV-coinfected patients, monitor HIV viral load and CD4 count
Monitoring: Lab TestsHIV status (prior to initiation of therapy); liver function tests, renal function; in HBV/HIV-coinfected patients, monitor HIV viral load and CD4 count
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Oral solution:

Baraclude®: 0.05 mg/mL (210 mL) [orange flavor]

Tablet:

Baraclude®: 0.5 mg, 1 mg

Generic AvailableNo
ManufacturerBristol-Myers Squibb
Pricing: U.S. (www.drugstore.com)

Tablets (Baraclude)

0.5 mg (30): $779.98

Mechanism of ActionEntecavir is intracellularly phosphorylated to guanosine triphosphate which competes with natural substrates to effectively inhibit hepatitis B viral polymerase; enzyme inhibition blocks reverse transcriptase activity thereby reducing viral DNA synthesis.
Pharmacodynamics/Kinetics

Distribution: Extensive (V_d in excess of body water)

Protein binding: ~13%

Metabolism: Minor hepatic glucuronide/sulfate conjugation

Half-life elimination: Terminal: ~5-6 days; accumulation: ~24 hours

Time to peak, plasma: 0.5-1.5 hours

Excretion: Urine (60% to 73% as unchanged drug)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause sedation

Mental Health: Effects on Psychiatric TreatmentNone reported

EPHEDrine

Lexi-Drugs Online

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

EPHEDrine may be confused with Epifrin®, EPINEPHrine

Pronunciation(e FED rin)
U.S. Brand NamesPretz-D® [OTC]
Pharmacologic CategoryAlpha/Beta Agonist
Use: Labeled IndicationsTreatment of bronchial asthma, nasal congestion, acute bronchospasm, idiopathic orthostatic hypotension, hypotension induced by spinal anesthesia
Dosing: Adults

Asthma, nasal congestion, acute bronchospasm, idiopathic orthostatic hypotension, hypotension induced by anesthesia:

Oral: 25-50 mg every 3-4 hours as needed

I.M., SubQ: 25-50 mg, parenteral adult dose should not exceed 150 mg in 24 hours

I.M.: 25 mg

I.V.: 5-25 mg/dose slow I.V. push repeated after 5-10 minutes as needed, then every 3-4 hours not to exceed 150 mg/24 hours

Nasal congestion: Nasal spray: 2-3 sprays into each nostril, not more frequently than every 4 hours

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Bronchospasm, nasal congestion:

Oral, SubQ: 3 mg/kg/day or 25-100 mg/m^2/day in 4-6 divided doses every 4-6 hours

I.M., slow I.V. push: 0.2-0.3 mg/kg/dose every 4-6 hours

Nasal congestion: Nasal spray:

Children 6-12 years: 1-2 sprays into each nostril, not more frequently than every 4 hours

Children ≥12 years: Refer to adult dosing.

Calculations

- Body Surface Area: Pediatrics

Administration: I.V.Do not administer unless solution is clear.
Administration: I.V. DetailpH: 4.5-7.0
StorageProtect all dosage forms from light.
CompatibilityStable in dextran 6% in dextrose, dextran 6% in NS, D_5LR, $D_5{}^1/_4NS$, $D_5{}^1/_2NS$, D_5NS, D_5W, $D_{10}W$, LR, ${}^1/_2NS$, NS.

Y-site administration: Compatible: Etomidate, propofol. **Incompatible:** Thiopental.

Compatibility in syringe: Compatible: Pentobarbital. **Incompatible:** Thiopental.

Compatibility when admixed: Compatible: Chloramphenicol, lidocaine, metaraminol, nafcillin, penicillin G potassium. **Incompatible:** Hydrocortisone sodium succinate, pentobarbital, phenobarbital. **Variable (consult detailed reference):** Thiopental.

ContraindicationsHypersensitivity to ephedrine or any component of the formulation; cardiac arrhythmias; angle-closure glaucoma; concurrent use of other sympathomimetic agents
Warnings/Precautions

Concerns related to adverse effects:

- Hypertension: May cause hypertension.
- Psychiatric disorders: Long-term use may cause anxiety and symptoms of paranoid schizophrenia.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease such as coronary artery disease, arrhythmias, and hypertension.

- Diabetes: Use with caution in patients with diabetes mellitus.

- Prostatic hyperplasia/urinary stricture: Use with caution in patients with prostatic hyperplasia and/or urinary stricture.

- Seizures: Use with caution in patients with a history of seizure disorder.

- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

- Vasomotor symptoms: Use with caution in patients with unstable vasomotor symptoms.

Concurrent drug therapy issues:

- Monoamine oxidase inhibitors (MAO-I): Use with extreme caution in patients taking MAO inhibitors; prolonged hypertension may result from concurrent use.

Special populations:

- Elderly: Use with caution in the elderly, since it crosses the blood-brain barrier and may cause confusion.

Dosage form specific issues:

- Injectable: Blood volume depletion should be corrected before I.V./I.M. therapy is instituted.

Other warnings/precautions:

- Bronchodilator use: Avoid as a bronchodilator; generally not used as a bronchodilator since other beta$_2$-agents are less toxic.

Geriatric ConsiderationsAvoid as a bronchodilator. Use caution since it crosses the blood-brain barrier and may cause confusion.
Pregnancy Risk FactorC
LactationEnters breast milk/not recommended
Adverse ReactionsFrequency not defined.

Cardiovascular: Arrhythmias, chest pain, elevation or depression of blood pressure, hypertension, palpitation, tachycardia, unusual pallor

Central nervous system: Agitation, anxiety, apprehension, CNS stimulating effects, dizziness, excitation, fear, headache hyperactivity, insomnia, irritability, nervousness, restlessness, tension

Gastrointestinal: Anorexia, GI upset, nausea, vomiting, xerostomia

Genitourinary: Painful urination

Neuromuscular & skeletal: Trembling, tremor (more common in the elderly), weakness

Respiratory: Dyspnea

Miscellaneous: Diaphoresis increased

Drug Interactions

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the tachycardic effect of Alpha-/Beta-Agonists. Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor) may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid ephedra, yohimbe (may cause CNS stimulation).
Test InteractionsCan cause a false-positive amphetamine EMIT assay
Monitoring ParametersInjection solution: Monitor blood pressure, pulse
Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Monitor therapeutic effectiveness and adverse reactions when initiating therapy and at regular intervals with long-term therapy. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.
Patient EducationUse this medication exactly as directed; do not take more than recommended dosage. Avoid other stimulant prescriptive or OTC medications to avoid serious overdose reactions. Store this medication away from light. You may experience dizziness, blurred vision, restlessness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or difficulty urinating (empty bladder immediately before taking this medication). Report excessive nervousness or excitation, inability to sleep, facial flushing, pounding

heartbeat, muscle tremors or weakness, chest pain or palpitations, bronchial irritation or coughing, or increased sweating. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, as sulfate: 25 mg

Injection, solution, as sulfate: 50 mg/mL (1 mL, 10 mL)

Solution, intranasal spray, as sulfate (Pretz-D®): 0.25% (50 mL)

Generic AvailableYes

Mechanism of ActionReleases tissue stores of epinephrine and thereby produces an alpha- and beta-adrenergic stimulation; longer-acting and less potent than epinephrine

Pharmacodynamics/Kinetics

Onset of action: Oral: Bronchodilation: 0.25-1 hour

Duration: Oral: 3-6 hours

Distribution: Crosses placenta; enters breast milk

Metabolism: Minimally hepatic

Half-life elimination: 2.5-3.6 hours

Excretion: Urine (60% to 77% as unchanged drug) within 24 hours

Related Information

- Contrast Media Reactions, Premedication for Prophylaxis

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation)

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse vasoconstrictor with caution since ephedrine may enhance cardiostimulation and vasopressor effects of sympathomimetics such as epinephrine

Mental Health: Effects on Mental StatusNervousness, anxiety, agitation, restlessness, and insomnia are common

Mental Health: Effects on Psychiatric TreatmentUse with MAO inhibitors may produce hypertensive crisis; avoid combination

Anesthesia and Critical Care Concerns/Other ConsiderationsFor I.V. administration, give the undiluted injection slowly. Additional I.V. doses may be given every 5-10 minutes if needed. Do not exceed adult parenteral dose of 150 mg/24 hours. Do not exceed pediatric dose of 3 mg/kg/24 hours. Use the smallest effective dose. Anesthesiologists may administer to treat nausea and vomiting in adults that has failed traditional antiemetic therapy and might be caused by hypotension (Gan, 2003).

Index TermsEphedrine Sulfate

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(ep i NAS teen)
U.S. Brand NamesElestat™
Pharmacologic CategoryHistamine H_1 Antagonist; Histamine H_1 Antagonist, Second Generation
Use: Labeled IndicationsTreatment of allergic conjunctivitis
Dosing: AdultsAllergic conjunctivitis: Ophthalmic: Instill 1 drop into each eye twice daily. Continue throughout period of exposure, even in the absence of symptoms.
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricAllergic conjunctivitis: Ophthalmic: Children ≥3 years: Refer to adult dosing.
Administration: OtherFor ophthalmic use only; avoid touching tip of applicator to eye or other surfaces. Contact lenses should be removed prior to application, may be reinserted after 10 minutes. Do not wear contact lenses if eyes are red.
StorageStore at controlled room temperature of 15°C to 25°C (59°F to 77°F). Keep tightly closed.
ContraindicationsHypersensitivity to epinastine or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Bacterial keratitis: Inadvertent contamination of multiple-dose ophthalmic solutions has caused bacterial keratitis.

Special populations:

- Contact lens wearers: Contains benzalkonium chloride which may be absorbed by contact lenses; remove contact lenses prior to use and wait 15 minutes before reinserting.

- Pediatrics: Safety and efficacy have not been established in children <3 years of age.

Other warnings/precautions:

- Appropriate use: For topical ophthalmic use only. Not for the treatment of contact lens irritation; do not wear contact lenses if eye is red.

Geriatric ConsiderationsNo difference in safety and efficacy was observed between elderly and younger patients.
Pregnancy Risk FactorC
Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions1% to 10%:

Central nervous system: Headache (1% to 3%)

Ocular: Burning sensation, folliculosis, hyperemia, pruritus

Respiratory: Cough (1% to 3%), pharyngitis (1% to 3%), rhinitis (1% to 3%), sinusitis (1% to 3%)

Miscellaneous: Infection (10%; defined as cold symptoms and upper respiratory infection)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Nursing: Physical Assessment/MonitoringFor ophthalmic use only. Assess therapeutic effectiveness and adverse reactions on a regular basis throughout therapy. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.
Patient EducationFor ophthalmic use only. Use exactly as directed. Do not wear contact lenses if eyes are red. May cause headache (consult prescriber for analgesic if persistent). Report unusual or persistent cough of cold symptoms related to use, or if condition does not improve. Wash hands before using. Remove contact lenses before application (may be reinserted after 10 minutes). Gently pull lower eyelid forward and instill prescribed amount in lower eyelid. Avoid touching tip of dropper to eye. Close eye and roll eyeball in all directions. May cause blurred vision, temporary stinging or burning sensation.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, ophthalmic, as hydrochloride: 0.05% (5 mL) [contains benzalkonium chloride]

Generic AvailableNo
ManufacturerAllergan, Inc
Pricing: U.S. (www.drugstore.com)

Solution (Elestat)

0.05% (5): $90.94

Mechanism of ActionSelective H_1-receptor antagonist; inhibits release of histamine from the mast cell
Pharmacodynamics/Kinetics

Onset of action: 3-5 minutes

Duration: 8 hours

Absorption: Low systemic absorption following topical application

Distribution: Does not cross blood-brain barrier

Protein binding: 64%

Metabolism: <10% metabolized

Half-life elimination: 12 hours

Excretion: I.V.: Urine (55%); feces (30%)

Pronunciation(ep i NEF rin, ra SEE mik and a LOO mi num poe TASS ee um SUL fate)
U.S. Brand NamesVan R Gingibraid®
Pharmacologic CategoryAdrenergic Agonist Agent; Alpha/Beta Agonist; Astringent; Vasoconstrictor
Use: DentalGingival retraction
Dosing: AdultsGingival retraction: Pass the impregnated yarn around the neck of the tooth and place into gingival sulcus; normal tissue moisture, water, or gingival retraction solutions activate impregnated yarn. Limit use to one quadrant of the mouth at a time; recommended use is for 3-8 minutes in the mouth.
Dosing: ElderlyRefer to adult dosing.
ContraindicationsHypersensitivity to epinephrine or any component of the formulation; cardiovascular disease, hyperthyroidism, or diabetes; do not apply to areas of heavy or deep bleeding or over exposed bone
Warnings/Precautions

Other warnings/precautions:

- Appropriate use: Caution should be exercised whenever using gingival retraction cords with epinephrine since it delivers vasoconstrictor doses of racemic epinephrine to patients; the general medical history should be thoroughly evaluated before using in any patient.

Adverse ReactionsNo data reported.
Drug InteractionsNo data reported.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Yarn, saturated in solution of 8% racemic epinephrine and 7% aluminum potassium sulfate:

Type “0e”: 0.20 ± 0.10 mg epinephrine/inch

Type “1e”: 0.40 ± 0.20 mg epinephrine/inch

Type “2e”: 0.60 ± 0.20 mg epinephrine/inch

Generic AvailableNo
Mechanism of ActionEpinephrine stimulates alpha$_1$ adrenergic receptors to cause vasoconstriction in blood vessels in gingiva; aluminum potassium sulfate, precipitates tissue and blood proteins
Pharmacodynamics/KineticsNo data reported.
Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Tissue retraction around base of the tooth (therapeutic effect)..
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported
Index TermsAluminum Potassium Sulfate and Epinephrine (Racemic) (Dental)

Epinephrine and Chlorpheniramine

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(ep i NEF rin & klor fen IR a meen)

U.S. Brand NamesAna-Kit速

Pharmacologic CategoryAntidote

Use: Labeled IndicationsAnaphylaxis emergency treatment of insect bites or stings by the sensitive patient that may occur within minutes of insect sting or exposure to an allergic substance

Dosing: AdultsInsect stings (Children and Adults): I.M. or SubQ:

Epinephrine:

<2 years: 0.05-0.1 mL

2-6 years: 0.15 mL

6-12 years: 0.2 mL

>12 years : 0.3 mL

Chlorpheniramine:

<6 years: 1 tablet

6-12 years: 2 tablets

>12 years: 4 tablets

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to adult dosing.

StorageStore at room temperature; do not freeze. Protect from light.

Pregnancy ConsiderationsRefer to Epinephrine monograph.

Metabolism/Transport EffectsChlorpheniramine: **Substrate** of CYP2D6 (minor), 3A4 (major); **Inhibits** CYP2D6 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the tachycardic effect of Alpha-/Beta-Agonists. Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor) may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Beta-Blockers: May enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Epinephrine used as a local anesthetic for dental procedures will not likely cause clinically relevant problems. *Risk D: Consider therapy modification*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

COMT Inhibitors: May decrease the metabolism of COMT Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Inhalational Anesthetics: May enhance the arrhythmogenic effect of EPINEPHrine. *Risk D: Consider therapy modification*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Primarily with oral administration of phenylephrine. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Kit: Epinephrine hydrochloride 1:1000 [prefilled syringe, delivers two 0.3 mL doses; contains sodium bisulfite] (1 mL), chlorpheniramine maleate chewable tablet 2 mg (4), sterile alcohol pads [isopropyl alcohol 70%] (2), tourniquet (1)

Generic AvailableNo

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause nervousness or restlessness

Mental Health: Effects on Psychiatric TreatmentNone reported. However, use cautiously with psychotropics that block alpha-receptors (phenothiazines); may produce paradoxical hypotension.

Medication Safety Issues

Sound-alike/look-alike issues:

EPINEPHrine may be confused with ePHEDrine

Epifrin® may be confused with ephedrine, EpiPen®

EpiPen® may be confused with Epifrin®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Medication errors have occurred due to confusion with epinephrine products expressed as ratio strengths (eg, 1:1000 vs 1:10,000).

Epinephrine 1:1000 = 1 mg/mL and is most commonly used I.M.

Epinephrine 1:10,000 = 0.1 mg/mL and is used I.V.

International issues:

EpiPen® may be confused with Epigen® which is a brand name for glycyrrhizinic acid in Mexico

EpiPen® may be confused with Epopen® which is a brand name for epoetin alfa in Spain

Pronunciation(ep i NEF rin)

U.S. Brand NamesAdrenalin®; EpiPen®; EpiPen® Jr; Primatene® Mist [OTC]; Raphon [OTC]; S2® [OTC]; Twinject™

Canadian Brand NamesAdrenalin®; EpiPen®; EpiPen® Jr; Twinject™

Pharmacologic CategoryAlpha/Beta Agonist; Antidote

Use: Labeled IndicationsTreatment of bronchospasms, bronchial asthma, nasal congestion, viral croup, anaphylactic reactions, cardiac arrest; added to local anesthetics to decrease systemic absorption of local anesthetics and increase duration of action; decrease superficial hemorrhage

Use: Unlabeled/InvestigationalACLS guidelines: Ventricular fibrillation (VF) or pulseless ventricular tachycardia (VT) unresponsive to initial defibrillatory shocks; pulseless electrical activity, asystole, hypotension unresponsive to volume resuscitation; symptomatic bradycardia or hypotension unresponsive to atropine or pacing; inotropic support

Use: DentalEmergency drug for treatment of anaphylactic reactions; used as vasoconstrictor to prolong local anesthesia

Dosing: Adults

Asystole/pulseless arrest, bradycardia, VT/VF:

I.V., I.O.: 1 mg every 3-5 minutes; if this approach fails, higher doses of epinephrine (up to 0.2 mg/kg) may be indicated for treatment of specific problems (eg, beta-blocker or calcium channel blocker overdose)

Intratracheal: Administer 2-2.5 mg for VF or pulseless VT if I.V./I.O. access is delayed or cannot be established; dilute in 5-10 mL NS or distilled water. **Note:** Absorption is greater with distilled water, but causes more adverse effects on PaO_2.

Bradycardia (symptomatic) or hypotension (not responsive to atropine or pacing):*I.V. infusion:* 2-10 mcg/minute; titrate to desired effect

Bronchodilator:

SubQ: 0.3-0.5 mg **(1:1000)** every 20 minutes for 3 doses

Nebulization: 1-3 inhalations up to every 3 hours using solution prepared with 10 drops of the **1:100** product (solution for oral inhalation [Adrenalin®])

S2® (racepinephrine, OTC labeling): 0.5 mL up to every 3-4 hours if needed. Solution should be diluted if using jet nebulizer.

Inhalation: Primatene® Mist (OTC labeling): One inhalation, wait at least 1 minute; if not relieved, may use once more. Do not use again for at least 3 hours.

Decongestant:*Intranasal:* Apply 1:1000 locally as drops or spray or with sterile swab

Hypersensitivity reaction:

SubQ, I.M.: 0.3-0.5 mg (1:1000) every 15-20 minutes if condition requires (I.M. route is preferred)

I.V.: 0.1 mg (1:10,000) over 5 minutes. May infuse at 1-4 mcg/minute to prevent the need to repeat injections frequently.

Self-administration following severe allergic reactions (eg, insect stings, food): **Note:** The World Health Organization (WHO) and Anaphylaxis Canada recommend the availability of one dose for every 10 to 20 minutes of travel time to a medical emergency facility. More than 2 doses should only be administered under direct medical supervision.

Twinject™: SubQ, I.M.: 0.3 mg

EpiPen®: I.M.: 0.3 mg

Shock, fluid-resistant (unlabeled use): *I.V. infusion:* 2-10 mcg/minute, titrate dose to blood pressure effect (AHA, 2005)

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Cardiac arrest: I.V.: Neonates: 0.01-0.03 mg/kg (0.1-0.3 mL/kg of **1:10,000** solution) every 3-5 minutes as needed. Although I.V. route is preferred, may consider administration of doses up to 0.1 mg/kg through the endotracheal tube until I.V. access established; dilute intratracheal doses to 1-2 mL with normal saline.

Asystole/pulseless arrest, bradycardia, VT/VF (after failed defibrillations):

I.V., I.O.: Infants and Children: 0.01 mg/kg (0.1 mL/kg of **1:10,000** solution) every 3-5 minutes as needed (maximum: 1 mg)

Intratracheal: Infants and Children: 0.1 mg/kg (0.1 mL/kg of **1:1000** solution) every 3-5 minutes (maximum: 10 mg)

Continuous I.V. infusion: Infants and Children: 0.1-1 mcg/kg/minute; doses <0.3 mcg/kg/minute generally produce β-adrenergic effects and higher doses generally produce α-adrenergic vasoconstriction; titrate dosage to desired effect

Bronchodilator:

SubQ: Infants and Children: 0.01 mg/kg (0.01 mL/kg of **1:1000**) (single doses not to exceed 0.5 mg) every 20 minutes for 3 doses

Nebulization:

Infants and Children: 1-3 inhalations up to every 3 hours using solution prepared with 10 drops of **1:100** (solution for oral inhalation [Adrenalin®])

Children <4 years: S2® (racepinephrine, OTC labeling): Croup: 0.05 mL/kg (max 0.5 mL/dose); dilute in NS 3 mL. Administer over ~15 minutes; do not administer more frequently than every 2 hours.

Inhalation: Children ≥4 years: Primatene® Mist: Refer to adult dosing.

Decongestant: Children ≥6 years: Refer to adult dosing.

Hypersensitivity reaction:

SubQ, I.V.: 0.01 mg/kg every 20 minutes; larger doses or continuous infusion may be needed for some anaphylactic reactions

Self-administration following severe allergic reactions (eg, insect stings, food): **Note:** World Health Organization (WHO) and Anaphylaxis Canada recommend the availability of 1 dose for every 10-20 minutes of travel time to a medical emergency facility:

Twinject™: SubQ, I.M.:

Children 15-30 kg: 0.15 mg

Children >30 kg: 0.3 mg

EpiPen® Jr: I.M.: Children <30 kg: 0.15 mg

EpiPen®: I.M.: Children ≥30 kg: 0.3 mg

Shock, fluid-resistant (unlabeled use): *Continuous I.V. infusion:* 0.1-1 mcg/kg/minute; doses up to 5 mcg/kg/minute may rarely be necessary (Hegenbarth, 2008)

Calculations

- Epinephrine
- Epinephrine, Weight-Based

Administration: I.M.I.M. administration into the buttocks should be avoided.

Administration: I.V.Central line administration only. I.V. infusions require an infusion pump. Epinephrine solutions for injection can be administered SubQ, I.M., I.V., I.O.

Administration: I.V. Detail **Extravasation management:** Use phentolamine as antidote. Mix 5 mg with 9 mL of NS. Inject a small amount of this dilution into extravasated area. Blanching should reverse immediately. Monitor site. If blanching should recur, additional injections of phentolamine may be needed.

pH: 2.5-5.0

Administration: InhalationS2®: Administer over ~15 minutes; must be diluted if using jet nebulizer.

Administration: OtherIntratracheal: Dilute in NS or distilled water. Absorption is greater with distilled water, but causes more adverse effects on PaO_2. Pass catheter beyond tip of tracheal tube, stop compressions, spray drug quickly down tube. Follow immediately with several quick insufflations and continue chest compressions.

StorageEpinephrine is sensitive to light and air. Protection from light is recommended. Oxidation turns drug pink, then a brown color. **Solutions should not be used if they are discolored or contain a precipitate.**

Adrenalin®: Store between 15°C to 25°C (59°F to 77°F); do not freeze. Protect from light. The 1:1000 solution should be discarded 30 days after initial use.

Raphon: Store between 2°C to 25°C (36°F to 77°F). Refrigerate after opening.

Twinject™: Store between 20°C to 25°C (68°F to 77°F); do not freeze or refrigerate. Protect from light.

Stability of injection of parenteral admixture at room temperature (25°C) or refrigeration (4°C) is 24 hours.

Reconstitution

Standard I.V. diluent: 1 mg/250 mL NS.

Preparation of adult I.V. infusion: Dilute 1 mg in 250 mL of D_5W or NS (4 mcg/mL).

S2®: Dilution not required when administered via hand-nebulizer; dilute with NS 3-5 mL if using jet nebulizer.

CompatibilityStable in dextran 6% in dextrose, dextran 6% in NS, D_5LR, $D_5{}^1/_4NS$, $D_5{}^1/_2NS$, D_5NS, D_5W, $D_{10}W$, $D_{10}NS$, LR, NS; **incompatible** with sodium bicarbonate 5%.

Y-site administration: Compatible: Atracurium, calcium chloride, calcium gluconate, cisatracurium, diltiazem, dobutamine, dopamine, famotidine, fentanyl, furosemide, heparin, hydrocortisone sodium succinate, hydromorphone, inamrinone, labetalol, levofloxacin, lorazepam, midazolam, milrinone, morphine, nicardipine, nitroglycerin, norepinephrine, pancuronium, phytonadione, potassium chloride, propofol, ranitidine, remifentanil, vecuronium, vitamin B complex with C, warfarin. **Incompatible:** Ampicillin, thiopental.

Compatibility in syringe: Compatible: Diatrizoate meglumine 52%, diatrizoate sodium 8%, diatrizoate sodium 60%, doxapram, heparin, iohexol, iopamidol, iothalamate meglumine 60%, ioxaglate 39.3%, ioxaglate sodium 19.6%, milrinone. **Variable (consult detailed reference):** Sodium bicarbonate.

Compatibility when admixed: Compatible: Amikacin, bupivacaine, cimetidine, dobutamine, fentanyl, floxacillin, furosemide, metaraminol, ranitidine, verapamil. **Incompatible:** Aminophylline, hyaluronidase, mephentermine, sodium bicarbonate.

ContraindicationsHypersensitivity to epinephrine or any component of the formulation; cardiac arrhythmias; angle-closure glaucoma

Warnings/Precautions

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular diseases (angina, tachycardia, myocardial infarction).
- Cerebrovascular disease: Use with caution in patients with cerebrovascular disease.
- Diabetes: Use with caution in patients with diabetes mellitus.
- Parkinson's disease: Use with caution in patients with Parkinson's disease.
- Thyroid disease: Use with caution in patients with thyroid disease.

Concurrent drug therapy issues:

- Monoamine oxidase inhibitors (MAO-I): Use with extreme caution in patients taking MAO inhibitors; prolong hypertension may result from concurrent use.

Special populations:

- Elderly: Use with caution in the elderly.

Dosage form specific issues:

- I.V. infusion: Rapid I.V. infusion may cause death from cerebrovascular hemorrhage or cardiac arrhythmias.
- Oral inhalation: Oral inhalation of epinephrine is **not** the preferred route of administration.
- Sulfites: Some products contain sulfites as preservatives.
- Topical: Avoid topical application where reduced perfusion could lead to ischemic tissue damage (eg, penis, ears, digits).

Geriatric ConsiderationsThe use of epinephrine in the treatment of acute exacerbations of asthma was studied in the elderly. A dose of 0.3 mg SubQ every 20 minutes for three doses was well tolerated in elderly patients with no history of angina or recent myocardial infarction. There was no significant difference in the incidence of ventricular arrhythmias in elderly versus younger adults.

Pregnancy Risk FactorC

Pregnancy ConsiderationsCrosses the placenta. Reported association with malformations in 1 study; may be secondary to severe maternal disease.

LactationExcretion in breast milk unknown

Adverse ReactionsFrequency not defined.

Cardiovascular: Angina, cardiac arrhythmia, chest pain, flushing, hypertension, increased myocardial oxygen consumption, pallor, palpitation, sudden death, tachycardia (parenteral), vasoconstriction, ventricular ectopy

Central nervous system: Anxiety, dizziness, headache, insomnia, lightheadedness, nervousness, restlessness

Gastrointestinal: Dry throat, nausea, vomiting, xerostomia

Genitourinary: Acute urinary retention in patients with bladder outflow obstruction

Neuromuscular & skeletal: Trembling, weakness

Ocular: Allergic lid reaction, burning, eye pain, ocular irritation, precipitation of or exacerbation of narrow-angle glaucoma, transient stinging

Renal: Decreased renal and splanchnic blood flow

Respiratory: Dyspnea, wheezing

Miscellaneous: Diaphoresis increased

Drug Interactions

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the tachycardic effect of Alpha-/Beta-Agonists. Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor) may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Beta-Blockers: May enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Epinephrine used as a local anesthetic for dental procedures will not likely cause clinically relevant problems. *Risk D: Consider therapy modification*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

COMT Inhibitors: May decrease the metabolism of COMT Substrates. *Risk C: Monitor therapy*

Inhalational Anesthetics: May enhance the arrhythmogenic effect of EPINEPHrine. *Risk D: Consider therapy modification*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Primarily with oral administration of phenylephrine. *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid ephedra, yohimbe (may cause CNS stimulation).

Test InteractionsIncreased bilirubin (S), catecholamines (U), glucose, uric acid (S)

Monitoring ParametersPulmonary function, heart rate, blood pressure, site of infusion for blanching, extravasation; cardiac monitor and blood pressure monitor required. If using to treat hypotension, assess intravascular volume and support as needed.

Reference RangeTherapeutic: 31-95 pg/mL (SI: 170-520 pmol/L)

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Monitor therapeutic effectiveness (according to purpose for use) and adverse reactions. Monitor vital signs. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report. I.V. central line with infusion pump and continuous cardiac/hemodynamic monitoring is necessary.

Patient EducationUse this medication exactly as directed; do not take more than recommended dosage. Avoid other stimulant prescriptive or OTC medications to avoid serious overdose reactions. You may experience dizziness, blurred vision, restlessness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or difficulty urinating (empty bladder immediately before taking this medication). Report excessive nervousness or excitation, inability to sleep, facial flushing, pounding heartbeat, muscle tremors or weakness, chest pain or palpitations, bronchial irritation or coughing, or increased sweating.

Aerosol: Use aerosol or nebulizer as per instructions. Clear as much mucus as possible before use. Rinse mouth following each use. If more than one inhalation is necessary, wait 1 minute between inhalations. May cause restlessness or nervousness; use caution when driving or engaging in hazardous activities until response to medication is known. Report persistent nervousness, restlessness, sleeplessness, palpitations, tachycardia, chest pain, muscle tremors, dizziness, flushing, or if breathing difficulty persists.

Pregnancy/breast-feeding precautions: Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Aerosol for oral inhalation:

Primatene® Mist: 0.22 mg/inhalation (15 mL, 22.5 mL) [contains CFCs]

Injection, solution [prefilled auto injector]:

EpiPen®: 0.3 mg/0.3 mL (2 mL) [1:1000 solution; delivers 0.3 mg per injection; contains sodium metabisulfite; available as single unit or in double-unit pack with training unit]

EpiPen® Jr: 0.15 mg/0.3 mL (2 mL) [1:2000 solution; delivers 0.15 mg per injection; contains sodium metabisulfite; available as single unit or in double-unit pack with training unit]

Twinject™: 0.15 mg/0.15 mL (1.1 mL) [1:1000 solution; delivers 0.15 mg per injection; contains sodium bisulfite; two 0.15 mg doses per injector]; 0.3 mg/0.3 mL (1.1 mL) [1:1000 solution; delivers 0.3 mg per injection; contains sodium bisulfite; two 0.3 mg doses per injector]

Injection, solution, as hydrochloride: 0.1 mg/mL (10 mL) [1:10,000 solution]; 1 mg/mL (1 mL) [1:1000 solution]

Adrenalin®: 1 mg/mL (1 mL) [1:1000 solution; contains sodium bisulfite]

Adrenalin®: 1 mg/mL (30 mL) [1:1000 solution; contains chlorobutanol, sodium bisulfite]

Solution for oral inhalation, as hydrochloride:

Adrenalin®: 1% (7.5 mL) [10 mg/mL, 1:100 solution; contains sodium bisulfite]

Solution for oral inhalation [racepinephrine; preservative free]:

S2®: 2.25% (0.5 mL) [as d-epinephrine 1.125% and l-epinephrine 1.125%]

Solution, intranasal, as hydrochloride [drops, spray]:

Adrenalin®: 1 mg/mL [1:1000 solution; contains sodium bisulfite]

Solution, topical [racepinephrine]:

Raphon: 2.25% (15 mL) [as d-epinephrine 1.125% and l-epinephrine 1.125%; contains benzoic acid, metabisulfites]

Generic AvailableYes: Solution for injection

Pricing: U.S. (www.drugstore.com)

Mechanism of ActionStimulates alpha-, beta$_1$-, and beta$_2$-adrenergic receptors resulting in relaxation of smooth muscle of the bronchial tree, cardiac stimulation, and dilation of skeletal muscle vasculature; small doses can cause vasodilation via beta$_2$-vascular receptors; large doses may produce constriction of skeletal and vascular smooth muscle

Pharmacodynamics/Kinetics

Onset of action: Bronchodilation: SubQ: ~5-10 minutes; Inhalation: ~1 minute

Distribution: Crosses placenta

Metabolism: Taken up into the adrenergic neuron and metabolized by monoamine oxidase and catechol-o-methyltransferase; circulating drug hepatically metabolized

Excretion: Urine (as inactive metabolites, metanephrine, and sulfate and hydroxy derivatives of mandelic acid, small amounts as unchanged drug)

Pharmacotherapy PearlsTwinject® and EpiPen® are not interchangeable due to packaging considerations.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation) and dry throat.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNervousness and restlessness are common; may cause insomnia

Mental Health: Effects on Psychiatric TreatmentNone reported; however, use cautiously with psychotropics that block alpha-receptors (phenothiazines); may produce paradoxical hypotension

Anesthesia and Critical Care Concerns/Other Considerations

Septic Shock: Epinephrine's use may be limited by its effects on renal and gastric blood flow and its propensity to increase lactic acid concentrations.

Cardiac Arrest: Epinephrine can be given by endotracheal route during cardiac resuscitation. High-intravenous dose epinephrine (0.1 mg/kg) has not shown to improve survival or neurological outcomes. May have more postresuscitation complications than survivors who receive standard dose epinephrine. Eight randomized clinical studies (>9000 patients) have found no improvement in survival to hospital discharge or neurological outcomes compared with standard epinephrine.

A prospective, multicenter, double-blind randomized, controlled trial evaluated the efficacy of vasopressin or epinephrine when administered to adult patients who suffered an out-of-hospital cardiac arrest (Wenzel, 2004). For inclusions, patients presented with ventricular fibrillation, pulseless electrical activity, or asystole. They were excluded if they were successfully defibrillated without the administration of a vasopressor, had a terminal illness or had a DNR order, a lack of intravenous access, hemorrhagic shock, pregnancy, cardiac arrest due to trauma, or were <18 years of age. Eligible patients were randomized to intravenous vasopressin (40 units) or epinephrine (1 mg). Each patient received an injection of the study drug, if spontaneous circulation was not restored in 3 minutes they received a second dose (same amount) of the same study drug. If there was no response, the managing physician had the option of giving epinephrine. Patients with ventricular fibrillation were randomized after the first three attempts at defibrillation failed; all others were randomized immediately. The primary endpoint was survival to hospital admission; the secondary endpoint was survival to hospital discharge. Five hundred and eighty-nine patients were randomized to vasopressin and five hundred and ninety-seven patients were randomized to epinephrine. There was no significant difference in the rate of hospital admission between the vasopressin group and the epinephrine group if they had ventricular fibrillation (46.2% vs 43% respectively, p: 0.48) or pulseless electrical activity (33.7% vs 30.5% respectively, p: 0.65). Patients with asystole responded significantly better to vasopressin; having higher rates of hospital admission (29% vs 20.3% in the epinephrine group, p: 0.02) and hospital discharge (4.7% vs 1.5% in the epinephrine group, p: 0.04). Patients who failed vasopressin therapy and received additional epinephrine had significant improvement in survival to hospital admission (25.7% vs 16.4% in the epinephrine group, p: 0.002) and discharge (6.2% vs 1.7%, p: 0.002). Similar patients who were randomized to epinephrine and failed to respond did not improve with additional epinephrine. Cerebral performance among all patients who survived to discharge was similar in both groups. In this trial, vasopressin was superior to epinephrine in patients with asystole. Vasopressin followed by epinephrine may be more effective than epinephrine alone in refractory out-of-hospital cardiac arrest.

A small in-hospital cardiac arrest study evaluated the efficacy of vasopressin or epinephrine in 200 patients. These investigators did not find any differences between the two treatment groups with regard to survival, discharge, or cerebral performance (Stiell, 2001).

Index TermsAdrenaline; Epinephrine Bitartrate; Epinephrine Hydrochloride; Racepinephrine

English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Epirubicin may be confused with DOXOrubicin, DAUNOrubicin, idarubicin

Ellence® may be confused with Elase®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(ep i ROO bi sin)

U.S. Brand NamesEllence®

Canadian Brand NamesEllence®; Pharmorubicin®

Pharmacologic CategoryAntineoplastic Agent, Anthracycline

Use: Labeled IndicationsAdjuvant therapy for primary breast cancer

Dosing: AdultsI.V.: 100-120 mg/m^2 once weekly every 3-4 weeks **or** 50-60 mg/m^2 days 1 and 8 every 3-4 weeks

Breast cancer:

CEF-120: 60 mg/m^2 on days 1 and 8 every 28 days for 6 cycles

FEC-100: 100 mg/m^2 on day 1 every 21 days for 6 cycles

Note: Patients receiving 120 mg/m^2/cycle as part of combination therapy should also receive prophylactic therapy with sulfamethoxazole/trimethoprim or a fluoroquinolone.

Dosage modifications:

Delay day 1 dose until platelets are ≥100,000/mm^3, ANC ≥1500/mm^3, and nonhematologic toxicities have recovered to ≤grade 1

Reduce day 1 dose in subsequent cycles to 75% of previous day 1 dose if patient experiences nadir platelet counts <50,000/mm^3, ANC <250/mm^3, neutropenic fever, or grade 3/4 nonhematologic toxicity during the previous cycle

For divided doses (day 1 and day 8), reduce day 8 dose to 75% of day 1 dose if platelet counts are 75,000-100,000/mm^3 and ANC is 1000-1499/mm^3; omit day 8 dose if platelets are <75,000/mm^3, ANC <1000/mm^3, or grade 3/4 nonhematologic toxicity

Dosage adjustment in bone marrow dysfunction: Heavily-treated patients, patients with pre-existing bone marrow depression or neoplastic bone marrow infiltration: Lower starting doses (75-90 mg/mm^2) should be considered.

Dosing: ElderlyPlasma clearance of epirubicin in elderly female patients was noted to be reduced by 35%. Although no initial dosage reduction is specifically recommended, particular care should be exercised in monitoring toxicity and adjusting subsequent dosage in elderly patients (particularly females >70 years of age).

Dosing: Renal ImpairmentThe FDA-approved labeling recommends that in patients with severe renal impairment (serum creatinine >5 mg/dL), lower doses should be considered. Aronoff (2007) recommends no dosage adjustment needed for Cl_{cr} <50 mL/minute.

Dosing: Hepatic ImpairmentThe FDA-approved labeling recommends the following guidelines (based on clinical trial information):

Bilirubin 1.2-3 mg/dL or AST 2-4 times the upper limit of normal: Administer 50% of recommended starting dose.

Bilirubin >3 mg/dL or AST >4 times the upper limit of normal: Administer 25% of recommended starting dose.

Severe hepatic impairment: Use is contraindicated.

Dosing: Combination Regimens

Breast cancer:

CEF

Docetaxel-FEC

Docetaxel-Trastuzumab-FEC

FEC

Tamoxifen-Epirubicin

TEX (Capecitabine + Docetaxel + Epirubicin)

Vinorelbine-FEC

Vinorelbine-Trastuzumab-FEC

Esophageal cancer: Epirubicin-Oxaliplatin-Capecitabine

Gastric cancer:

ECF

Epirubicin-Oxaliplatin-Capecitabine

Rhabdomyosarcoma: CEV

Calculations

- ANC: Absolute Neutrophil Count
- Body Surface Area: Adults

Administration: I.V.Infuse over 15-20 minutes or slow I.V. push (for lower doses [due to dose modification or organ dysfunction]) over 3-10 minutes

StorageStore intact vials of solution under refrigeration at 2°C to 8°C (36°F to 46°F). Store intact vials of lyophilized powder at room temperature 15°C to 30°C (59°F to 86°F). Protect from light. Reconstituted solutions and solutions for infusion are stable for 24 hours when stored at 2°C to 8°C (36°F to 46°F).

Reconstitution Reconstitute lyophilized powder with SWFI to a final concentration of 2 mg/mL. May administer undiluted for IVP or dilute in 50-250 mL NS or D_5W for infusion.

CompatibilityStable in D_5W, LR, NS; **incompatible** with heparin, fluorouracil, or any solution of alkaline pH.

Compatibility in syringe: Compatible: Ifosfamide. **Incompatible:** Fluorouracil, heparin, ifosfamide with mesna, any solution of alkaline pH.

ContraindicationsHypersensitivity to epirubicin or any component of the formulation, other anthracyclines, or anthracenediones; previous anthracycline treatment up to maximum cumulative dose; severe myocardial insufficiency, severe arrhythmias; recent myocardial infarction; severe hepatic dysfunction; baseline neutrophil count 1500 cells/mm^3; pregnancy

Warnings/Precautions

Boxed warnings:

- Bone marrow suppression: See "Concerns related to adverse effects" below.
- Experienced physician: See "Other warnings/precautions" below.
- Hepatic impairment: See "Disease-related concerns" below.
- Myocardial toxicity: See "Concerns related to adverse effects" below.
- Secondary malignancy: See "Concerns related to adverse effects" below.
- Skin irritation/extravasation: See "Concerns related to adverse effects" below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: **[U.S. Boxed Warning]: May cause severe myelosuppression;** neutropenia is the dose-limiting toxicity; severe thrombocytopenia or anemia may occur.
- Myocardial toxicity: **[U.S. Boxed Warning]: May cause cumulative dose-related myocardial toxicity (concurrent or delayed);** particularly in patients who have received prior anthracyclines, prior or concomitant radiotherapy to the mediastinal/pericardial area, or who have pre-existing cardiac disease. Acute toxicity (primarily arrhythmias) and delayed toxicity (HF) have been described. Delayed toxicity usually develops late in the course of therapy or within 2-3 months after completion, however, events with an onset of several months to years after termination of treatment have been described. The risk of delayed cardiotoxicity increases more steeply with cumulative doses >900 mg/m^2, and this dose should be exceeded only with extreme caution. (The risk of HF is ~0.9% at a cumulative dose of 550 mg/m^2, ~1.6% at a cumulative dose of 700 mg/m^2, and ~3.3% at a cumulative dose of 900 mg/m^2.) Toxicity may be additive with other anthracyclines or anthracenediones, and may be increased in pediatric patients. Regular monitoring of LVEF and discontinuation at the first sign of impairment is recommended especially in patients with cardiac risk factors or impaired cardiac function.
- Secondary malignancy: **[U.S. Boxed Warning]: Treatment with anthracyclines may increase the risk of secondary leukemias.**
- Skin irritation/extravasation: **[U.S. Boxed Warning]: For I.V. administration only. Vesicant; if extravasation occurs, severe local tissue damage and necrosis may occur.**
- Thromboembolic events: Thrombophlebitis and thromboembolic phenomena (including pulmonary embolism) have occurred.

- Tumor lysis syndrome: May cause tumor lysis syndrome.

Disease-related concerns:

- Hepatic impairment: **[U.S. Boxed Warning]: Use with caution in patients with mild-to-moderate hepatic impairment;** dosage reduction is recommended.
- Renal impairment: Use with caution in patients with renal impairment (serum creatinine >5 mg/dL).

Special populations:

- Elderly: Women ≥70 years of age should be especially monitored for toxicity.
- Pediatrics: Safety and efficacy have not been established in children.
- Pregnancy: Women of childbearing age should be advised to avoid becoming pregnant.
- Radiation recipients: Epirubicin may have radiosensitizing activity; radiation recall has also been reported.

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician.**

Pregnancy Risk FactorD

Pregnancy ConsiderationsTeratogenic effects and embryotoxicity were noted in animal studies. There are no adequate and well-controlled studies in pregnant women. If a pregnant woman is treated with epirubicin, or if a woman becomes pregnant while receiving this drug, she should be informed of the potential hazard to the fetus. Women of childbearing potential should be advised to avoid becoming pregnant. Men undergoing treatment should use effective contraception.

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsExcretion in human breast milk is unknown, however, other anthracyclines are excreted. Breast-feeding is contraindicated.

Adverse ReactionsPercentages reported as part of combination chemotherapy regimens.

>10%:

Central nervous system: Lethargy (1% to 46%)

Dermatologic: Alopecia (69% to 96%)

Endocrine & metabolic: Amenorrhea (69% to 72%), hot flashes (5% to 39%)

Gastrointestinal: Nausea/vomiting (83% to 92%), mucositis (9% to 59%), diarrhea (7% to 25%)

Hematologic: Leukopenia (50% to 80%; grades 3/4: 2% to 59%), neutropenia (54% to 80%; grades 3/4: 11% to 67%; nadir: 10-14 days; recovery: 21 days), anemia (13% to 72%; grades 3/4: 6%), thrombocytopenia (5% to 49%; grades 3/4: 5%)

Local: Injection site reactions (3% to 20%)

Ocular: Conjunctivitis (1% to 15%)

Miscellaneous: Infection (15% to 21%)

1% to 10%:

Cardiovascular: CHF (0.4% to 1.5%), decreased LVEF (asymptomatic) (1% to 2%); recommended maximum cumulative dose: 900 mg/m^2

Central nervous system: Fever (1% to 5%)

Dermatologic: Rash (1% to 9%), skin changes (1% to 5%)

Gastrointestinal: Anorexia (2% to 3%)

Hematologic: Neutropenic fever (grades 3/4: 6%)

<1%, postmarketing, case reports, and/or frequency not defined: Acute lymphoid leukemia; acute myelogenous leukemia (0.3% at 3 years, 0.5% at 5 years, 0.6% at 8 years); anaphylaxis, atrioventricular block, bradycardia, bundle-branch block, cardiomyopathy, ECG abnormalities, hypersensitivity, myelodysplastic syndrome, photosensitivity, premature menopause, premature ventricular contractions, pulmonary embolism, radiation recall, sinus tachycardia, skin and nail hyperpigmentation, ST-T wave changes (nonspecific), tachyarrhythmias, thromboembolism, thrombophlebitis, transaminases increased, urticaria, ventricular tachycardia

Oncology: VesicantYes

Oncology: Emetic PotentialModerate-to-high (30% to 90%)

Drug Interactions

Bevacizumab: May enhance the cardiotoxic effect of Antineoplastic Agents (Anthracycline). *Risk C: Monitor therapy*

Cardiac Glycosides: May diminish the cardiotoxic effect of Antineoplastic Agents (Anthracycline). Antineoplastic Agents (Anthracycline) may decrease the serum concentration of Cardiac Glycosides. The effects of liposomal formulations may be unique from those of the free drug, as liposomal formulation have unique drug disposition and toxicity profiles, and liposomes themselves may alter digoxin absorption/distribution. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Taxane Derivatives: May enhance the adverse/toxic effect of Antineoplastic Agents (Anthracycline). Taxane Derivatives may increase the serum concentration of Antineoplastic Agents (Anthracycline). Taxane Derivatives may also increase the formation of toxic anthracycline metabolites in heart tissue. *Risk D: Consider therapy modification*

Trastuzumab: May enhance the cardiotoxic effect of Antineoplastic Agents (Anthracycline). *Risk D: Consider therapy modification*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (due to GI irritation).

Herb/Nutraceutical: Avoid black cohosh, dong quai in estrogen-dependent tumors.

Monitoring ParametersMonitor injection site during infusion for possible extravasation or local reactions; CBC with differential and platelet count, liver function tests, renal function, ECG, and left ventricular ejection fraction. Monitor during therapy for potential cardiotoxicity with ECHO or with MUGA scans (patients with higher cumulative doses).

Nursing: Physical Assessment/MonitoringAssess potential for interactions with herbal products patient may taking (see Nutritional/Ethanol Interactions). Note infusion specifics in Administration. Premedication with an antiemetic may be useful (emetogenic). Infusion site must be monitored closely to prevent extravasation; severe local tissue necrosis will result if extravasation occurs. Evaluate results of laboratory tests and patient response prior to each treatment and on a regular basis during therapy (eg, acute nausea and vomiting, anemia, infection, bleeding, and cardiotoxicity) (Note: cardiotoxicity may occur 1 to several months after termination of treatment). Teach patient possible side effects/appropriate interventions (eg, importance of adequate hydration) and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential and platelet count, liver function tests, renal function, ECG, and left ventricular ejection fraction (baseline and repeated measurement). The method used for assessment of LVEF (echocardiogram or MUGA) should be consistent during routine monitoring.

Patient EducationDo not take any new prescription or over-the-counter medications or herbal products during therapy unless approved by prescriber. This medication can only be administered by infusion. Report immediately any swelling, pain, burning, or redness at infusion site, sudden difficulty breathing or swallowing, chest pain, or chills. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake, and adequate nutrition (small, frequent meals may help). You will be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). May cause nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); diarrhea (buttermilk, boiled milk, or yogurt may help); loss of hair (reversible); hyperpigmentation of skin or nails; mouth sores (frequent mouth care, soft toothbrush may help); or changes in menstrual cycle (consult prescriber). Report chest pain, swelling of extremities, palpitations, or rapid heartbeat; respiratory difficulty or unusual cough; pain, redness, unusual warmth in extremities; unresolved nausea, vomiting, or diarrhea; alterations in urinary pattern (increased or decreased); opportunistic infection (fever, chills, unusual bruising or bleeding, fatigue, purulent vaginal discharge, unhealed mouth sores); skin rash; abdominal pain; blood in urine or stool; or other unresolved reactions. **Pregnancy/breast-feeding precautions:** Female: Do not get pregnant while taking this medication and for 1 month following therapy. Male undergoing treatment: Do not cause a pregnancy. This drug may cause severe fetal defects. Consult prescriber for appropriate barrier contraceptives. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution, as hydrochloride, [preservative free]: 50 mg, 200 mg [contains lactose]

Injection, solution, as hydrochloride [preservative free]: 2 mg/mL (5 mL, 25 mL, 75 mL, 100 mL)

Ellence®: 2 mg/mL (25 mL, 100 mL)

Generic AvailableYes

Mechanism of ActionEpirubicin is an anthracycline antibiotic; known to inhibit DNA and RNA synthesis by steric obstruction after intercalating between DNA base pairs; active throughout entire cell cycle. Intercalation triggers DNA cleavage by topoisomerase II, resulting in cytocidal activity. Also inhibits DNA helicase, and generates cytotoxic free radicals.

Pharmacodynamics/Kinetics

Distribution: V_{ss}: 21-27 L/kg

Protein binding: 77% to albumin

Metabolism: Extensively via hepatic and extrahepatic (including RBCs) routes

Half-life elimination: Triphasic; Mean terminal: 33 hours

Excretion: Feces (34% to 35%); urine (20% to 27%)

Medication Safety Issues

Sound-alike/look-alike issues:

Inspra™ may be confused with Spiriva®

Pronunciation(e PLER en one)

U.S. Brand NamesInspra™

Pharmacologic CategorySelective Aldosterone Blocker

Use: Labeled IndicationsTreatment of hypertension (may be used alone or in combination with other antihypertensive agents); treatment of heart failure (HF) following acute MI

Dosing: Adults

Hypertension: Oral: Initial: 50 mg once daily; may increase to 50 mg twice daily if response is not adequate; may take up to 4 weeks for full therapeutic response. Doses >100 mg/day are associated with increased risk of hyperkalemia and no greater therapeutic effect.

Dose modification during concurrent use with moderate CYP3A4 inhibitors: Initial: 25 mg once daily

Heart failure (post-MI): Oral: Initial: 25 mg once daily; dosage goal: Titrate to 50 mg once daily within 4 weeks, as tolerated

Dosage adjustment per serum potassium concentrations for HF (post-MI):

<5.0 mEq/L:

Increase dose from 25 mg every other day to 25 mg daily **or**

Increase dose from 25 mg daily to 50 mg daily

5.0-5.4 mEq/L: No adjustment needed

5.5-5.9 mEq/L:

Decrease dose from 50 mg daily to 25 mg daily **or**

Decrease dose from 25 mg daily to 25 mg every other day **or**

Decrease dose from 25 mg every other day to withhold medication

≥6.0 mEq/L: Withhold medication until potassium <5.5 mEq/L, then restart at 25 mg every other day

Dosing: ElderlyRefer to adult dosing. Also see Geriatric Considerations.

Dosing: Renal Impairment

Hypertension: Cl_{cr} <50 mL/minute or serum creatinine >2.0 mg/dL in males or >1.8 mg/dL in females: Use is contraindicated; risk of hyperkalemia increases with declining renal function

All other indications: Cl_{cr} ≤30 mL/minute: Use is contraindicated.

Dosing: Hepatic ImpairmentNo dosage adjustment needed for mild-to-moderate impairment. Safety and efficacy not established for severe impairment.

Calculations

- Creatinine Clearance: Adults

Administration: OralMay be administered with or without food.

Dietary ConsiderationsMay be taken with or without food. Do not use salt substitutes containing potassium.

StorageStore at controlled room temperature of 25°C (77°F).

ContraindicationsSerum potassium >5.5 mEq/L at initiation; Cl_{cr} ≤30 mL/minute; concomitant use of strong CYP3A4 inhibitors (see Drug Interactions for details)

The following additional contraindications apply to patients with hypertension: Type 2 diabetes mellitus (noninsulin dependent, NIDDM) with microalbuminuria; serum creatinine >2.0 mg/dL in males or >1.8 mg/dL in females; Cl_{cr} <50 mL/minute; concomitant use with potassium supplements or potassium-sparing diuretics

Warnings/Precautions

Concerns related to adverse effects:

- Hyperkalemia: Monitor closely for hyperkalemia; increases in serum potassium were dose related during clinical trials and rates of hyperkalemia also increased with declining renal function.

Disease-related concerns:

- Diabetes: Use with caution in heart failure patients post-MI with diabetes (especially if patient has proteinuria); risk of hyperkalemia is increased.

- Hepatic impairment: Use with caution in patients with severe hepatic impairment; safety and efficacy have not been established.

- Renal impairment: Risk of hyperkalemia is increased with declining renal function. Use with caution in patients with mild renal impairment; contraindicated with moderate-severe impairment (HTN: Cl_{cr} <50 mL/minute; other indications: Cl_{cr} ≤30 mL/minute).

Concurrent drug therapy issues:

- High potential for interactions: Dosage adjustment needed for patients on moderate CYP3A4 inhibitors.

Geriatric ConsiderationsSince this medication is contraindicated in patients with a Cl_{cr} <50 mL/minute, it will have limited use in the elderly. Due to physiologic changes, elderly may be at increased risk of hyperkalemia when using this medication.

Pregnancy Risk FactorB

Pregnancy ConsiderationsNo teratogenic effects were seen in animal studies, however, there are no adequate and well-controlled studies in pregnant women. Use during pregnancy only if the potential benefit to the mother outweighs the possible risk to the fetus.

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions

>10%: Endocrine & metabolic: Hyperkalemia ([HF post-MI: K >5.5 mEq/L: 16%; K ≥6 mEq/L: 6%] [HTN: K >5.5 mEq/L at doses ≤100 mg: ≤1%; doses >100 mg: 9%]), hypertriglyceridemia (1% to 15%, dose related)

1% to 10%:

Central nervous system: Dizziness (3%), fatigue (2%)

Endocrine & metabolic: Hyponatremia (2%, dose related), breast pain (males <1% to 1%), gynecomastia (males <1% to 1%), hypercholesterolemia (<1% to 1%)

Gastrointestinal: Diarrhea (2%), abdominal pain (1%)

Genitourinary: Abnormal vaginal bleeding (<1% to 2%)

Renal: Creatinine increased (HF post-MI: 6%), albuminuria (1%)

Respiratory: Cough (2%)

Miscellaneous: Flu-like syndrome (2%)

<1%, postmarketing, and/or case reports: Angioneurotic edema, BUN increased, liver function tests increased, rash, uric acid increased

Metabolism/Transport Effects**Substrate** of CYP3A4 (major)

Drug Interactions

ACE Inhibitors: Eplerenone may enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Angiotensin II Receptor Blockers: Eplerenone may enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Eplerenone. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Eplerenone. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May increase the serum concentration of Eplerenone. Management: A lower starting dose of eplerenone (25 mg once daily) is recommended in patients with hypertension who are also taking drugs that are moderate inhibitors of CYP3A4. *Risk D: Consider therapy modification*

CYP3A4 Inhibitors (Strong): May increase the serum concentration of Eplerenone. *Risk X: Avoid combination*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Eplerenone. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Eplerenone. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of Eplerenone. *Risk C: Monitor therapy*

Potassium Salts: Eplerenone may enhance the hyperkalemic effect of Potassium Salts. Management: This combination is contraindicated in patients receiving eplerenone for treatment of hypertension. *Risk D: Consider therapy modification*

Potassium-Sparing Diuretics: Eplerenone may enhance the hyperkalemic effect of Potassium-Sparing Diuretics. Management: This combination is contraindicated in patients receiving eplerenone for treatment of hypertension. *Risk D: Consider therapy modification*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the metabolism of Eplerenone. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Food: Grapefruit juice increases eplerenone AUC ~25%.

Herb/Nutraceutical: St John's wort may decrease levels of eplerenone. Avoid black cohosh, California poppy, coleus, golden seal, hawthorn, mistletoe, periwinkle, quinine, shepherd's purse(may have increased antihypertensive effect). Avoid bayberry, blue cohosh, cayenne, ephedra, ginger, ginseng (American), kola, licorice (may diminish the antihypertensive effect).

Monitoring ParametersBlood pressure; serum potassium (levels monitored prior to therapy, within the first week, and at 1 month after start of treatment or dose adjustment, then periodically [monthly in clinical trials]); renal function

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents or herbal products patient may be taking; (eg, increased risk of toxicity). Assess results of laboratory tests prior to and periodically during therapy (potassium levels, renal function), therapeutic effectiveness (blood pressure), and adverse response at beginning of and at regular intervals during therapy (eg, hypotension, hyperkalemia). Teach patient proper use, possible side effects/appropriate interventions, and adverse reactions to report.

Monitoring: Lab TestsSerum potassium (levels monitored prior to therapy, within the first week, and at 1 month after start of treatment or dose adjustment, then periodically [monthly in clinical trials]); renal function

Patient EducationDo not take any new medication during therapy without consulting prescriber. Take exactly as directed at the same time of day, without regard for meals. Do not alter dose or discontinue without consulting prescriber; it may take up to 4 weeks to achieve desired results. Do not use potassium supplement or salt substitutes without consulting prescriber. This drug does not eliminate need for diet or exercise regimen as recommended by prescriber. May cause dizziness, fainting, lightheadedness (use caution when driving or engaging in tasks that require alertness until response to drug is known); postural hypotension (use caution when rising from lying or sitting position or climbing stairs); diarrhea (boiled milk, buttermilk, or yogurt may help); breast pain (males); abnormal vaginal bleeding. Report chest pain, palpitations; unusual cough or flu-like symptoms; or other persistent or severe adverse effects. **Breast-feeding precaution:** Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 25 mg, 50 mg

Inspra™: 25 mg, 50 mg

Generic AvailableYes

ManufacturerPfizer

Pricing: U.S. (www.drugstore.com)

Tablets (Inspra)

25 mg (30): $122.00

50 mg (30): $121.79

Mechanism of ActionAldosterone, a mineralocorticoid, increases blood pressure primarily by inducing sodium and water retention. Overexpression of aldosterone is thought to contribute to myocardial fibrosis (especially following myocardial infarction) and vascular fibrosis. Mineralocorticoid receptors are located in the kidney, heart, blood vessels, and brain. Eplerenone selectively blocks mineralocorticoid receptors reducing blood pressure in a dose-dependent manner and appears to prevent myocardial and vascular fibrosis.

Pharmacodynamics/Kinetics

Distribution: V_d: 43-90 L

Protein binding: ~50%; primarily to $alpha_1$-acid glycoproteins

Metabolism: Primarily hepatic via CYP3A4; metabolites inactive

Bioavailability: 69%

Half-life elimination: 4-6 hours

Time to peak, plasma: ~1.5 hours; may take up to 4 weeks for full antihypertensive effect

Excretion: Urine (~67%); feces (32%); <5% as unchanged drug in urine and feces

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentHypertriglyceridemia is common; monitor when used with clozapine, olanzapine, quetiapine, and mirtazapine. Lithium levels should be monitored for possible effects on serum concentrations. Fluoxetine, fluvoxamine, and nefazodone may increase levels of eplerenone; initial dose should be 25 mg/day.

Cardiovascular Considerations

Heart Failure: The ACC/AHA 2005 Heart Failure Guidelines suggest that the addition of an aldosterone antagonist is reasonable in selected patients with moderately severe to severe symptoms of heart failure (HF) and reduced LVEF who can be carefully monitored (renal function and serum potassium). When evaluating a heart failure patient for aldosterone antagonist treatment, creatinine should be ≤2.5 mg/dL in men or ≤2 mg/dL in women and potassium <5 mEq/L. Patients are not candidates for such therapy if they are unable to comply with the monitoring required. In addition, the routine combined use of an ACE inhibitor, ARB, and aldosterone antagonist is not recommended in patients with current or prior symptoms of HF and reduced LVEF. In severe heart failure, spironolactone (25 mg/day), when combined with maximal standard therapy, resulted in a striking improvement in cardiovascular outcome (Pitt B, 1999). In the RALES trial, potassium supplementation was stopped with the initiation of spironolactone unless the patient was hypokalemic. The aldosterone antagonist, eplerenone, was recently studied in patients with acute MI complicated by left ventricular dysfunction and heart failure (Pitt B, 2003). Patients were randomly assigned to eplerenone (initially 25 mg daily; titrated to 50 mg daily) or placebo, in addition to standard therapy. During a mean follow-up of 16 months, 478 deaths in the eplerenone group occurred and 554 deaths in the placebo group (CI 0.75-0.96; p = 0.008). The addition of eplerenone to optimal medical therapy reduces morbidity and mortality in this patient population.

Monitoring Issues: The ACC/AHA 2005 Heart Failure Guidelines emphasize factors to consider in minimizing the risk of hyperkalemia with use of aldosterone antagonists such as initial dosages to use, avoidance of NSAIDs, discontinuing or reducing potassium supplements, and following monitoring guidelines. They suggest that potassium levels and renal function be checked in 3 days and at 1 week after initiation of therapy and at least monthly for the first 3 months. If serum potassium increases to a level >5.4 mEq/L while on an aldosterone antagonist, dose reduction is suggested.

Hypertension: Aldosterone antagonists may add additional antihypertensive benefits in patients who have severe LV dysfunction (NYHA class III and IV), but only after ACE inhibitors and beta-blockers have been instituted (if no contraindications or intolerances exist).

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Special Alerts

Epoetin: Ongoing Safety Review - Updated September 26, 2008

Erythropoietin (Epogen®/Procrit®) and Darbepoetin (Aranesp®): Labeling Updates, Including Boxed Warning Revisions Regarding Use in Patients With Cancer - Updated September 2008

The U.S. Food and Drug Administration (FDA), Amgen Inc, and Ortho Biotech have issued a “Dear Health Care Professional” letter alerting practitioners of revised labeling for erythropoiesis-stimulating agents (ESAs) (epoetin alfa [Epogen®, Procrit®] and darbepoetin alfa [Aranesp®]). The labeling for these products has been updated, including changes to the indications, boxed warnings, and dosing reflecting that ESAs are not indicated for patients receiving myelosuppressive therapy when the anticipated outcome is curative and ESA therapy should not be initiated if the hemoglobin level is ≥10 g/dL. Medication guides have been developed to communicate the risks and benefits of ESAs for patients.

Prompted by information from studies on ESA use, over the last year there have been alerts, new labeling and/or “Dear Health Care Professional” letters issued regarding ESA use in both patients with cancer and patients with chronic renal failure. The studies in patients with cancer provided evidence of shortened time to tumor progression and increased mortality (decreased overall survival) in cancer patients (breast, cervical, head and neck, lymphoid, and nonsmall cell lung cancer) who received ESAs; however, in some studies, the ESA doses were targeted to maintain hemoglobin levels ≥12 g/dL. Based on this risk, as well as the risk of serious cardio- and thrombovascular events, labeling revisions have included recommendations from FDA advisory committees on appropriate ESA use in cancer and chronic renal failure patients and have consisted of expanded and/or strengthened boxed warnings, safety information, and revised dosing information. Practitioners are reminded that ESA use is only appropriate in the treatment of anemia in cancer patients due to concomitant chemotherapy, and therapy should be discontinued following completion of chemotherapy.

Boxed warning changes concerning use in chronic renal failure patients have included data from two studies showing an increased risk of death and serious cardiovascular events when ESAs were administered to achieve higher target hemoglobin compared with lower hemoglobin levels (13.5 vs 11.3 g/dL and 14 vs 10 g/dL). Dosing recommendations for chronic renal failure now specify a target hemoglobin range of 10-12 g/dL to achieve and maintain, including guidelines for increasing doses in patients not achieving recommended target hemoglobin range. Additional recommendations have been created for those patients unable to achieve the target hemoglobin range (despite appropriate titrations) with precautions against continuing to increase the dose and a consideration of ESA discontinuation.

The FDA is also aware of preliminary findings from a German trial of epoetin (at doses higher than recommended for anemia) to treat acute ischemic stroke. Although analysis is ongoing, preliminary findings show increased mortality in the epoetin group, when compared to the placebo group.

The FDA Medwatch alerts and a link to the most recent “Dear Healthcare Professional” letter can be found at

Medication Safety Issues

Sound-alike/look-alike issues:

Epoetin alfa may be confused with darbepoetin alfa, epoetin beta

Epogen® may be confused with Neupogen®

International issues:

Epopen® [Spain] may be confused with EpiPen® which is a brand name for epinephrine in the U.S.

Pronunciation(e POE e tin AL fa)

U.S. Brand NamesEpogen®; Procrit®

Canadian Brand NamesEprex®

Pharmacologic CategoryColony Stimulating Factor

Use: Labeled IndicationsTreatment of anemia (elevate/maintain red blood cell level and decrease the need for transfusions) associated with HIV (zidovudine) therapy, chronic renal failure (including patients on dialysis and not on dialysis); reduction of allogeneic blood transfusion for elective, noncardiac, nonvascular surgery; treatment of anemia due to concurrent chemotherapy in patients with metastatic cancer (nonmyeloid malignancies)

Note: Erythropoietin is **not** indicated for use in cancer patients under the following conditions:

- receiving hormonal therapy, therapeutic biologic products, or radiation therapy unless also receiving concurrent myelosuppressive chemotherapy
- receiving myelosuppressive therapy when the expected outcome is curative
- anemia due to other factors (eg, iron deficiency, folate deficiency or gastrointestinal bleed)

Use: Unlabeled/InvestigationalTreatment of anemia associated with critical illness; anemia of prematurity; symptomatic anemia in myelodysplastic syndrome (MDS)

Dosing: AdultsIndividuals with anemia due to iron deficiency, sickle cell disease, autoimmune hemolytic anemia, and bleeding, generally have appropriate endogenous EPO levels to drive erythropoiesis and would not ordinarily be candidates for EPO therapy. **Note:** Hemoglobin levels should not exceed 12 g/dL and should not rise >1 g/dL per 2-week time period during therapy in any patient.

Chronic renal failure patients: SubQ, I.V. (preferred for hemodialysis patients): Initial dose: 50-100 units/kg 3 times/week. Individualize dosing to achieve and maintain hemoglobin levels between 10-12 g/dL. Hemoglobin levels should not exceed a target range of 10-12 g/dL.

Dosage adjustment:

Decrease dose by 25%: If hemoglobin approaches 12 g/dL **or** hemoglobin increases >1 g/dL in any 2-week period. If hemoglobin continues to increase, temporarily discontinue therapy until hemoglobin begins to decrease, then resume therapy with a ~25% reduction from previous dose.

Increase dose by 25%: If hemoglobin <10 g/dL and does not increase by 1 g/dL after 4 weeks of therapy (with adequate iron stores) **or** hemoglobin decreases below 10 g/dL. If transferrin saturation >20%, may increase epoetin dose. Do not increase dose more frequently than at 4-week intervals, unless clinically indicated (hemoglobin response time for dose increases may be 2-6 weeks).

Inadequate or lack of response: If patient does not attain target hemoglobin range of 10-12 g/dL after appropriate dose titrations over 12 weeks:

Do not continue to increase dose and use the minimum effective dose that will maintain a hemoglobin level sufficient to avoid red blood cell transfusions **and** evaluate patient for other causes of anemia.

Monitor hemoglobin closely thereafter, and if responsiveness improves, may resume making dosage adjustments as recommended above. If responsiveness does not improve and recurrent red blood cell transfusions continue to be needed, discontinue therapy.

Maintenance dose: Individualize to target hemoglobin range of 10-12 g/dL; limit additional dosage increases to every 4 weeks (or longer)

Dialysis patients: Median dose: 75 units/kg 3 times/week

Nondialysis patients: Dosing range: 75-150 units/kg/week

Zidovudine-treated, HIV-infected patients (with serum erythropoietin levels ≤500 and zidovudine doses ≤4200 mg/week; patient with erythropoietin levels >500 mU/mL is unlikely to respond). Titrate dosage to use the minimum effective dose that will maintain a hemoglobin level sufficient to avoid red blood cell transfusions. Hemoglobin levels should not exceed 12 g/dL

I.V.: 100 units/kg 3 times/week for 8 weeks

Dosage adjustment:

Increase dose by 50-100 units/kg 3 times/week: If response is not satisfactory in terms of reducing transfusion requirements or increasing hemoglobin after 8 weeks of therapy. Evaluate response every 4-8 weeks thereafter and adjust the dose accordingly by 50-100 units/kg increments 3 times/week. If patient has not responded satisfactorily to 300 unit/kg dose 3 times/week, a response to higher doses is unlikely.

Withhold dose: If hemoglobin exceeds 12 g/dL and resume treatment at a 25% dose reduction when hemoglobin drops below 11g/dL.

Cancer patient on chemotherapy: Treatment of patients with erythropoietin levels >200 mU/mL is **not recommended by the manufacturer.** Titrate dosage to use the minimum effective dose that will maintain a hemoglobin level sufficient to avoid red blood cell transfusions. Do not initiate therapy if hemoglobin ≥10 g/dL. Discontinue erythropoietin following completion of chemotherapy.

SubQ: Initial dose: 150 units/kg 3 times/week or 40,000 units once weekly; commonly used doses range from 10,000 units 3 times/week to 40,000-60,000 units once weekly.

Dosage adjustment:

Increase dose: If response is not satisfactory after a sufficient period of evaluation (no reduction in transfusion requirements or increase in hemoglobin after 8 weeks of 3 times/week therapy) **or** (no increase in hemoglobin by ≥1 g/dL after 4 weeks of once-weekly therapy), the dose may be increased every 4 weeks (or longer) to 300 units/kg 3 times/week, **or** when dosed weekly, increased all at once to 60,000 units weekly. If patient does not respond, a response to higher doses is unlikely.

Withhold dose: If hemoglobin exceeds a level needed to avoid red blood cell transfusion. Resume treatment with a 25% dose reduction when hemoglobin approaches a level where transfusions may be required.

Reduce dose by 25%: If hemoglobin increases >1 g/dL in any 2-week period **or** hemoglobin reaches a level sufficient to avoid red blood cell transfusion.

Discontinue: If after 8 weeks of therapy there is no response (ie, increased hemoglobin levels) or transfusions still required.

Surgery patients: Prior to initiating treatment, obtain a hemoglobin to establish that it is >10 g/dL and ≤13 g/dL: SubQ: Initial dose: 300 units/kg/day for 10 days before surgery, on the day of surgery, and for 4 days after surgery

Alternative dose: 600 units/kg in once weekly doses (21, 14, and 7 days before surgery) plus a fourth dose on the day of surgery

Anemia of critical illness (unlabeled use): SubQ: 40,000 units once weekly

Symptomatic anemia associated with MDS (unlabeled use): SubQ: 40,000-60,000 units 1-3 times/ week

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** Hemoglobin levels should not exceed 12 g/dL and should not rise >1 g/dL per 2-week time period during therapy in any patient.

Anemia of prematurity (unlabeled use): Infants: SubQ, I.V.: Dosing range: 500-1250 units/kg/week; commonly used dose: 250 units/kg 3 times/week; supplement with oral iron therapy 3-8 mg/kg/day

Chronic renal failure patients: SubQ, I.V. (preferred for hemodialysis patients): Initial dose: 50 units/kg 3 times/week. Individualize dosing to achieve and maintain hemoglobin levels between 10-12 g/dL. Hemoglobin levels should not exceed 12 g/dL.

Dosage adjustment:

Decrease dose by 25%: If hemoglobin approaches 12 g/dL **or** hemoglobin increases >1 g/dL in any 2-week period. If hemoglobin continues to increase, temporarily discontinue therapy until hemoglobin begins to decrease, then resume therapy with a ~25% reduction from previous dose.

Increase dose by 25%: If hemoglobin <10 g/dL and does not increase by 1 g/dL after 4 weeks of therapy (with adequate iron stores) **or** hemoglobin decreases below 10 g/dL. If transferrin saturation >20%, may increase epoetin dose. Do not increase dose more frequently than at 4-week intervals, unless clinically indicated (hemoglobin response time for dose increases may be 2-6 weeks).

Inadequate or lack of response: If patient does not attain target hemoglobin range of 10-12 g/dL after appropriate dose titrations over 12 weeks:

Do not continue to increase dose and use the minimum effective dose that will maintain a hemoglobin level sufficient to avoid red blood cell transfusions **and** evaluate patient for other causes of anemia.

Monitor hemoglobin closely thereafter, and if responsiveness improves, may resume making dosage adjustments as recommended above. If responsiveness does not improve and recurrent red blood cell transfusions continue to be needed, discontinue therapy.

Maintenance dose: Individualize to target hemoglobin range of 10-12 g/dL; limit additional dosage increases to every 4 weeks (or longer)

Dialysis patients: 167 units/kg/week (hemodialysis) **or** 76 units/kg/week (peritoneal dialysis), in 2-3 divided doses per week

Nondialysis patients: Dosing range: 50-250 units/kg 1-3 times/week

Zidovudine-treated, HIV-infected patients (patient with erythropoietin levels >500 mU/mL is unlikely to respond): SubQ, I.V.: Limited data available; reported dosing range: 50-400 units/kg 2-3 times/week.

Note: Titrate dosage to use the minimum effective dose that will maintain a hemoglobin level sufficient to avoid red blood cell transfusions. Hemoglobin levels should not exceed 12 g/dL.

Cancer patients on chemotherapy: I.V.: 600 units/kg once weekly (maximum: 40,000 units). Treatment of patients with erythropoietin levels >200 mU/mL is **not recommended by the manufacturer.** Titrate dosage to use the minimum effective dose that will maintain a hemoglobin level sufficient to avoid red blood cell transfusions. Do not initiate therapy if hemoglobin ≥10 g/dL. Discontinue erythropoietin following completion of chemotherapy.

Dosage adjustment:

Increase dose: If response is not satisfactory after a sufficient period of evaluation (no increase in hemoglobin by ≥1 g/dL after 4 weeks of once-weekly therapy), the dose may be increased every 4 weeks (or longer) to 900 units/kg/week; maximum 60,000 units. If patient does not respond, a response to higher doses is unlikely.

Withhold dose: If hemoglobin exceeds a level needed to avoid red blood cell transfusion. Resume treatment with a 25% dose reduction when hemoglobin approaches a level where transfusions may be required.

Reduce dose by 25%: If hemoglobin increases >1 g/dL in any 2-week period **or** hemoglobin reaches a level sufficient to avoid red blood cell transfusion.

Discontinue: If after 8 weeks of therapy there is no response (ie, increased hemoglobin levels) or transfusions still required.

Dosing: Renal ImpairmentThe National Kidney Foundation Clinical Practice Guideline for Anemia in Chronic Kidney Disease: 2007 Update of Hemoglobin Target (September, 2007) recommend hemoglobin levels in the range of 11-12 g/dL for dialysis and nondialysis patients receiving ESAs; hemoglobin levels should not be >13 g/dL.

Hemodialysis: Supplemental dose is not necessary. I.V. route is preferred for hemodialysis patients.

Peritoneal dialysis: Supplemental dose is not necessary.

Calculations

- EPO to Aranesp

Administration: I.V.

Patients with CRF on dialysis: I.V. route preferred; may be administered I.V. bolus into the venous line after dialysis.

Patients with CRF not on dialysis: May be administered I.V. or SubQ

Administration: I.V. DetailpH: 6.6-7.2 (single dose vial); 5.8-6.4 (multidose vial)
Administration: OtherSubQ:

Patients with CRF on dialysis: I.V. route preferred.

Patients with CRF not on dialysis: May be administered I.V. or SubQ

StorageVials should be stored at 2°C to 8°C (36°F to 46°F); **do not freeze or shake**. Protect from light.

Single-dose 1 mL vial contains no preservative: Use one dose per vial. Do not re-enter vial; discard unused portions.

> Single-dose vials (except 40,000 units/mL vial) are stable for 2 weeks at room temperature. Single-dose 40,000 units/mL vial is stable for 1 week at room temperature.

Multidose 1 mL or 2 mL vial contains preservative. Store at 2°C to 8°C after initial entry and between doses. Discard 21 days after initial entry.

> Multidose vials (with preservative) are stable for 1 week at room temperature.
>
> Prefilled syringes containing the 20,000 units/mL formulation with preservative are stable for 6 weeks refrigerated (2°C to 8°C).
>
> Dilutions of 1:10 in $D_{10}W$ with human albumin 0.05% or 0.1% are stable for 24 hours.

ReconstitutionPrior to SubQ administration, preservative free solutions may be mixed with bacteriostatic NS containing benzyl alcohol 0.9% in a 1:1 ratio.
CompatibilityStable in $D_{10}W$ with albumin 0.05%, $D_{10}W$ with albumin 0.1%; **incompatible** with $D_{10}W$ with albumin 0.01%, $D_{10}W$, NS; **variable stability (consult detailed reference)** in TPN.
RestrictionsAn FDA-approved medication guide is available; distribute to each patient to whom this medication is dispensed.
ContraindicationsHypersensitivity to albumin (human) or mammalian cell-derived products; uncontrolled hypertension
Warnings/Precautions

Boxed warnings:

- Cancer patients: See “Disease-related concerns” below.
- Cardiovascular events/mortality/thromboembolic events: See “Concerns related to adverse effects” below.
- Chronic renal failure patients: See “Disease-related concerns” below.
- Perisurgery patients: See “Disease-related concerns” below.

Concerns related to adverse effects:

- Cardiovascular events/mortality/thromboembolic events: **[U.S. Boxed Warning]: ESAs increased the risk of serious cardiovascular events, thromboembolic events, and mortality** in clinical studies; a rapid rise in hemoglobin (>1 g/dL over 2 weeks) or maintaining higher hemoglobin levels may contribute to these risks. Patients treated with epoetin may require increased heparinization during dialysis to prevent clotting of the artificial kidney.
- Pure red cell aplasia (PRCA): Cases of severe anemia and PRCA have been reported, predominantly in patients with CRF receiving SubQ epoetin (the I.V. route is preferred for hemodialysis patients), Patients with loss of response should be evaluated for pure red cell aplasia with associated neutralizing antibodies to erythropoietin; discontinue treatment in patients with PRCA secondary to neutralizing antibodies to erythropoietin. Antibodies may cross-react; do not switch to another ESA in patients who develop antibody-mediated anemia.

Disease-related concerns:

- Cancer patients: **[U.S. Boxed Warning]: A shortened overall survival and/or increased risk of tumor progression or recurrence has been reported in studies with breast, cervical, head and neck, lymphoid, and nonsmall cell lung cancer patients.** It is of note that in these studies, patients received ESAs to a target hemoglobin of ≥12 g/dL; although risk has not been excluded when dosed to achieve a target hemoglobin of <12 g/dL. **[U.S. Boxed Warnings]: To decrease these risks, and risk of cardio and thrombovascular events, use the lowest dose needed to avoid red blood cell transfusions. Use ESAs in cancer patients only for the treatment of anemia related to concurrent chemotherapy; discontinue ESA following completion of the chemotherapy course. ESAs are not indicated for patients receiving myelosuppressive therapy when the anticipated outcome is curative.**
- Chronic renal failure patients: **[U.S. Boxed Warning]: An increased risk of death and serious cardiovascular events was reported in patients administered ESAs to target higher versus lower hemoglobin levels (13.5 vs 11.3 g/dL; 14 vs 10 g/dL) in two clinical studies; dosing should be individualized to achieve and maintain hemoglobin levels within 10-12 g/dL range.** Hemoglobin rising >1 g/dL in a 2-week period may contribute to the risk. Chronic renal failure patients who exhibit an inadequate hemoglobin response to ESA therapy may be at a

higher risk for cardiovascular events and mortality compared to other patients. ESA therapy may reduce dialysis efficacy (due to increase in red blood cells and decrease in plasma volume); adjustments in dialysis parameters may be needed.

- Hematologic diseases: Safety and efficacy in patients with underlying hematologic diseases have not been established, including hypercoagulation disorders and sickle cell disease.

- Hypertension/cardiovascular disease: Use with caution in patients with a history of hypertension. An excessive rate of rise of hemoglobin is associated with hypertension or exacerbation of hypertension; decrease the epoetin dose if the hemoglobin increase exceeds 1 g/dL in any 2-week period. Blood pressure should be controlled prior to start of therapy and monitored closely throughout treatment. Hypertensive encephalopathy has been reported with patients receiving erythropoietic therapy; monitor closely and control blood pressure.

- Perisurgery patients: **[U.S. Boxed Warning]: Epoetin alfa increased the rate of DVT in patients not receiving anticoagulant prophylaxis; consider DVT prophylaxis in surgery patients.** Increased mortality was also observed in patients undergoing coronary artery bypass surgery who received epoetin alfa; these deaths were associated with thrombotic events. Epoetin is **not** approved for reduction of red blood cell transfusion in patients undergoing cardiac or vascular surgery.

- Porphyria: Use caution with porphyria, exacerbation of porphyria has been reported in patients with chronic renal failure.

- Seizures: Use with caution in patients with a history of seizures. An excessive rate of rise of hemoglobin may be possibly associated with the exacerbation of seizures; decrease the epoetin dose if the hemoglobin increase exceeds 1 g/dL in any 2-week period.

Special populations:

- Pediatrics: Safety and efficacy in children <1 month of age have not been established.

Dosage form specific issues:

- Albumin: Product may contain albumin, which confers a theoretical risk of transmission of viral disease or Creutzfeldt-Jakob disease.

- Benzyl alcohol: Multidose vials contain benzyl alcohol which has been associated with "gasping syndrome" in neonates.

Other warnings/precautions:

- Acute correction: Not recommended for acute correction of severe anemia or as a substitute for transfusion.

- Appropriate use: Hemoglobin levels should not exceed a target range of 10-12 g/dL and should not rise >1 g/dL per 2-week time period during therapy in any patient.

- Factors impairing erythropoiesis: Prior to treatment, correct or exclude deficiencies of iron, vitamin B_{12}, and/or folate, as well as other factors which may impair erythropoiesis (aluminum toxicity, inflammatory conditions, infections). Poor response to therapy should prompt evaluation of potential factors impairing erythropoiesis, as well as possible malignant processes, occult blood loss, hemolysis, and/or bone marrow fibrosis.

- Iron supplementation: Prior to and periodically during therapy, iron stores must be evaluated. Supplemental iron is recommended if serum ferritin <100 mcg/L or serum transferrin saturation <20%.

Geriatric ConsiderationsThere is limited information about the use of epoetin alfa in the elderly. Endogenous erythropoietin secretion has been reported to be decreased in elderly with normocytic or iron deficiency anemias or those with a serum hemoglobin concentration <12 g/dL; one study did not find such a relationship in the elderly with chronic anemia. A blunted erythropoietin response to anemia has been reported in patients with cancer, rheumatoid arthritis, and AIDS.

Pregnancy Risk FactorC

Pregnancy ConsiderationsEpoetin alfa has been shown to have adverse effects (decreased weight gain, delayed development, delayed ossification) in animal studies. Studies suggest that *r*HuEPO-α does not cross the human placenta. Based on case reports, treatment with *r*HuEPO-α may be an option in pregnant women with ESRD on dialysis. Amenorrheic premenopausal women should be cautioned that menstruation may resume following treatment with *r*HuEPO-α and contraception should be considered if pregnancy is to be avoided.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsWhen administered enterally to neonates (mixed with human milk or infant formula), *r*HuEPO-α did not significantly increase serum EPO concentrations. If passage via breast milk does occur, risk to a nursing infant appears low.

Adverse Reactions

>10%:

Cardiovascular: Hypertension (5% to 24%), thrombotic/vascular events (coronary artery bypass graft surgery: 23%), edema (6% to 17%), deep vein thrombosis (3% to 11%)

Central nervous system: Fever (29% to 51%), dizziness (<7% to 21%), insomnia (13% to 21%), headache (10% to 19%)

Dermatologic: Pruritus (14% to 22%), skin pain (4% to 18%), rash (≤16%)

Gastrointestinal: Nausea (11% to 58%), constipation (42% to 53%), vomiting (8% to 29%), diarrhea (9% to 21%), dyspepsia (7% to 11%)

Genitourinary: Urinary tract infection (3% to 12%)

Local: Injection site reaction (<10% to 29%)

Neuromuscular & skeletal: Arthralgia (11%), paresthesia (11%)

Respiratory: Cough (18%), congestion (15%), dyspnea (13% to 14%), upper respiratory infection (11%)

1% to 10%:

Central nervous system: Seizure (1% to 3%)

Local: Clotted vascular access (7%)

<1%, postmarketing, and/or case reports: Allergic reaction, anemia (severe; with or without other cytopenias), CVA, flu-like syndrome, hyperkalemia, hypersensitivity reactions, hypertensive encephalopathy, microvascular thrombosis, MI, myalgia, neutralizing antibodies, pulmonary embolism, pure red cell aplasia (PRCA), renal vein thrombosis, retinal artery thrombosis, tachycardia, temporal vein thrombosis, thrombophlebitis, thrombosis, TIA, urticaria

Oncology: VesicantNo

Oncology: Emetic PotentialVery low (<10%)

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersBlood pressure; hemoglobin, CBC with differential and platelets, transferrin saturation and ferritin, serum chemistry (CRF patients)

Suggested tests to be monitored and their frequency: See table.

Test	Initial Phase Frequency	Maintenance Phase Frequency
Hemoglobin	1-2 x/week	2-4 x/month
Blood pressure	3 x/week	3 x/week
Serum ferritin	Monthly	Quarterly
Transferrin saturation	Monthly	Quarterly
Serum chemistries including CBC with differential, creatinine, blood urea nitrogen, potassium, phosphorous	Regularly per routine	Regularly per routine

Reference Range

Zidovudine-treated HIV patients: Available evidence indicates patients with endogenous serum erythropoietin levels >500 mU/mL are unlikely to respond

Cancer chemotherapy patients: Measurement of endogenous serum erythropoietin levels in patients with cancer is generally not recommended (NCCN Cancer- and Chemotherapy-Induced Anemia Guidelines, v2.2009). Treatment of patients with endogenous serum erythropoietin levels >200 mU/mL is not recommended according to the manufacturer.

Nursing: Physical Assessment/MonitoringEvaluate history of hypertension or seizures and potential risk for thromboembolism prior to beginning therapy. Blood pressure should be monitored closely and controlled during therapy. If administered by intravenous infusion, lines should be monitored closely for possible clotting. Assess results of laboratory tests prior to and on a regular scheduled basis during therapy (eg, blood chemistries, hemoglobin/hematocrit, serum ferritin, transferrin saturation); dosage adjustment and iron supplements may be necessary. Evaluate therapeutic effectiveness (according to purpose for use) and adverse response on a frequent basis during therapy (eg, hypertension, thrombotic events, edema, anemia). Teach patient proper use if self-administered (appropriate SubQ injection technique and syringe/needle disposal), possible side effects/appropriate interventions (importance of maintaining laboratory schedule), and adverse symptoms to report.

Monitoring: Lab TestsSee table.

Test	Initial Phase Frequency	Maintenance Phase Frequency
Hemoglobin	1-2 x/week	2-4 x/month
Blood pressure	3 x/week	3 x/week
Serum ferritin	Monthly	Quarterly
Transferrin saturation	Monthly	Quarterly
Serum chemistries including CBC with differential, creatinine, blood urea nitrogen, potassium, phosphorous	Regularly per routine	Regularly per routine

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy unless approved by prescriber. If self-administered, follow exact directions for injection and needle disposal. You will require frequent blood tests to determine appropriate dosage and reduce potential for severe adverse effects; maintaining laboratory testing schedule is vital. Do not make significant changes in your dietary iron without consulting prescriber. You may experience fever; headache; trouble sleeping; itching; skin pain; nausea; and/or vomiting, diarrhea, heartburn, and upper respiratory congestion. Contact prescriber if symptoms persist. Report signs or symptoms of edema (eg, swollen extremities, respiratory difficulty, rapid weight gain); onset of severe headache, unusual dizziness, or blurred vision; chest pain; leg pain and tenderness; muscular tremors or seizure activity; difficulty breathing, coughing, or congestion; or other adverse effects.
Pregnancy/breast-feeding precautions: Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]:

Epogen®, Procrit®: 2000 units/mL (1 mL); 3000 units/mL (1 mL); 4000 units/mL (1 mL); 10,000 units/mL (1 mL); 40,000 units/mL (1 mL) [contains human albumin]

Injection, solution [with preservative]:

Epogen®, Procrit®: 10,000 units/mL (2 mL); 20,000 units/mL (1 mL) [contains human albumin and benzyl alcohol]

Generic AvailableNo

ManufacturerAmgen Inc

Pricing: U.S. (www.drugstore.com)

Solution (Epogen)

2000 units/mL (1): $36.71

3000 units/mL (1): $47.99

4000 units/mL (1): $53.50

10000 units/mL (2): $272.93

10000 units/mL (10): $1290.27

20000 units/mL (10): $2572.89

3000 units/mL (6): $274.48

4000 units/mL (6): $363.90

10000 units/mL (6): $855.99

10000 units/mL (12): $1810.41

20000 units/mL (6): $1804.21

40000 units/mL (4): $2394.33

Mechanism of ActionInduces erythropoiesis by stimulating the division and differentiation of committed erythroid progenitor cells; induces the release of reticulocytes from the bone marrow into the bloodstream, where they mature to erythrocytes. There is a dose response relationship with this effect. This results in an increase in reticulocyte counts followed by a rise in hematocrit and hemoglobin levels.

Pharmacodynamics/Kinetics

Onset of action: Several days

Peak effect: 2-3 weeks

Distribution: V_d: 9 L; rapid in the plasma compartment; concentrated in liver, kidneys, and bone marrow

Metabolism: Some degradation does occur

Bioavailability: SubQ: ~21% to 31%; intraperitoneal epoetin: 3% (a few patients)

Half-life elimination: Cancer: SubQ: 16-67 hours; Chronic renal failure: I.V.: 4-13 hours

Time to peak, serum: Chronic renal failure: SubQ: 5-24 hours

Excretion: Feces (majority); urine (small amounts, 10% unchanged in normal volunteers)

Pharmacotherapy Pearls

Factors limiting response to epoetin alfa: Delayed onset of erythropoiesis (2-6 weeks to increase hemoglobin), iron deficiency (most patients require iron supplementation); underlying infection, inflammatory or malignant process; blood loss (occult), underlying hematologic disease (thalassemia, refractory anemia, MDS); vitamin deficiency (folic acid or cyanocobalamin), hemolysis, aluminum overload, osteitis fibrosa cystica, and PRCA

Oncology Comment: The American Society of Hematology (ASH) and American Society of Clinical Oncology (ASCO) 2007 updates to the clinical practice guidelines for the use of erythropoiesis-stimulating agents (ESAs) indicate that ESAs are most appropriate when used according to the dosage parameters within the Food and Drug Administration (FDA) approved labeling for epoetin and darbepoetin (Rizzo, 2008). While the previous guidelines addressed only the use of epoetin, the 2007 guidelines also address the use of darbepoetin, which is assessed as being equivalent to epoetin with respect to safety and efficacy. When used as an option for the treatment of chemotherapy-associated anemia (to increase hemoglobin and decrease red blood cell transfusions), therapy with ESAs should begin as the hemoglobin level approaches or falls below 10 g/dL. The ASH/ASCO guidelines recommend following the FDA approved dosing (and dosing adjustment) guidelines and target hemoglobin ranges as alternate dosing and schedules have not demonstrated consistent differences in effectiveness with regard to hemoglobin response. In patients who do not have a response within 6-8 weeks (hemoglobin rise <1-2 g/dL or no reduction in transfusions) ESA therapy should be discontinued.

The guidelines note that patients with an increased risk of thromboembolism (generally includes previous history of thrombosis, surgery, and/or prolonged periods of immobilization) and patients receiving concomitant medications that may increase thromboembolic risk, should begin ESA therapy only after careful consideration. With the exception of low-risk myelodysplasia-associated anemia (which has evidence supporting the use of ESAs without concurrent chemotherapy), the guidelines do not support the use of ESAs in the absence of concurrent chemotherapy.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusSedation is common; may cause dizziness

Mental Health: Effects on Psychiatric TreatmentNone reported

Cardiovascular ConsiderationsThe ACC/AHA 2005 Heart Failure Guidelines suggest that the benefit of enhancing erythropoiesis in these patients is not established. Although some small studies have shown a benefit from erythropoietin and iron in mild anemia in heart failure, further investigation is required evaluating the risks and benefits.

Anesthesia and Critical Care Concerns/Other Considerations**Routine Use in Critically-Ill Patients**

A prospective, randomized, double-blind, placebo-controlled, multicenter trial was performed with critically-ill patients assessing the efficacy of recombinant human erythropoietin in reducing red blood cell transfusions (Corwin, 2002). Patients were enrolled from December,1998 through June, 2001. Over 1300 ICU (medical, surgical, or medical/surgical) patients were randomized to receive placebo or 40,000 units of erythropoietin subcutaneously on ICU day 3 and then weekly for a total of 3 doses for patients who remained in the hospital. Inclusion criteria included ICU stay for 3 days, age >18 years, and hematocrit <38%. Exclusion criteria were extensive and included acute ischemic heart disease, acute gastrointestinal bleed, and renal failure with hemodialysis. Each patient's physician determined the need for red blood cell transfusion. Results: The mean baseline hemoglobin was 9.97 g/dL in each group. Patients receiving erythropoietin were less likely to receive transfusions. The median number of units transfused per patient in the placebo group was 2 and in the erythropoietin group was 1 (p<0.001). The erythropoietin group had a 9.9% absolute reduction in RBC transfusions during 28 days (p<0.001, OR 0.67, CI 0.54-0.83). Mortality and adverse clinical events were not significantly different between groups. The authors concluded that weekly administration of erythropoietin in critically-ill patients reduces red blood cell transfusions and increases hemoglobin. The authors also suggest that further study is needed to determine if use of erythropoietin results in improved clinical outcomes.

A restrictive transfusion trial was published after the above Corwin trial was underway (Hebert, 1999). Hebert and his group evaluated a restrictive transfusion strategy (transfuse if hemoglobin <7 g/dL to maintain between 7 and 9 g/dL) versus a liberal strategy (transfuse if hemoglobin <10 g/dL to maintain between 10 and 12 g/dL). Inclusion criteria included anticipated ICU stay >24 hours, hemoglobin ≤9 g/dL with 72 hours of ICU admission, and euvolemia after initial treatment. Exclusion criteria included chronic anemia, active bleeding, or admission after a routine cardiac surgical procedure. The restrictive approach to transfusion was at least as effective as and possibly superior to a liberal transfusion policy in critically-ill patients. The exception to this may be patients with acute myocardial infarction and unstable angina.

More recently, Corwin, et al (2007) once again evaluated the use of recombinant human erythropoietin in the critically ill. In this prospective, randomized, placebo-controlled trial, 1460 medical, surgical, or trauma patients were enrolled between December, 2003 and June, 2006. Patients received either subcutaneous erythropoietin 40,000 units or placebo once weekly for a maximum of 3 doses and were followed for 140 days. The primary endpoint of the study was the percentage of patients who received a red cell transfusion between days 1 and 29. Secondary endpoints included the number of red cell units transfused between days 1 and 29, mortality at day 29 and day 140, and the change in hemoglobin concentration from baseline to day 29. Patients were evaluated for inclusion into the study if they remained in that ICU for 2 days. Inclusion criteria were age >18 years and hemoglobin concentration <12 g/dL. Exclusion criteria were extensive and included acute ischemic heart disease during the ICU stay, acute gastrointestinal bleed, hemodialysis, and patients at risk for thrombosis (history of pulmonary embolism, deep venous thrombosis, ischemic stroke, other arterial or venous thrombosis). Red cell transfusions targeted hemoglobin concentrations between 7 and 9 g/dL, but the need for transfusion was determined by the treating physician (this is more consistent with clinical practice after the Hebert trial was published and different than the previous Corwin trial). Results: The mean baseline hemoglobin for each group was 9.6 g/dL. The use of erythropoietin did not significantly decrease the need for red cell transfusion (46.0% in the erythropoietin group transfused vs 48.3% in the placebo group, p=0.34). The hemoglobin concentration at day 29 increased more in the erythropoietin group compared to placebo (1.6 ± 2.0 g/dL vs 1.2 ± 1.8 g/dL, p<0.001); however, by day 42 the hemoglobin concentrations in both groups were similar. Mortality at day 29 was significantly lower in the group receiving erythropoietin (8.5% vs 11.4%, p=0.02) from the Kaplan-Meier estimate, but no difference was seen in the Cox model in the overall population. Only in the trauma subset was mortality at day 29 significantly lower in the erythropoietin group (3.5% vs 6.6%, p=0.04). At day 140, mortality was not significantly lower in the erythropoietin group. Thrombotic events (eg, DVT and myocardial infarction) were significantly higher in the erythropoietin group as compared to placebo and appeared to be dose-related (16.5% vs 11.5%, p=0.008, HR 1.41, CI 1.06-1.86). However, upon further analysis those patients who did not receive heparin at baseline developed these events more frequently. There was no difference in length of stay or the use of mechanical ventilation between groups. The authors concluded that although erythropoietin does not reduce the incidence of red cell transfusion in critically-ill patients, it may reduce mortality in trauma patients. Further investigation is required to define erythropoietin’s role in this population. The routine use of erythropoietin in critically-ill, nontraumatic surgical or medical patients is not supported by this study.

The 2008 Surviving Sepsis Campaign guidelines do not recommend erythropoietin as a treatment for anemia associated with severe sepsis, but suggest that it may be used when septic patients have other therapeutic indications (Grade 1B).

Jump To Field (Select Field Name)

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(e poe PROST en ole)

U.S. Brand NamesFlolan®

Canadian Brand NamesFlolan®

Pharmacologic CategoryProstacyclin; Prostaglandin; Vasodilator

Use: Labeled IndicationsTreatment of idiopathic pulmonary arterial hypertension (IPAH); pulmonary hypertension associated with the scleroderma spectrum of disease (SSD) in NYHA Class III and Class IV patients who do not respond adequately to conventional therapy

Dosing: AdultsIPAH or SSD: I.V.: Initial: 1-2 ng/kg/minute, increase dose in increments of 1-2 ng/kg/minute every 15 minutes or longer until dose-limiting side effects are noted or tolerance limit to epoprostenol is observed. Significant patient variability in optimal dose exists. Maximum dose with chronic therapy has not been defined; however, doses as high as 195 ng/kg/minute have been described in children (Rosenzweig, 1999).

Note: The need for increased doses should be expected with chronic use; incremental increases occur more frequently during the first few months after the drug is initiated.

Dose adjustment:

Increase dose in 1-2 ng/kg/minute increments at intervals of at least 15 minutes if symptoms persist or recur following improvement. In clinical trials, dosing increases occurred at intervals of 24-48 hours.

Decrease dose in 2 ng/kg/minute decrements at intervals of at least 15 minutes in case of dose-limiting pharmacologic events. Avoid abrupt withdrawal or sudden large dose reductions.

Lung transplant: In patients receiving lung transplants, epoprostenol may be tapered after the initiation of cardiopulmonary bypass.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricUnlabeled use; refer to adult dosing.

Administration: I.V.The ambulatory infusion pump should be small and lightweight, be able to adjust infusion rates in 2 ng/kg/minute increments, have occlusion, end of infusion, and low battery alarms, have ± 6% accuracy of the programmed rate, and have positive continuous or pulsatile pressure with intervals ≤3 minutes between pulses. The reservoir should be made of polyvinyl chloride, polypropylene, or glass. The infusion pump used in the most recent clinical trial was CADD-1 HFX 5100 (Pharmacia Deltec). Immediate access to back up pump, infusion sets and medication is essential to prevent treatment interruptions. Assess patient's and family's ability to manage a central venous catheter in the home setting. Clinicians should routinely review with patient the importance of infection control practices for the management of a central venous catheter.

Administration: I.V. DetailWhen given on an ongoing basis, must be infused through a central venous catheter. Peripheral infusion may be used temporarily until central line is established. Infuse using an infusion pump. Avoid abrupt withdrawal (including interruptions in delivery) or sudden large reductions in dosing.

pH: 10.2-10.8

StoragePrior to use, store vials at 15°C to 25°C (59°F to 77°F); do not freeze. Protect from light. Following reconstitution, solution must be stored under refrigeration at 2°C to 8°C (36°F to 46°F) if not used immediately; do not freeze. Protect from light. Discard if refrigerated for >48 hours. During use, a single reservoir of solution may be used at room temperature for a total duration of 8 hours, or used with a cold pouch for administration up to 24 hours. Cold packs should be changed every 12 hours.

Reconstitution Reconstitute only with provided sterile diluent. See table.

Preparation of Epoprostenol Infusion

Note: Only prepare with sterile diluent provided.	
To make 100 mL of solution with concentration:	**Directions**
3000 ng/mL	Dissolve one 0.5 mg vial with 5 mL supplied diluent, withdraw 3 mL, and add to a sufficient volume of supplied diluent to make a total of 100 mL.
5000 ng/mL	Dissolve one 0.5 mg vial with 5 mL supplied diluent, withdraw entire vial contents, and add to a sufficient

	volume of supplied diluent to make a total of 100 mL.
10,000 ng/mL	Dissolve two 0.5 mg vials each with 5 mL supplied diluent, withdraw entire vial contents, and add to a sufficient volume of supplied diluent to make a total of 100 mL.
15,000 ng/mL	Dissolve one 1.5 mg vial with 5 mL supplied diluent, withdraw entire vial contents, and add to a sufficient volume of supplied diluent to make a total of 100 mL.

CompatibilityOnly prepare with sterile diluent provided. Do not mix or administer with any other drugs or solutions prior to or during administration.

RestrictionsOrders for epoprostenol are distributed by two sources in the United States. Information on orders or reimbursement assistance may be obtained from either Accredo Health, Inc (1-800-935-6526) or TheraCom, Inc (1-877-356-5264).

ContraindicationsHypersensitivity to epoprostenol or to structurally-related compounds; chronic use in patients with heart failure due to severe left ventricular systolic dysfunction; patients who develop pulmonary edema during dose initiation

Warnings/Precautions

Concerns related to adverse effects:

- Pulmonary edema: Some patients with primary pulmonary hypertension have developed pulmonary edema during dosing adjustment, which may be associated with pulmonary veno-occlusive disease.
- Rebound pulmonary hypertension: Abrupt interruptions or large sudden reductions in dosage may result in rebound pulmonary hypertension. Avoid abrupt withdrawal.

Disease-related concerns:

- Conditions that increase bleeding risk: Epoprostenol is an inhibitor of platelet aggregation. Use with caution in patients with risk factors for bleeding.

Concurrent drug therapy issues:

- Anticoagulants: During chronic use, unless contraindicated, anticoagulants should be coadministered to reduce the risk of thromboembolism.

Other warnings/precautions:

- Infection: Chronic continuous I.V. infusion of epoprostenol via a chronic indwelling central venous catheter has been associated with local infections and serious blood stream infections.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects were not reported in animal studies. There are no adequate and well-controlled studies in pregnant women. Pregnant women with IPAH are encouraged to avoid pregnancy.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

Note: Adverse events reported during dose initiation and escalation include flushing (58%), headache (49%), nausea/vomiting (32%), hypotension (16%), anxiety/nervousness/agitation (11%), chest pain (11%), dizziness, abdominal pain, bradycardia, musculoskeletal pain, dyspnea, back pain, diaphoresis, dyspepsia, hypoesthesia/paresthesia, and tachycardia are also reported. The following adverse events have been reported during chronic administration for IPAH. Although some may be related to the underlying disease state, anxiety, diarrhea, flu-like syndrome, flushing, headache, jaw pain, nausea, nervousness, and vomiting are clearly contributed to epoprostenol.

>10%:

Cardiovascular: Chest pain (52% to 67%), palpitation (63%), tachycardia (35% to 43%), flushing (23% to 42%), arrhythmia (27%), bradycardia (15%), hypotension (13%)

Central nervous system: Dizziness (83%), headache (46% to 83%), chills/fever/sepsis/flu-like syndrome (13% to 25%), anxiety/nervousness/tremor (7% to 21%), depression/depression psychotic (13%)

Dermatologic: Skin ulcer (39%), eczema/rash/urticaria (25%)

Gastrointestinal: Nausea/vomiting (41% to 67%), anorexia (66%), diarrhea (37% to 50%), weight loss (27%)

Hematologic: Hemorrhage (11% to 19%)

Hepatic: Ascites (23%)

Local: Injection site reactions: Infection (21%), pain (13%)

Neuromuscular & skeletal: Weakness (87% to 100%), pain/neck pain/arthralgia (84%), jaw pain (54% to 75%), arthritis (52%), myalgia (44%), musculoskeletal pain (35%; predominantly involving legs and feet), back pain (13%), hypoesthesia/hyperparesthesia/paresthesia (5% to 12%)

Respiratory: Dyspnea (90%)

Miscellaneous: Diaphoresis (41%)

1% to 10%:

Cardiovascular: Supraventricular tachycardia (8%), cerebrovascular accident (4%), MI (4%)

Central nervous system: Insomnia (9%), seizure (4%), somnolence (4%)

Dermatologic: Rash (10%), pruritus (4%)

Endocrine & metabolic: Hypokalemia (6%), hyperkalemia (4%)

Gastrointestinal: Abdominal pain (14%), constipation (4% to 6%), weight gain (6%), flatulence (5%), abdominal enlargement (4%)

Genitourinary: Urinary tract infection (7%)

Hematologic: Thrombocytopenia (4%)

Ocular: Amblyopia (8%), vision abnormality (4%)

Renal: Hematuria (5%)

Respiratory: Epistaxis (4% to 9%), pleural effusion (4% to 7%), pharyngitis (5%), pneumonia (5%), pneumothorax (4%), pulmonary edema (4%)

<1%, postmarketing, and/or case reports: Anemia, hepatic failure, hypersplenism, hyperthyroidism, pancytopenia, pulmonary embolism, splenomegaly

Drug Interactions

Anticoagulants: Prostacyclin Analogues may enhance the adverse/toxic effect of Anticoagulants. Specifically, the antiplatelet effects of these agents may lead to an increased risk of bleeding with the combination. *Risk C: Monitor therapy*

Antihypertensives: Prostacyclin Analogues may enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Antiplatelet Agents: Prostacyclin Analogues may enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Monitoring ParametersMonitor for improvements in pulmonary function, decreased exertional dyspnea, fatigue, syncope and chest pain, pulmonary vascular resistance, pulmonary arterial pressure and quality of life. In addition, the pump device and catheters should be monitored frequently to avoid “system” related failure. Monitor arterial pressure; assess all vital functions. Hypoxia, flushing, and tachycardia may indicate overdose.

Nursing: Physical Assessment/Monitoring**Institutional:** Continuous pulmonary and hemodynamic arterial monitoring, protimes. **Noninstitutional:** Avoid sudden rate reduction or abrupt withdrawal or interruption of therapy. When adjustment in rate is made, monitor blood pressure (standing and supine) and pulse for several hours to ensure tolerance to new rate. Monitor for bleeding. Monitor (or teach appropriate caregiver or patient to monitor) vital signs on 3 times/day basis. Monitor for improved pulmonary function and improved quality of life. Be alert for any infusion pump malfunction. Assess for signs of overdose (eg, hypoxia, flushing, tachycardia, fever, chills, anxiety, acute headache, tremor, vomiting, diarrhea).

Patient EducationTherapy on this drug will probably be prolonged, possibly for years. You may experience mild headache, nausea or vomiting, diarrhea, weight loss, nervousness, dizziness (use caution when driving or engaging in activities requiring alertness) and some muscular pains (use of a mild analgesia may be recommended by your prescriber). Report immediately any signs or symptoms of acute or severe headache; back pain; increased difficult breathing; flushing; fever or chills; any unusual bleeding or bruising; chest pain; palpitations; irregular, slow or fast pulse; flushing; loss of sensation; or any onset of unresolved diarrhea. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution: 0.5 mg, 1.5 mg [provided with 50 mL sterile diluent]

Flolan®: 0.5 mg, 1.5 mg

Generic AvailableYes

ManufacturerGlaxoSmithKline

Mechanism of ActionEpoprostenol is also known as prostacyclin and PGI_2. It is a strong vasodilator of all vascular beds. In addition, it is a potent endogenous inhibitor of platelet aggregation. The reduction in platelet aggregation results from epoprostenol's activation of intracellular adenylate cyclase and the resultant increase in cyclic adenosine monophosphate concentrations within the platelets. Additionally, it is capable of decreasing thrombogenesis and platelet clumping in the lungs by inhibiting platelet aggregation.

Pharmacodynamics/Kinetics

Metabolism: Rapidly hydrolyzed; subject to some enzymatic degradation; forms one active metabolite and 13 inactive metabolites

Half-life elimination: 6 minutes

Excretion: Urine (84%); feces (4%)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported. Epoprostenol is an inhibitor of platelet aggregation and may enhance the risk of bleeding with other antiplatelet agents (such as aspirin and/or NSAIDs).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusAnxiety, nervousness are common; may cause confusion, insomnia, or depression

Mental Health: Effects on Psychiatric TreatmentHypotensive effects may be exacerbated by low potency antipsychotics (chlorpromazine) and TCAs

Cardiovascular ConsiderationsThe primary role of epoprostenol is in the treatment of primary pulmonary hypertension in patients unresponsive to other therapy. Response to initial therapy is evaluated in a controlled setting before chronic therapy is administered. The role of epoprostenol in the treatment of heart failure confers a negative impact on cardiovascular morbidity and mortality. Clinical trials showed improvement of heart failure symptoms and exercise tolerance, but an increase in mortality.

Index TermsEpoprostenol Sodium; PGI_2; PGX; Prostacyclin

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(ep roe SAR tan & hye droe klor oh THYE a zide)

U.S. Brand NamesTeveten® HCT

Canadian Brand NamesTeveten® HCT; Teveten® Plus

Pharmacologic CategoryAngiotensin II Receptor Blocker; Diuretic, Thiazide

Use: Labeled IndicationsTreatment of hypertension (not indicated for initial treatment)

Dosing: AdultsHypertension: Oral: Dose is individualized (combination substituted for individual components)

Usual recommended dose: Eprosartan 600 mg/hydrochlorothiazide 12.5 mg once daily (maximum dose: Eprosartan 600 mg/hydrochlorothiazide 25 mg once daily)

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentInitial dose adjustments not recommended by manufacturer; carefully monitor patient. Hydrochlorothiazide is ineffective in patients with Cl_{cr} <30 mL/minute.

Dosing: Hepatic ImpairmentInitial dose adjustments not recommended by manufacturer; carefully monitor patient.

Calculations

- Creatinine Clearance: Adults

Dietary ConsiderationsMay be taken with or without food.

StorageStore between 20°C and 25°C (68°F and 77°F)

ContraindicationsHypersensitivity to eprosartan, hydrochlorothiazide, or any component of the formulation; sulfonamide-derived drugs; anuria

Allergy Considerations

- Angiotensin Receptor Antagonist Allergy/Hypersensitivity
- Thiazide/Thiazide-Related Diuretic Allergy

Warnings/Precautions

Boxed warnings:

- Pregnancy: See "Special populations" below.

Concerns related to adverse effects:

- Electrolyte disturbances: Hyperkalemia may occur with angiotensin II receptor antagonists; risk factors include renal dysfunction, diabetes mellitus, and concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salts. Use cautiously, if at all, with these agents and monitor potassium closely. Thiazide diuretics may cause hypokalemia, hypochloremic alkalosis, hypomagnesemia, and hyponatremia.

- Photosensitivity: Photosensitization may occur.

- Renal function deterioration: May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.

- Sulfa allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe. Discontinue if signs of hypersensitivity are noted.

Disease-related concerns:

- Aortic/mitral stenosis: Use with caution in patients with significant aortic/mitral stenosis.

- Diabetes: Use hydrochlorothiazide with caution in patients with prediabetes or diabetes mellitus; may see a change in glucose control.

- Gout: In certain patients with a history of gout, a familial predisposition to gout, or chronic renal failure, gout can be precipitated by hydrochlorothiazide.

- Hepatic impairment: Use caution in patients with moderate hepatic impairment; in cirrhosis, avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy.

- Hypercholesterolemia: Use with caution in patients with moderate or high cholesterol concentrations; increased cholesterol and triglyceride levels have been reported with thiazides.

- Hypovolemia: Avoid use or use a smaller dose in patients who are volume depleted; correct depletion first.

- Renal artery stenosis: Use eprosartan with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.

- Renal impairment: Use eprosartan with caution with pre-existing renal insufficiency and severe renal impairment. Avoid hydrochlorothiazide in severe renal disease (ineffective); may precipitate azotemia; discontinue or consider withholding if renal impairment occurs.

- Systemic lupus erythematosus (SLE): Hydrochlorothiazide can cause SLE exacerbation or activation.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

- Pregnancy: **[U.S. Boxed Warning]: Based on human data, drugs that act on the angiotensin system can cause injury and death to the developing fetus when used in the second and third trimesters. Angiotensin receptor blockers should be discontinued as soon as possible once pregnancy is detected.**

Pregnancy Risk FactorC/D (2nd and 3rd trimesters)
Pregnancy ConsiderationsSee individual agents.
LactationExcretion in breast milk unknown/not recommended
Breast-Feeding ConsiderationsExcretion of eprosartan in breast milk is not known and use during nursing is not recommended; hydrochlorothiazide is excreted in breast milk
Adverse ReactionsPercentages reported with combination product; other reactions have been reported (see individual agents for additional information).

1% to 10%:

Central nervous system: Dizziness (4%), headache (3%), fatigue (2%)

Hematologic: Neutrophil count decreased (1%)

Neuromuscular & skeletal: Back pain (3%)

Renal: BUN increased (1%)

<1%: Anemia, hyperkalemia (0.9%), hypotension, liver enzyme (ALT) increased, myalgia, orthostasis, thrombocytopenia, upper respiratory tract infection; rhabdomyolysis has been reported (rarely) with angiotensin-receptor antagonists

Drug Interactions

ACE Inhibitors: Thiazide Diuretics may enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

ACE Inhibitors: Angiotensin II Receptor Blockers may enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: Thiazide Diuretics may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. Thiazide Diuretics may increase the serum concentration of Allopurinol. Specifically, Thiazide Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Bile Acid Sequestrants: May decrease the absorption of Thiazide Diuretics. The diuretic response is likewise decreased. *Risk D: Consider therapy modification*

Calcitriol: Thiazide Diuretics may enhance the hypercalcemic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Salts: Thiazide Diuretics may decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Dofetilide: Thiazide Diuretics may enhance the QTc-prolonging effect of Dofetilide. Thiazide Diuretics may increase the serum concentration of Dofetilide. *Risk D: Consider therapy modification*

Eplerenone: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: Thiazide Diuretics may decrease the excretion of Lithium. *Risk D: Consider therapy modification*

Lithium: Angiotensin II Receptor Blockers may increase the serum concentration of Lithium. Management: Lithium dosage reductions will likely be needed following the addition of an angiotensin II receptor antagonist. *Risk D: Consider therapy modification*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Potassium Salts: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: Angiotensin II Receptor Blockers may enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Trimethoprim: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Monitoring ParametersBlood pressure; serum electrolytes, BUN, creatinine
Nursing: Physical Assessment/MonitoringSee individual agents.
Monitoring: Lab TestsSerum electrolytes, BUN, creatinine
Patient EducationSee individual agents.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

600 mg/12.5 mg: Eprosartan 600 mg and hydrochlorothiazide 12.5 mg

600 mg/25 mg: Eprosartan 600 mg and hydrochlorothiazide 25 mg

Generic AvailableNo
ManufacturerSolvay Pharmaceuticals
Pricing: U.S. (www.drugstore.com)

Tablets (Teveten HCT)

600-12.5 mg (30): $73.62

Mechanism of Action**Hydrochlorothiazide** inhibits sodium reabsorption in the distal tubules causing increased excretion of sodium and water as well as potassium and hydrogen ions. **Eprosartan** blocks the vasoconstrictor and aldosterone-secreting effects of angiotensin II by selectively blocking the binding of angiotensin II to the AT1 receptor in many tissues, such as vascular smooth muscle and the adrenal gland.
Pharmacodynamics/KineticsSee individual agents.
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause dizziness, fatigue, and depression
Mental Health: Effects on Psychiatric TreatmentMay decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels
Cardiovascular Considerations

Hypertension: According to the 2003 JNC 7 guidelines for the treatment of hypertension, most patients with hypertension will require treatment with at least 2 antihypertensives. First-line therapy for hypertension is a diuretic (eg, hydrochlorothiazide or chlorthalidone). When a diuretic cannot be used or when a compelling indication exists for another drug, other types of antihypertensives may be used (eg, ACEIs, ARBs, beta-blockers, CCBs). Angiotensin II receptor blockers are among the multiple choices of agents that have shown benefit in a number of different patient subtypes. Compelling indications for an ARB include patients with heart failure, diabetes, or chronic kidney disease. The *LIFE trial* (Dahlof, 2002) confirmed that ARB (losartan 50-100 mg daily) was better tolerated than a beta-blocker (atenolol), and resulted in significant reduction in mortality, angina, or HF hospitalization (primary endpoint). Stroke and new-onset diabetes were significantly reduced in the losartan treatment group.

Treatment should be targeted to a goal blood pressure of <140/90 m Hg. If diabetes or renal disease coexists, the blood pressure goal should be <130/80 mm Hg.

Cautions: Similar to ACE inhibitors, pre-existing volume depletion caused by diuretic therapy may potentiate hypotension in response to angiotensin II antagonists. Concomitant NSAID therapy may attenuate blood pressure control; use of NSAIDs should be avoided or limited, with monitoring of blood pressure control. In the setting of heart failure, NSAID use may be associated with an increased risk for fluid accumulation and edema. Because of the lack of effect on the response to bradykinin, angiotensin receptor blockers are less likely to be associated with nonrenin-angiotensin effects such as cough and angioedema. The angiotensin II antagonists do not cause increases in levels of bradykinin as the ACEIs do.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(ep roe SAR tan)

U.S. Brand NamesTeveten®

Canadian Brand NamesTeveten®

Pharmacologic CategoryAngiotensin II Receptor Blocker

Use: Labeled IndicationsTreatment of hypertension; may be used alone or in combination with other antihypertensives

Dosing: AdultsHypertension: Oral: Dosage must be individualized. Can administer once or twice daily with total daily doses of 400-800 mg. Usual starting dose is 600 mg once daily as monotherapy in patients who are euvolemic. Limited clinical experience with doses >800 mg.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNo starting dosage adjustment is necessary; however, carefully monitor the patient.

Dosing: Hepatic ImpairmentNo starting dosage adjustment is necessary; however, carefully monitor the patient.

ContraindicationsHypersensitivity to eprosartan or any component of the formulation

Allergy Considerations

- Angiotensin Receptor Antagonist Allergy/Hypersensitivity

Warnings/Precautions

Boxed warnings:

- Pregnancy: See “Special populations” below.

Concerns related to adverse effects:

- Hyperkalemia: May occur; risk factors include renal dysfunction, diabetes mellitus, concomitant use of potassium-sparing diuretics, potassium supplements and/or potassium containing salts. Use cautiously, if at all, with these agents and monitor potassium closely.
- Renal function deterioration: May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.

Disease-related concerns:

- Aortic/mitral stenosis: Use with caution in patients with significant aortic/mitral stenosis.
- Hypovolemia: Avoid use or use a smaller dose in patients who are volume depleted; correct depletion first.
- Renal artery stenosis: Use eprosartan with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.
- Renal impairment: Use with with pre-existing renal insufficiency and severe renal impairment.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.
- Pregnancy: **[U.S. Boxed Warning]: Based on human data, drugs that act on the angiotensin system can cause injury and death to the developing fetus when used in the second and third trimesters. Angiotensin receptor blockers should be discontinued as soon as possible once pregnancy is detected.**

Geriatric ConsiderationsNo specific dose adjustments are necessary in the elderly due to the drug's major route of elimination. However, since many elderly may be volume depleted due to their “blunted thirst reflex” and use of diuretics, care and monitoring of blood pressure and volume status are necessary upon initiation.

Pregnancy Risk FactorC (1st trimester); D (2nd and 3rd trimesters)

Pregnancy ConsiderationsMedications which act on the renin-angiotensin system are reported to have the following fetal/neonatal effects: Hypotension, neonatal skull hypoplasia, anuria, renal failure, and death; oligohydramnios is also reported. These effects are reported to occur with exposure during the second and third trimesters. There are no adequate and well-controlled studies in pregnant women. **[U.S. Boxed Warning]: Based on human data, drugs that act on the angiotensin system can cause injury and death to the developing fetus when used in the second and third trimesters. Angiotensin receptor blockers should be discontinued as soon as possible once pregnancy is detected.**

LactationNot recommended

Adverse Reactions

1% to 10%:

Central nervous system: Fatigue (2%), depression (1%)

Endocrine & metabolic: Hypertriglyceridemia (1%)

Gastrointestinal: Abdominal pain (2%)

Genitourinary: Urinary tract infection (1%)

Respiratory: Upper respiratory tract infection (8%), rhinitis (4%), pharyngitis (4%), cough (4%)

Miscellaneous: Viral infection (2%), injury (2%)

<1% (Limited to important or life-threatening): Abnormal ECG, abnormal vision, aggravated arthritis, albuminuria, anemia, angina pectoris, anorexia, anxiety, arthritis, arthrosis, asthma, ataxia, atrial fibrillation, back pain, bradycardia, BUN increased, conjunctivitis, constipation, creatine phosphokinase increased, creatinine increased, cystitis, diabetes mellitus, diaphoresis increased, dry mouth, eczema, epistaxis, esophagitis, ethanol intolerance, extrasystoles, facial edema, fatigue, fever, flatulence, furunculosis, gastritis, gastroenteritis, gingivitis, glycosuria, gout, hematuria, herpes simplex, hot flushes, hypercholesterolemia, hyperglycemia, hyper-/hypokalemia, hyponatremia, hypotension, influenza-like symptoms, insomnia, leg cramps, leukopenia, maculopapular rash, malaise, micturition frequency, migraine, nausea, nervousness, neuritis, neutropenia, orthostasis, otitis externa, otitis media, pain, palpitation, paresthesia, periodontitis, peripheral edema, peripheral ischemia, polyuria, pruritus, purpura, rash, renal calculus, rigors, skeletal pain, somnolence, substernal chest pain, tachycardia, tendonitis, thrombocytopenia, tinnitus, toothache, transaminases increased, tremor, urinary incontinence, vertigo, vomiting, weakness, xerophthalmia

Rhabdomyolysis has been reported (rarely) with angiotensin-receptor antagonists.

Metabolism/Transport Effects**Inhibits** CYP2C9 (weak)

Drug Interactions

ACE Inhibitors: Angiotensin II Receptor Blockers may enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Eplerenone: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: Angiotensin II Receptor Blockers may increase the serum concentration of Lithium. Management: Lithium dosage reductions will likely be needed following the addition of an angiotensin II receptor antagonist. *Risk D: Consider therapy modification*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Potassium Salts: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: Angiotensin II Receptor Blockers may enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Trimethoprim: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid dong quai if using for hypertension (has estrogenic activity). Avoid ephedra, yohimbe, ginseng (may worsen hypertension). Avoid garlic (may have increased antihypertensive effect).

Nursing: Physical Assessment/MonitoringUse caution in presence of renal impairment. Assess potential for interactions with other pharmacological agents or herbal products patient may be taking (especially anything that may impact blood pressure). Assess results of laboratory tests, therapeutic effectiveness, and adverse response (eg, hypotension) on a regular basis during therapy. Teach patient appropriate use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsElectrolytes, serum creatinine, BUN, urinalysis

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take exactly as directed and do not discontinue without consulting prescriber. This drug does not eliminate need for diet or exercise regimen as recommended by prescriber. May cause dizziness, fainting, or lightheadedness (use caution when driving or engaging in tasks that require alertness until response to drug is known); or postural hypotension (use caution when rising from lying or sitting position or climbing stairs). Report chest pain or palpitations; respiratory infection or cold symptoms; unusual cough; swelling of face, tongue, lips, or extremities; changes in urinary pattern; extreme fatigue; or other adverse response. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. This drug should not be used in the 2nd or 3rd trimester of pregnancy. Consult prescriber for appropriate contraceptive measures if necessary or if you suspect you might be pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablets (Teveten)

400 mg (30): $64.18

Mechanism of ActionAngiotensin II is formed from angiotensin I in a reaction catalyzed by angiotensin-converting enzyme (ACE, kininase II). Angiotensin II is the principal pressor agent of the renin-angiotensin system, with effects that include vasoconstriction, stimulation of synthesis and release of aldosterone, cardiac stimulation, and renal reabsorption of sodium. Eprosartan blocks the vasoconstrictor and aldosterone-secreting effects of angiotensin II by selectively blocking the binding of angiotensin II to the AT1 receptor in many tissues, such as vascular smooth muscle and the adrenal gland. Its action is therefore independent of the pathways for angiotensin II synthesis. Blockade of the renin-angiotensin system with ACE inhibitors, which inhibit the biosynthesis of angiotensin II from angiotensin I, is widely used in the treatment of hypertension. ACE inhibitors also inhibit the degradation of bradykinin, a reaction also catalyzed by ACE. Because eprosartan does not inhibit ACE (kininase II), it does not affect the response to bradykinin. Whether this difference has clinical relevance is not yet known. Eprosartan does not bind to or block other hormone receptors or ion channels known to be important in cardiovascular regulation.
Pharmacodynamics/Kinetics

Protein binding: 98%

Metabolism: Minimally hepatic

Bioavailability: 300 mg dose: 13%

Half-life elimination: Terminal: 5-9 hours

Time to peak, serum: Fasting: 1-2 hours

Excretion: Feces (90%); urine (7%, mostly as unchanged drug)

Clearance: 7.9 L/hour

Related Information

- Angiotensin Agents

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause fatigue or depression
Mental Health: Effects on Psychiatric TreatmentRisk of lithium toxicity may be increased by eprosartan; monitor lithium levels
Cardiovascular Considerations

Hypertension: According to the 2003 JNC 7 guidelines for the treatment of hypertension, most patients with hypertension will require treatment with at least 2 antihypertensives. First-line therapy for hypertension is a diuretic (eg, hydrochlorothiazide or chlorthalidone). When a diuretic cannot be used or when a compelling indication exists for another drug, other types of antihypertensives may be used (eg, ACEIs, ARBs, beta-blockers, CCBs). Angiotensin II receptor blockers are among the multiple choices of agents that have shown benefit in a number of different patient subtypes. Compelling indications for an ARB include patients with heart failure, diabetes, or chronic kidney disease. The *LIFE trial* (Dahlof, 2002) confirmed that ARB (losartan 50-100 mg daily) was better tolerated than a beta-blocker blocker (atenolol), and resulted in significant reduction in mortality, angina, or HF hospitalization (primary endpoint). Stroke and new-onset diabetes were significantly reduced in the losartan treatment group.

Treatment should be targeted to a goal blood pressure of <140/90 mm Hg. If diabetes or renal disease coexists, the blood pressure goal should be <130/80 mm Hg.

Cautions: Similar to ACE inhibitors, pre-existing volume depletion caused by diuretic therapy may potentiate hypotension in response to angiotensin II antagonists. Concomitant NSAID therapy may attenuate blood pressure control; use of NSAIDs should be avoided or limited, with monitoring of blood pressure control. In the setting of heart failure, NSAID use may be associated with an increased risk for fluid accumulation and edema. Because of the lack of effect on the response to bradykinin, angiotensin receptor blockers are less likely to be associated with nonrenin-angiotensin effects such as cough and angioedema. The angiotensin II antagonists do not cause increases in levels of bradykinin as the ACEIs do.

Anesthesia and Critical Care Concerns/Other ConsiderationsThe angiotensin II receptor antagonists appear to have similar indications as the ACE inhibitors. In heart failure, the angiotensin II antagonists are especially useful in providing an alternative therapy in those patients who have intractable cough in response to ACE inhibitor therapy. Candesartan has been studied as an alternative therapy in chronic heart failure patients who cannot tolerate an ACE-I (CHARM-Alternative) and as an added therapy in heart failure patients who are maintained on an ACE-I (CHARM-Added). In both studies, the combined endpoint of cardiovascular death or heart failure hospitalizations was significantly improved over the placebo-treated group. Similar to ACE inhibitors, pre-existing volume depletion caused by diuretic therapy may potentiate hypotension in response to angiotensin II antagonists. Concomitant NSAID therapy may attenuate blood pressure control; use of NSAIDs should be avoided or limited, with monitoring of blood pressure control. In the setting of heart failure, NSAID use may be associated with an increased risk for fluid accumulation and edema.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(ep TIF i ba tide)

U.S. Brand NamesIntegrilin®

Canadian Brand NamesIntegrilin®

Pharmacologic CategoryAntiplatelet Agent, Glycoprotein IIb/IIIa Inhibitor

Use: Labeled IndicationsTreatment of patients with acute coronary syndrome (unstable angina/non-Q wave myocardial infarction [UA/NQMI]), including patients who are to be managed medically and those undergoing percutaneous coronary intervention (PCI including angioplasty, intracoronary stenting)

Dosing: Adults

Acute coronary syndrome: I.V.: Bolus of 180 mcg/kg (maximum: 22.6 mg) over 1-2 minutes, begun as soon as possible following diagnosis, followed by a continuous infusion of 2 mcg/kg/minute (maximum: 15 mg/hour) until hospital discharge or initiation of CABG surgery, up to 72 hours. Concurrent aspirin and heparin therapy (target aPTT 50-70 seconds) are recommended.

Percutaneous coronary intervention (PCI) with or without stenting: I.V.: Bolus of 180 mcg/kg (maximum: 22.6 mg) administered immediately before the initiation of PCI, followed by a continuous infusion of 2 mcg/kg/minute (maximum: 15 mg/hour). A second 180 mcg/kg bolus (maximum: 22.6 mg) should be administered 10 minutes after the first bolus. Infusion should be continued until hospital discharge or for up to 18-24 hours, whichever comes first. Concurrent aspirin (160-325 mg 1-24 hours before PCI and daily thereafter) and heparin therapy (ACT 200-300 seconds during PCI) are recommended. Heparin infusion after PCI is discouraged. In patients who undergo coronary artery bypass graft surgery, discontinue infusion prior to surgery.

Dosing: ElderlyRefer to adult dosing. No dosing adjustment for the elderly appears to be necessary; adjust carefully to renal function.

Dosing: Renal ImpairmentDialysis is a contraindication to use.

Note: The Cockroft-Gault equation using actual body weight sould be used to estimate renal function.

Acute coronary syndrome: Cl_{cr} <50 mL/minute: Use 180 mcg/kg bolus (maximum: 22.6 mg) and 1 mcg/kg/minute infusion (maximum: 7.5 mg/hour)

Percutaneous coronary intervention (PCI) with or without stenting: Cl_{cr} <50 mL/minute: Use 180 mcg/kg bolus (maximum: 22.6 mg) administered immediately before the initiation of PCI and followed by a continuous infusion of 1 mcg/kg/minute (maximum: 7.5 mg/hour). A second 180 mcg/kg (maximum: 22.6 mg) bolus should be administered 10 minutes after the first bolus.

Calculations

- Creatinine Clearance: Adults
- Eptifibatide

Administration: I.V.Do not shake vial. Administer bolus doses by I.V. push over 1-2 minutes. Begin continuous infusion immediately following bolus administration; administer directly from the 100 mL vial.

Administration: I.V. DetailVisually inspect for discoloration or particulate matter prior to administration. The bolus dose should be withdrawn from the 10 mL vial into a syringe. The 100 mL vial should be spiked with a vented infusion set.

StorageVials should be stored refrigerated at 2°C to 8°C (36°F to 46°F). Vials can be kept at room temperature for 2 months. Protect from light until administration. Do not use beyond the expiration date. Discard any unused portion left in the vial.

CompatibilityMay be administered in same I.V. line as alteplase, atropine, dobutamine, heparin, lidocaine, meperidine, metoprolol, midazolam, morphine, nitroglycerin, verapamil, normal saline (infusion may contain up to 60 mEq/L KCl), normal saline/D_5W (infusion may contain up to 60 mEq/L KCl).

ContraindicationsHypersensitivity to eptifibatide or any component of the product; active abnormal bleeding or a history of bleeding diathesis within the previous 30 days; history of CVA within 30 days or a history of hemorrhagic stroke; severe hypertension (systolic blood pressure >200 mm Hg or diastolic blood pressure >110 mm Hg) not adequately controlled on antihypertensive therapy; major surgery within the preceding 6 weeks; current or planned administration of another parenteral GP IIb/IIIa inhibitor; thrombocytopenia; dependency on renal dialysis

Allergy Considerations

- Glycoprotein (GP) IIb/IIIa Inhibitor Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Bleeding: The most common complication is bleeding, including retroperitoneal, pulmonary, and spontaneous GI and/or GU bleeding;

watch closely for bleeding, especially the arterial access site for the cardiac catheterization. Use with extreme caution in patients with platelet counts <150,000/mm^3, patients with hemorrhagic retinopathy, previous history of GI disease, recent thrombolytic therapy and in chronic dialysis patients. Use caution with administration of other drugs affecting hemostasis. Minimize other procedures including arterial and venous punctures, I.M. injections, nasogastric tubes, etc.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal dysfunction (estimated Cl_{cr} <50 mL/minute); dosage adjustment required.

Concurrent drug therapy issues:

- Thrombolytic agents: Concurrent use with thrombolytics has not been established as safe.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Sheath removal: Prior to pulling the sheath, heparin should be discontinued for 3-4 hours and ACT <180 seconds or aPTT <45 seconds. Use standard compression techniques after sheath removal. Watch the site closely afterwards for further bleeding.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsBleeding is the major drug-related adverse effect. Access site is often primary source of bleeding complications. Incidence of bleeding is also related to heparin intensity. Patients weighing <70 kg may have an increased risk of major bleeding.

>10%: Hematologic: Bleeding (major: 1% to 11%; minor: 3% to 14%; transfusion required: 2% to 13%)

1% to 10%:

Cardiovascular: Hypotension (up to 7%)

Hematologic: Thrombocytopenia (1% to 3%)

Local: Injection site reaction

<1% (Limited to important or life-threatening): Anaphylaxis, intracranial hemorrhage (0.5% to 0.7%), stroke

Postmarketing and/or case reports: Acute profound thrombocytopenia, fatal bleeding events, GI hemorrhage, pulmonary hemorrhage

Drug Interactions

Anticoagulants: Antiplatelet Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the anticoagulant effect of other Antiplatelet Agents. *Risk C: Monitor therapy*

Dasatinib: May enhance the anticoagulant effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Drotrecogin Alfa: Antiplatelet Agents may enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Antiplatelet Agents. Bleeding may occur. *Risk D: Consider therapy modification*

Ibritumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to impaired platelet function and an increased risk of bleeding. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

Omega-3-Acid Ethyl Esters: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the adverse/toxic effect of Antiplatelet Agents. Specifically, the risk of bleeding may be increased by concurrent use of these agents. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Salicylates: Antiplatelet Agents may enhance the adverse/toxic effect of Salicylates. Increased risk of bleeding may result. *Risk C: Monitor therapy*

Thrombolytic Agents: Antiplatelet Agents may enhance the anticoagulant effect of Thrombolytic Agents. *Risk C: Monitor therapy*

Tositumomab and Iodine I 131 Tositumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse events may be increased. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid alfalfa, anise, bilberry, bladderwrack, bromelain, cat's claw, celery, coleus, cordyceps, dong quai, evening primrose oil, fenugreek, feverfew, garlic, ginger, ginkgo biloba, ginseng (American), ginseng (Panax), ginseng (Siberian), grapeseed, green tea, guggul, horse chestnut seed, horseradish, licorice, prickly ash, red clover, reishi, same (s-adenosylmethionine), sweet clover, turmeric, and white willow (all have additional antiplatelet activity).

Monitoring ParametersCoagulation parameters, signs/symptoms of excessive bleeding. Laboratory tests at baseline and monitoring during therapy: hematocrit and hemoglobin, platelet count, serum creatinine, PT/aPTT (maintain aPTT between 50-70 seconds unless PCI is to be performed), and ACT with PCI (maintain ACT between 200-300 seconds during PCI).

Assess sheath insertion site and distal pulses of affected leg every 15 minutes for the first hour and then every 1 hour for the next 6 hours. Arterial access site care is important to prevent bleeding. Care should be taken when attempting vascular access that only the anterior wall of the femoral artery is punctured, avoiding a Seldinger (through and through) technique for obtaining sheath access. Femoral vein sheath placement should be avoided unless needed. While the vascular sheath is in place, patients should be maintained on complete bedrest with the head of the bed at a 30° angle and the affected limb restrained in a straight position.

Observe patient for mental status changes, hemorrhage, assess nose and mouth mucous membranes, puncture sites for oozing, ecchymosis and hematoma formation, and examine urine, stool and emesis for presence of occult or frank blood; gentle care should be provided when removing dressings.

Nursing: Physical Assessment/MonitoringAssess other medications (including herbal products) for possible interactions or additive effects. Monitor vital signs and laboratory results prior to, during, and after therapy. Monitor closely for signs of excessive/unusual bleeding. Observe and teach patient bleeding precautions and adverse reactions to report.

Monitoring: Lab TestsLaboratory tests at baseline and monitoring during therapy: Hematocrit and hemoglobin, platelet count, serum creatinine, PT/aPTT (maintain aPTT between 50-70 seconds unless PCI is to be performed), and ACT with PCI (maintain ACT between 200-300 seconds during PCI). Prior to sheath removal, the aPTT or ACT should be checked (do not remove unless aPTT is <45 seconds or the ACT <150 seconds).

Patient EducationEmergency use may dictate depth of patient education. This medication can only be administered intravenously. You will have a tendency to bleed easily following this medication. Use caution to prevent injury (use electric razor, use soft toothbrush, use caution with sharps). If bleeding occurs, apply pressure to bleeding spot until bleeding stops completely. Report unusual bruising or bleeding (eg, blood in urine, stool, or vomitus, bleeding gums), dizziness or vision changes, or back pain. **Breast-feeding precaution:** Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: 0.75 mg/mL (100 mL); 2 mg/mL (10 mL, 100 mL)

Generic AvailableNo

ManufacturerCOR Therapeutics

Mechanism of ActionEptifibatide is a cyclic heptapeptide which blocks the platelet glycoprotein IIb/IIIa receptor, the binding site for fibrinogen, von Willebrand factor, and other ligands. Inhibition of binding at this final common receptor reversibly blocks platelet aggregation and prevents thrombosis.

Pharmacodynamics/Kinetics

Onset of action: Within 1 hour

Duration: Platelet function restored ~4 hours following discontinuation

Protein binding: ~25%

Half-life elimination: 2.5 hours

Excretion: Primarily urine (as eptifibatide and metabolites); significant renal impairment may alter disposition of this compound

Clearance: Total body: 55-58 mL/kg/hour; Renal: ~50% of total in healthy subjects

Related Information

- Glycoprotein Antagonists

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Bleeding; patients weighing <70 kg may have an increased risk of major bleeding.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentContraindicated in patients with a recent stroke (within 30 days)

Cardiovascular Considerations

Acute Coronary Syndromes (ACS): The 2002 ACC/AHA unstable angina/non-ST-segment elevation myocardial infarction (UA/NSTEMI) guidelines recommend administration of intravenous glycoprotein IIb/IIIa inhibitors (along with aspirin and heparin) in patients with non-ST-segment elevation ACS with high-risk features (eg, positive biochemical markers of infarction, ST-segment depression, or signs of LV dysfunction) or refractory ischemia. Eptifibatide or tirofiban (with ASA and LMWH or UFH) should be chosen in patients who have high-risk features where an invasive management strategy is not planned. In addition, a glycoprotein IIb/IIIa inhibitor is recommended for patients who will undergo percutaneous coronary intervention (PCI).

Platelet Effects: Eptifibatide has a short duration of action and hemostasis is restored within ~4 hours after discontinuation in patients with normal renal function. Acute profound thrombocytopenia has been associated with eptifibatide use. (Nagge J, 2003; Rezkalla SH, 2003; Salengro E, 2003)

Anesthesia and Critical Care Concerns/Other ConsiderationsEptifibatide has a short duration of action and hemostasis is restored within about 4 hours after discontinuation in patients with normal renal function. Acute profound thrombocytopenia has been associated with eptifibatide use. (Nagge, 2003; Rezkalla, 2003; Salengro, 2003)

Medication Safety Issues

Sound-alike/look-alike issues:

Calciferol™ may be confused with calcitriol

Drisdol® may be confused with Drysol™

Pronunciation(er goe kal SIF e role)
U.S. Brand NamesDrisdol®
Canadian Brand NamesDrisdol®; Ostoforte®
Pharmacologic Category[Vitamin D Analog]
Use: Labeled IndicationsTreatment of refractory rickets, hypophosphatemia, hypoparathyroidism; dietary supplement
Use: Unlabeled/InvestigationalPrevention and treatment of vitamin D deficiency in patients with chronic kidney disease (CKD)
Dosing: Adults**Note:** 1 mcg = 40 int. units

Adequate intake: Oral:

18-50 years: 5 mcg/day (200 int. units/day)

51-70 years: 10 mcg/day (400 int. units/day)

Elderly >70 years: 15 mcg/day (600 int. units/day)

Dietary supplementation: Oral: 10 mcg/day (400 int. units/day)

Vitamin D deficiency/insufficiency in patients with CKD stages 3-4 (K/DOQI guidelines): **Note:** Dose is based on 25-hydroxyvitamin D serum level [25(OH) D]: Oral (treatment duration should be a total of 6 months):

Serum 25(OH)D <5 ng/mL:

50,000 int. units/week for 12 weeks, then 50,000 int. units/month

Serum 25(OH)D 5-15 ng/mL:

50,000 int. units/week for 4 weeks, then 50,000 int. units/month

Serum 25(OH)D 16-30 ng/mL:

50,000 int. units/month

Hypoparathyroidism: Oral: 625 mcg to 5 mg/day (25,000-200,000 int. units) and calcium supplements

Nutritional rickets and osteomalacia: Oral:

Adults with normal absorption: 25-125 mcg/day (1000-5000 int. units)

Adults with malabsorption: 250-7500 mcg (10,000-300,000 int. units)

Vitamin D-*dependent* rickets: Oral: 250 mcg to 1.5 mg/day (10,000-60,000 int. units)

Vitamin D-*resistant* rickets: Oral: 12,000-500,000 int. units/day

Familial hypophosphatemia: Oral: 10,000-60,000 int. units plus phosphate supplements

Dosing: ElderlyRefer to adult dosing (see Geriatric Considerations and Additional Information).

Adequate intake (each 1 mcg = 40 int. units): >70 years: Oral: 15 mcg/day (600 int. units/day)

Dosing: Pediatric**Note:** 1 mcg = 40 int. units

Adequate intake: Oral: Infants and Children: 5 mcg/day (200 int. units/day)

Dietary supplementation: Infants and Children: Oral: 10 mcg/day (400 int. units/day)

Vitamin D deficiency/insufficiency in patients with CKD stages 3-4 (K/DOQI guidelines): **Note:** Dose is based on 25-hydroxyvitamin D serum level [25(OH) D]: Oral (treatment duration should be a total of 3 months):

Serum 25(OH)D <5 ng/mL:

8000 int. units/day for 4 weeks, then 4000 int. units/day for 2 months **or**

50,000 int. units/week for 4 weeks, then 50,000 int. units twice a month for 2 months

Serum 25(OH)D 5-15 ng/mL:

4000 int units/day **or**

50,000 int units every other week

Serum 25(OH)D 16-30 ng/mL:

2000 int. units/day **or**

50,000 int. units every 4 weeks

Hypoparathyroidism: Oral: 1.25-5 mg/day (50,000-200,000 int. units) and calcium supplements

Nutritional rickets and osteomalacia: Oral:

Children with normal absorption: 25-125 mcg/day (1000-5000 int. units)

Children with malabsorption: 250-625 mcg/day (10,000-25,000 int. units)

Vitamin D-*dependent* rickets: Oral: 75-125 mcg/day (3000-5000 int. units); maximum: 1500 mcg/day

Vitamin D-*resistant* rickets: Oral: 12,000-500,000 int. units/day

Familial hypophosphatemia: Oral: 40,000-80,000 int. units plus phosphate supplements; dose may be reduced once growth is complete

Dietary ConsiderationsVitamin D is found in fish, fortified milk, fortified cereal, and infant formulas; it is also produced by exposure to sunlight. Multivitamin supplements containing vitamin D may be needed for infants who are exclusively breastfed or who receive <500 mL/day of formula, and children/adolescents without regular sunlight exposure or who are not ingesting at least 500 mL/day of fortified milk.

Supplemental calcium and/or phosphorous may be required depending on the indication for therapy. Alternately, a low phosphate diet and/or the use of a nonaluminum-binding agent may be required.

StorageStore at room temperature of 15°C to 30°C (59°F to 86°F). Protect from light.

ContraindicationsHypersensitivity to ergocalciferol or any component of the formulation; hypercalcemia; malabsorption syndrome; hypervitaminosis D or abnormal sensitivity to the toxic effects of vitamin D

Warnings/Precautions

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease.
- Renal impairment: Use with caution in patients with renal impairment or diseases that may impair vitamin D metabolism.
- Rickets: The range between therapeutic and toxic doses is narrow in vitamin D-resistant rickets; adjust dose based on clinical response to avoid toxicity.

Dosage form specific issues:

- Tartrazine: Products may contain tartrazine, which may cause allergic reactions in certain individuals.

Other warnings/precautions:

- Appropriate use: Adequate calcium supplementation is required; calcium and phosphorous levels must be monitored during therapy.
- Toxicity: Effects of vitamin D can last ≥2 months after therapy is discontinued.

Geriatric ConsiderationsVitamin D, folate, and B_{12} (cyanocobalamin) have decreased absorption with age (clinical significance unknown); studies in ill geriatrics demonstrated that low serum concentrations of vitamin D result in greater bone loss. Calorie requirements decrease with age and therefore, nutrient density must be increased to ensure adequate nutrient intake, including vitamins and minerals. The use of a daily supplement with a multiple vitamin with minerals is recommended because elderly consume less vitamin D, absorption may be decreased, and many have decreased sun exposure. This is a recommendation of particular need to those with high risk for osteoporosis.

Pregnancy Risk FactorC (manufacturer); A/C (dose exceeding RDA recommendation; per expert analysis)

Pregnancy ConsiderationsAbnormalities have been observed in animal studies with maternal doses causing hypervitaminosis D. Doses larger than the RDA should be avoided during pregnancy.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsSmall quantities of vitamin D are found in breast milk following normal maternal exposure via sunlight and diet. The amount in breast milk does not correlate with serum levels in the infant. Hypercalcemia has been noted in a breast-feeding infant following maternal use of large doses of ergocalciferol.

Adverse ReactionsFrequency not defined.

Cardiovascular: Hypertension, vascular calcification

Central nervous system: Mental retardation

Endocrine & metabolic: Acidosis, growth suppression (children), hyperphosphatemia, polydypsia

Gastrointestinal: Anorexia, constipation, nausea, weight loss

Hematologic: Anemia

Neuromuscular & skeletal: Aches, osteoporosis (adults), stiffness, weakness

Renal: Azotemia (reversible), hypercalciuria, nephrocalcinosis, nocturia, polyuria, renal dysfunction

Miscellaneous: Dwarfism (children); soft tissue calcification (blood vessels, heart, lungs, renal tubules)

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersSerum calcium, creatinine, BUN, and phosphorus every 1-2 weeks; x-ray bones monthly until stabilized; signs and symptoms of vitamin D intoxication

Vitamin D deficiency/insufficiency in patients with CKD stages 3-4: Measure serum 25(OH)D levels after 3 months of treatment in children or after 6 months in adults. Discontinue ergocalciferol (or any vitamin D supplements) if the corrected total serum calcium level is >10.2 mg/dL.

Reference Range

Serum calcium times phosphorus should not exceed 70 mg^2/dL^2 to avoid ectopic calcification

Vitamin D insufficiency: Serum 25(OH)D <27-32 ng/mL

CKD K/DOQI guidelines definition of stages; chronic disease is kidney damage or GFR <60 mL/minute/1.73 m^2 for ≥3 months:

Stage 2: GFR 60-89 mL/minute/1.73 m^2 (kidney damage with mild decrease GFR)

Stage 3: GFR 30-59 mL/minute/1.73 m^2 (moderate decrease GFR)

Stage 4: GFR 15-29 mL/minute/1.73 m^2 (severe decrease GFR)

Stage 5: GFR <15 mL/minute/1.73 m^2 or dialysis (kidney failure)

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Assess results of laboratory tests, therapeutic effectiveness, and adverse effects at beginning of therapy and regularly with long-term use. Monitor growth in children. Teach patient appropriate nutritional counseling, possible side effects/interventions, and adverse symptoms to report.

Monitoring: Lab TestsSerum calcium, creatinine, BUN, phosphorus every 1-2 weeks

Vitamin D deficiency/insufficiency in patients with CKD stages 3-4: measure serum 25(OH)D levels after 3 months of treatment in children or after 6 months in adults. Discontinue ergocalciferol (or any vitamin D supplements) if the corrected total serum calcium level is >10.2 mg/dL.

Patient EducationTake exact dose prescribed; do not take more than recommended. Your prescriber may recommend a special diet; do not increase calcium intake without consulting prescriber. Avoid magnesium supplements or magnesium-containing antacids. You may experience nausea, vomiting, or metallic taste (small frequent meals, frequent mouth care, or sucking hard candy may help). Report chest pain or palpitations; acute headache, dizziness, or feeling of weakness; unresolved nausea or vomiting; persistent metallic taste; unrelieved muscle or bone pain; or CNS irritability. **Pregnancy precaution:** Inform prescriber if you are pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Drisdol®: 50,000 int. units [1.25 mg; contains tartrazine and soybean oil]

Liquid, oral [drops]:

Drisdol®: 8000 int. units/mL (60 mL) [200 mcg/mL; OTC]

Tablet: 400 int. units [10 mcg; OTC]

Generic AvailableYes: Tablet

Pricing: U.S. (www.drugstore.com)

Capsules (Vitamin D)

50000 unit (30): $48.17

Solution (Calciferol)

8000 units/mL (60): $91.99

Mechanism of ActionStimulates calcium and phosphate absorption from the small intestine, promotes secretion of calcium from bone to blood; promotes renal tubule phosphate resorption

Pharmacodynamics/Kinetics

Onset of action: Peak effect: ~1 month following daily doses

Absorption: Readily; requires bile

Metabolism: Inactive until hydroxylated hepatically and renally to calcifediol and then to calcitriol (most active form)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Metallic taste and xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause irritability or drowsiness; may rarely cause psychosis

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsActivated Ergosterol; Viosterol; Vitamin D_2

Jump To Field (Select Field Name)

Pronunciation(ER goe loid MES i lates)

Canadian Brand NamesHydergine®

Pharmacologic CategoryErgot Derivative

Use: Labeled IndicationsTreatment of cerebrovascular insufficiency in primary progressive dementia, Alzheimer's dementia, and senile onset

Dosing: AdultsPrimary progressive dementia, Alzheimer's dementia: Oral: 1 mg 3 times/day up to 4.5-12 mg/day; up to 6 months of therapy may be necessary

Dosing: ElderlyRefer to adult dosing.

Dietary ConsiderationsShould not eat or drink while tablet dissolves under tongue.

ContraindicationsHypersensitivity to ergot or any component of the formulation; acute or chronic psychosis; ergot alkaloids are contraindicated with potent inhibitors of CYP3A4 (includes protease inhibitors, azole antifungals, and some macrolide antibiotics)

Allergy Considerations

- Ergot Alkaloid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Cardiac valvular fibrosis: Ergot alkaloids have been associated with fibrotic valve thickening (eg, aortic, mitral, tricuspid); usually associated with long-term, chronic use.
- Pleural/retroperitoneal fibrosis: Rare cases of pleural and/or retroperitoneal fibrosis have been reported with prolonged daily use.

Concurrent drug therapy issues:

- CYP3A4 inhibitors: Concomitant use with potent inhibitors of CYP3A4 (includes protease inhibitors, azole antifungals, and some macrolide antibiotics) and ergot alkaloids has been associated with acute ergot toxicity (ergotism); certain ergot alkaloids (eg, ergotamine and dihydroergotamine) are contraindicated by the manufacturer.

Special populations:

- Elderly: Use with caution.
- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsErgoloid mesylates have no role in the treatment of dementia. Many clinicians regard it as no better than placebo and most patients do not experience significant benefits. Improvement in social function has been shown in some studies, but no consistent improvement in memory or cognitive function was reported.

Pregnancy Risk FactorC

Adverse ReactionsAdverse effects are minimal; most common include transient nausea, gastrointestinal disturbances and sublingual irritation with SL tablets; other common side effects include:

Cardiovascular: Orthostatic hypotension, bradycardia

Dermatologic: Skin rash, flushing

Ocular: Blurred vision

Respiratory: Nasal congestion

Metabolism/Transport Effects**Substrate** of CYP3A4 (major)

Drug Interactions

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Efavirenz: May enhance the adverse/toxic effect of Ergot Derivatives. Specifically, the risk for peripheral vasospasm and ischemia may be increased. *Risk X: Avoid combination*

Macrolide Antibiotics: May enhance the adverse/toxic effect of Ergot Derivatives. Specifically leading the development of ergotism. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Posaconazole: May increase the serum concentration of Ergot Derivatives. *Risk X: Avoid combination*

Protease Inhibitors: May decrease the metabolism of Ergot Derivatives. *Risk X: Avoid combination*

Serotonin 5-HT1D Receptor Agonists: Ergot Derivatives may enhance the vasoconstricting effect of Serotonin 5-HT1D Receptor Agonists. Serotonin 5-HT1D Receptor Agonists may enhance the vasoconstricting effect of Ergot Derivatives. *Risk X: Avoid combination*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Ergot Derivatives. This may cause serotonin syndrome. *Risk X: Avoid combination*

Voriconazole: May increase the serum concentration of Ergot Derivatives. *Risk X: Avoid combination*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 1 mg

Tablet, sublingual: 1 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Sublingual (Ergoloid Mesylates)

1 mg (30): $21.99

Tablets (Ergoloid Mesylates)

1 mg (30): $85.99

Mechanism of ActionErgoloid mesylates do not have the vasoconstrictor effects of the natural ergot alkaloids; exact mechanism in dementia is unknown; originally classed as peripheral and cerebral vasodilator, now considered a “metabolic enhancer”; there is no specific evidence which clearly establishes the mechanism by which ergoloid mesylate preparations produce mental effects, nor is there conclusive evidence that the drug particularly affects cerebral arteriosclerosis or cerebrovascular insufficiency

Pharmacodynamics/Kinetics

Absorption: Rapid yet incomplete

Half-life elimination, serum: 3.5 hours

Time to peak, serum: ~1 hour

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Orthostatic hypotension.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentContraindicated in individuals with psychosis

Index TermsDihydroergotoxine; Dihydrogenated Ergot Alkaloids; Hydergine [DSC]

Ergonovine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(er goe NOE veen)

U.S. Brand NamesErgotrate®

Pharmacologic CategoryErgot Derivative

Use: Labeled IndicationsPrevention and treatment of postpartum and postabortion hemorrhage caused by uterine atony or subinvolution

Use: Unlabeled/InvestigationalDiagnostically to identify Prinzmetal's angina

Dosing: AdultsTreatment/prevention of postpartum or postabortion hemorrhage:

I.M., I.V. (I.V. should be reserved for emergency use only): 0.2 mg, may repeat dose in 2-4 hours if needed

Oral, SL:

Immediate post-partum: 0.2 mg (usually given I.M. or I.V)

Late post-partum: 0.2-0.4 mg every 6-12 hours until danger of uterine atony has passed (usually ~48 hours)

Dosing: ElderlyRefer to adult dosing.

Administration: I.V.I.V. use should be limited to patients with severe uterine bleeding or other life-threatening emergency situations. I.V. doses should be administered over a period of not <1 minute.

Administration: I.V. DetailDilute in NS to 5 mL for I.V. administration.

pH: 2.7-3.5

Administration: OralOral tablets may also be administered sublingually.

Storage

Injection: Store at <46°F; protect from light. May store at room temperature for up to 60 days. Do not use if discoloration occurs.

Tablet: Store at controlled room temperature of 15°C to 30°C (59°F to 86°F).

Compatibility**Compatibility when admixed: Compatible:** Amikacin, sodium bicarbonate.

ContraindicationsHypersensitivity to ergonovine or any component of the formulation; ergot alkaloids are contraindicated with potent inhibitors of CYP3A4 (includes protease inhibitors, azole antifungals, and some macrolide antibiotics); induction of labor, threatened spontaneous abortion, pregnancy

Allergy Considerations

- Ergot Alkaloid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Cardiac valvular fibrosis: Ergot alkaloids have been associated with fibrotic valve thickening (eg, aortic, mitral, tricuspid); usually associated with long-term, chronic use.
- Ergotism: Ergot alkaloid use may result in ergotism (intense vasoconstriction) resulting in peripheral vascular ischemia and possible gangrene. Ergotism is usually associated with overdosage or prolonged chronic use; do not exceed dosing guidelines and avoid prolonged administration.
- Pleural/retroperitoneal fibrosis: Rare cases of pleural and/or retroperitoneal fibrosis have been reported with prolonged daily use.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (eg, hypertension).
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Hypocalcemia: Restore uterine responsiveness in calcium-deficient patients who do not respond to ergonovine by I.V. calcium administration.
- Renal impairment: Use with caution in patients with renal impairment.
- Sepsis: Use with caution in patients with sepsis.
- Vascular disease: Use with caution in patients with obliterative vascular disease.

Concurrent drug therapy issues:

- CYP3A4 inhibitors: Concomitant use with potent inhibitors of CYP3A4 (includes protease inhibitors, azole antifungals, and some macrolide antibiotics) and ergot alkaloids has been associated with acute ergot toxicity (ergotism); certain ergot alkaloids (eg, ergotamine and dihydroergotamine) are contraindicated by the manufacturer.

Special populations:

- Elderly: Use with extreme caution or avoid use in the elderly; due to vasoconstrictive properties and cardiovascular adverse effects associated with ergot alkaloids.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- I.V. administration: Use with extreme caution when administering intravenously; risk of inducing sudden hypertensive and cerebrovascular accidents.

Pregnancy ConsiderationsAdministration causes hyperstimulation of the uterus and may cause uterine tetany, decreased uteroplacental blood flow, uterine rupture, cervical and perineal lacerations, amniotic fluid embolism, and possible trauma to the infant. Ergonovine is used in the third stage of labor for the prevention and treatment of postpartum hemorrhage; use is contraindicated during pregnancy.

Adverse ReactionsFrequency not defined.

Cardiovascular: Hypertension, MI, shock

Gastrointestinal: Nausea, vomiting

Miscellaneous: Allergic reactions, ergotism

Metabolism/Transport Effects**Substrate** of CYP3A4 (major)

Drug Interactions

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Efavirenz: May enhance the adverse/toxic effect of Ergot Derivatives. Specifically, the risk for peripheral vasospasm and ischemia may be increased. *Risk X: Avoid combination*

Macrolide Antibiotics: May enhance the adverse/toxic effect of Ergot Derivatives. Specifically leading the development of ergotism. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Posaconazole: May increase the serum concentration of Ergot Derivatives. *Risk X: Avoid combination*

Protease Inhibitors: May decrease the metabolism of Ergot Derivatives. *Risk X: Avoid combination*

Serotonin 5-HT1D Receptor Agonists: Ergot Derivatives may enhance the vasoconstricting effect of Serotonin 5-HT1D Receptor Agonists. Serotonin 5-HT1D Receptor Agonists may enhance the vasoconstricting effect of Ergot Derivatives. *Risk X: Avoid combination*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Ergot Derivatives. This may cause serotonin syndrome. *Risk X: Avoid combination*

Voriconazole: May increase the serum concentration of Ergot Derivatives. *Risk X: Avoid combination*

Monitoring ParametersBlood pressure, pulse, uterine response; cramping, if severe, may justify a need for dose reduction (oral)

Nursing: Physical Assessment/MonitoringBlood pressure should be monitored, especially with I.V. use. For postpartum use, character and amount of vaginal bleeding should be monitored. Assess therapeutic effectiveness and adverse reactions, including ergotamine toxicity (eg, headache, ringing in ears, nausea and vomiting, diarrhea, numbness or coldness of extremities, confusion, hallucinations, dyspnea, chest pain, convulsions). When used to test for Prinzmetal's angina during coronary arteriography, emergency equipment, including nitroglycerin, must be on hand. When used at any time other than postpartum, determine that patient is not pregnant.

Patient EducationFor angina diagnosis, cardiologist will instruct patient about what to expect. For postpartum hemorrhage (an emergency situation), patient needs to know why the drug is being given and what side effects she might experience (eg, mild nausea and vomiting, dizziness, headache, ringing ears) and be instructed to report respiratory difficulty, acute headache, numbness or cold feeling in extremities, or severe abdominal cramping. **Pregnancy/breast-feeding precautions:** If used for angina diagnosis, inform prescriber if you are pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, as maleate:

Ergotrate®: 0.2 mg/mL (1 mL)

Tablet, as maleate:

Ergotrate®: 0.2 mg

Generic AvailableNo

Mechanism of ActionSimilar smooth muscle actions as seen with ergotamine; however, it affects primarily uterine smooth muscles producing sustained contractions and thereby shortens the third stage of labor.

Pharmacodynamics/Kinetics

Onset of action: I.M.: ~2-5 minutes; Oral: 6-15 minutes

Duration: I.M.: Uterine effect: 3 hours; I.V.: ~45 minutes; Oral: 3 hours

Absorption: Oral: Rapid

Metabolism: Hepatic

Half-life elimination: I.V.: 120 minutes

Excretion: Primarily feces; urine

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause dizziness
Mental Health: Effects on Psychiatric TreatmentNone reported
Cardiovascular ConsiderationsFor variant angina, ergonovine with an intravenous test dose of 50 mcg followed by 0.1-0.4 mg every 5 minutes can be used (Fuster V, 2004).
Index TermsErgometrine Maleate; Ergonovine Maleate

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Cafergot® may be confused with Carafate®

Pronunciation(er GOT a meen & KAF een)

U.S. Brand NamesCafergot®; Migergot

Canadian Brand NamesCafergor®

Pharmacologic CategoryAntimigraine Agent; Ergot Derivative; Stimulant

Use: Labeled IndicationsAbort or prevent vascular headaches, such as migraine, migraine variants, or so-called “histaminic cephalalgia”

Dosing: AdultsMigraine:

Oral: Two tablets at onset of attack; then 1 tablet every 30 minutes as needed; maximum: 6 tablets per attack; do not exceed 10 tablets/week.

Rectal: One suppository rectally at first sign of an attack; follow with second dose after 1 hour, if needed; maximum: 2 per attack; do not exceed 5/week.

Storage

Suppositories: Store below 25°C (77°F) in sealed foil. Protect from moisture.

Tablet: Store at room temperature 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to ergotamine, caffeine, or any component of the formulation; peripheral vascular disease; hepatic or renal disease; coronary artery disease; hypertension; sepsis; ergot alkaloids are contraindicated with strong inhibitors of CYP3A4 (includes protease inhibitors, azole antifungals, and some macrolide antibiotics); pregnancy

Allergy Considerations

- Ergot Alkaloid Allergy

Warnings/Precautions

Boxed warnings:

- CYP3A4 inhibitors: See “Concurrent drug therapy issues” below.

Concerns related to adverse effects:

- Cardiac valvular fibrosis: Ergot alkaloids have been associated with fibrotic valve thickening (eg, aortic, mitral, tricuspid); usually associated with long-term, chronic use.

- Cardiovascular effects: Vasospasm or vasoconstriction can occur, possibly resulting in decreased cerebral blood flow, ECG changes, and hypertension; sustained vasoconstriction may also lead to ischemic colitis, intermittent claudication, aggravation of angina, or precipitation of MI. Do not use is any patient at risk or predisposed to vascular effects of ergot alkaloids.

- Ergotism: Ergot alkaloid use may result in ergotism (intense vasoconstriction) resulting in peripheral vascular ischemia and possible gangrene. Ergotism is usually associated with overdosage or prolonged chronic use; do not exceed dosing guidelines and avoid prolonged administration.

- Pleural/retroperitoneal fibrosis: Rare cases of pleural and/or retroperitoneal fibrosis have been reported with prolonged daily use.

Concurrent drug therapy issues:

- CYP3A4 inhibitors: **[U.S. Boxed Warning]: Ergot alkaloids are contraindicated with potent inhibitors of CYP3A4 (includes protease inhibitors, azole antifungals, and some macrolide antibiotics); concomitant use associated with acute ergot toxicity (ergotism).**

Special populations:

- Elderly: Use with extreme caution or avoid use in the elderly; due to vasoconstrictive properties and cardiovascular adverse effects associated with ergot alkaloids.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Withdrawal: Discontinuation after extended use may result in withdrawal symptoms (eg, rebound headache).

Geriatric ConsiderationsNot recommended for use in the elderly. May be harmful due to reduction in cerebral blood flow. May precipitate angina, myocardial infarction, or aggravate intermittent claudication.

Pregnancy Risk FactorX

Pregnancy ConsiderationsMay cause prolonged constriction of the uterine vessels and/or increased myometrial tone leading to reduced placental blood flow. This has contributed to fetal growth retardation in animals.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsErgotamine is excreted in breast milk and may cause vomiting, diarrhea, weak pulse, and unstable blood pressure in the nursing infant. Consider discontinuing the drug or discontinuing nursing.

Adverse ReactionsFrequency not defined.

Cardiovascular: Absence of pulse, bradycardia, cardiac valvular fibrosis, cyanosis, edema, ECG changes, gangrene, hypertension, ischemia, precordial distress and pain, tachycardia, vasospasm

Central nervous system: Vertigo

Dermatologic: Itching

Gastrointestinal: Anal or rectal ulcer (with overuse of suppository), nausea, vomiting

Genitourinary: Retroperitoneal fibrosis

Neuromuscular & skeletal: Muscle pain, numbness, paresthesia, weakness

Respiratory: Pleuropulmonary fibrosis

Miscellaneous: Cold extremities

Metabolism/Transport Effects

Ergotamine: **Substrate** of CYP3A4 (major); **Inhibits** CYP3A4 (weak)

Caffeine: **Substrate** of CYP1A2 (major), 2C9 (minor), 2D6 (minor), 2E1 (minor), 3A4 (minor); **Inhibits** CYP1A2 (weak), 3A4 (moderate)

Drug Interactions

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Efavirenz: May enhance the adverse/toxic effect of Ergot Derivatives. Specifically, the risk for peripheral vasospasm and ischemia may be increased. *Risk X: Avoid combination*

Eplerenone: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Eplerenone. Management: A lower starting dose of eplerenone (25 mg once daily) is recommended in patients with hypertension who are also taking drugs that are moderate inhibitors of CYP3A4. *Risk D: Consider therapy modification*

FentaNYL: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Macrolide Antibiotics: May enhance the adverse/toxic effect of Ergot Derivatives. Specifically leading the development of ergotism. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Posaconazole: May increase the serum concentration of Ergot Derivatives. *Risk X: Avoid combination*

Protease Inhibitors: May decrease the metabolism of Ergot Derivatives. *Risk X: Avoid combination*

Quinolone Antibiotics: May decrease the metabolism of Caffeine. **Exceptions:** Gatifloxacin; Gemifloxacin; Levofloxacin; Lomefloxacin; Moxifloxacin; Nalidixic Acid; Ofloxacin; Sparfloxacin; Trovafloxacin. *Risk C: Monitor therapy*

Ranolazine: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Ranolazine. Management: Limit the ranolazine dose to a maximum of 500mg twice daily in patients concurrently receiving moderate CYP3A4 inhibitors (e.g., diltiazem, verapamil, erythromycin, etc.). *Risk D: Consider therapy modification*

Regadenoson: Caffeine may diminish the vasodilatory effect of Regadenoson. *Risk D: Consider therapy modification*

Salmeterol: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

Serotonin 5-HT1D Receptor Agonists: Ergot Derivatives may enhance the vasoconstricting effect of Serotonin 5-HT1D Receptor Agonists. Serotonin 5-HT1D Receptor Agonists may enhance the vasoconstricting effect of Ergot Derivatives. *Risk X: Avoid combination*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Ergot Derivatives. This may cause serotonin syndrome. *Risk X: Avoid combination*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Voriconazole: May increase the serum concentration of Ergot Derivatives. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsFood: Avoid tea, cola, and coffee (caffeine may increase GI absorption of ergotamine). Grapefruit juice may cause increased blood levels of ergotamine, leading to increased toxicity.

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking (eg, anything that adds to peripheral vasoconstriction). Assess therapeutic effectiveness and adverse response on a regular basis during therapy. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report. **Pregnancy risk factor X:** Determine that patient is not pregnant before beginning treatment. Do not give to women of childbearing unless woman is capable of complying with appropriate contraceptive measures 1 month prior to therapy, during therapy, and for 1 month following therapy. Instruct patient on appropriate contraceptive measures. Breast-feeding is not recommended.

Patient EducationInform prescriber of all prescriptions, OTC medications, or herbal products you are taking, and any allergies you have. Do not take any new medication during therapy without consulting prescriber. Take this drug as directed; do not increase dose or use more often than prescribed. If relief is not obtained, contact your prescriber. Avoid products that contain caffeine (eg, tea, coffee, colas, cocoa); caffeine increases GI absorption of ergotamines. May cause drowsiness (avoid activities requiring alertness until effects of medication are known); mild nausea or vomiting (consult prescriber for approved antiemetic); or mild weakness or numbness of extremities (avoid activities that may have a potential for injury). Inspect your extremities for coldness, numbness, or injury. Report immediately any extreme numbness, pain, tingling or weakness in extremities (toes, fingers); severe unresolved nausea or vomiting; or respiratory difficulty or irregular heartbeat. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant 1 month before, during, or for 1 month following therapy. Consult prescriber for instruction on appropriate contraceptive measures. This drug may cause severe fetal defects. Do not donate blood during or for 1 month following therapy. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Suppository, rectal:

Migergot: Ergotamine tartrate 2 mg and caffeine 100 mg (12s)

Tablet: Ergotamine tartrate 1 mg and caffeine 100 mg

Cafergot®: Ergotamine tartrate 1 mg and caffeine 100 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Suppository (Migergot)

2-100 mg (12): $72.99

Mechanism of ActionHas partial agonist and/or antagonist activity against tryptaminergic, dopaminergic and alpha-adrenergic receptors depending upon their site; is a highly active uterine stimulant; it causes constriction of peripheral and cranial blood vessels and produces depression of central vasomotor centers

Pharmacodynamics/Kinetics

Absorption: Ergotamine: Oral, rectal: Erratic; enhanced by caffeine coadministration

Metabolism: Extensively hepatic

Time to peak, serum: Ergotamine: 0.5-3 hours

Half-life elimination: 2 hours

Excretion: Feces (90% as metabolites)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness and dizziness are common

Mental Health: Effects on Psychiatric TreatmentUse caution with propranolol; vasoconstriction has been reported; coadministration with strong CYP3A4 inhibitors has been associated with serious adverse events (some weaker inhibitors include nefazodone, fluoxetine and fluvoxamine)

Cardiovascular ConsiderationsThis drug should be used extremely carefully because of its potent vasoconstrictor action. Administration may elicit marked increases in blood pressure and intracranial hemorrhage. Use should be avoided in patients with cardiovascular disease, including hypertension, coronary artery disease and peripheral vascular disease.

Index TermsCaffeine and Ergotamine; Ergotamine Tartrate and Caffeine

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(er GOT a meen)

U.S. Brand NamesErgomar®

Pharmacologic CategoryAntimigraine Agent; Ergot Derivative

Use: Labeled IndicationsAbort or prevent vascular headaches, such as migraine, migraine variants, or so-called “histaminic cephalalgia”

Dosing: AdultsMigraine: Sublingual: One tablet under tongue at first sign, then 1 tablet every 30 minutes if needed; maximum dose: 3 tablets/24 hours, 5 tablets/week

Dosing: ElderlySee Special Geriatric Considerations.

Administration: OralDo not crush sublingual tablets.

StorageStore sublingual tablet at room temperature. Protect from light and heat.

ContraindicationsHypersensitivity to ergotamine or any component of the formulation; peripheral vascular disease; hepatic or renal disease; coronary artery disease; hypertension; sepsis; ergot alkaloids are contraindicated with strong inhibitors of CYP3A4 (includes protease inhibitors, azole antifungals, and some macrolide antibiotics); pregnancy

Allergy Considerations

- Ergot Alkaloid Allergy

Warnings/Precautions

Boxed warnings:

- CYP3A4 inhibitors: See “Concurrent drug therapy issues” below.

Concerns related to adverse effects:

- Cardiac valvular fibrosis: Ergot alkaloids have been associated with fibrotic valve thickening (eg, aortic, mitral, tricuspid); usually associated with long-term, chronic use.
- Cardiovascular effects: Vasospasm or vasoconstriction can occur, possibly resulting in decreased cerebral blood flow, ECG changes, and hypertension; sustained vasoconstriction may also lead to ischemic colitis, intermittent claudication, aggravation of angina, or precipitation of MI. Do not use is any patient at risk or predisposed to vascular effects of ergot alkaloids.
- Ergotism: Ergot alkaloid use may result in ergotism (intense vasoconstriction) resulting in peripheral vascular ischemia and possible gangrene. Ergotism is usually associated with overdosage or prolonged chronic use; do not exceed dosing guidelines and avoid prolonged administration.
- Pleural/retroperitoneal fibrosis: Rare cases of pleural and/or retroperitoneal fibrosis have been reported with prolonged daily use.

Concurrent drug therapy issues:

- CYP3A4 inhibitors: **[U.S. Boxed Warning]: Ergot alkaloids are contraindicated with potent inhibitors of CYP3A4 (includes protease inhibitors, azole antifungals, and some macrolide antibiotics); concomitant use associated with acute ergot toxicity (ergotism).**

Special populations:

- Elderly: Use with extreme caution or avoid use in the elderly; due to vasoconstrictive properties and cardiovascular adverse effects associated with ergot alkaloids.
- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Withdrawal: Discontinuation after extended use may result in withdrawal symptoms (eg, rebound headache).

Geriatric ConsiderationsNot recommended for use in the elderly. May be harmful due to reduction in cerebral blood flow. May precipitate angina, myocardial infarction, or aggravate intermittent claudication.

Pregnancy Risk FactorX

Pregnancy ConsiderationsMay cause prolonged constriction of the uterine vessels and/or increased myometrial tone leading to reduced placental blood flow. This has contributed to fetal growth retardation in animals.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsErgotamine is excreted in breast milk and may cause vomiting, diarrhea, weak pulse, and unstable blood pressure in the nursing infant. Consider discontinuing the drug or discontinuing nursing.

Adverse ReactionsFrequency not defined.

Cardiovascular: Absence of pulse, bradycardia, cardiac valvular fibrosis, cyanosis, edema, ECG changes, gangrene, hypertension, ischemia, precordial distress and pain, tachycardia, vasospasm

Central nervous system: Vertigo

Dermatologic: Itching

Gastrointestinal: Nausea, vomiting

Genitourinary: Retroperitoneal fibrosis

Neuromuscular & skeletal: Muscle pain, numbness, paresthesia, weakness

Respiratory: Pleuropulmonary fibrosis

Miscellaneous: Cold extremities

Metabolism/Transport Effects**Substrate** of CYP3A4 (major); Inhibits CYP3A4 (weak)
Drug Interactions

Assess therapeutic effectiveness and adverse response on a regular basis during therapy. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report. Abrupt discontinuation after long-term use may result in withdrawal symptoms (eg, rebound headache). **Pregnancy risk factor X:** Determine that patient is not pregnant before beginning treatment. Do not give to women of childbearing unless woman is capable of complying with contraceptive measures 1 month prior to therapy, during therapy, and for 1 month following therapy. Instruct patient on appropriate contraceptive measures. Breast-feeding is not recommended.
Patient EducationDo not take any new medication during therapy without consulting prescriber. Take this drug as directed; do not increase dose or use more often than prescribed. If relief is not obtained, contact your prescriber. Avoid products that contain caffeine (eg, tea, coffee, colas, cocoa); caffeine increases GI absorption of ergotamines. May cause drowsiness (avoid activities requiring alertness until effects of medication are known); mild nausea or vomiting (consult prescriber for approved antiemetic); or mild weakness or numbness of extremities (avoid activities that may have a potential for injury). Inspect your extremities for coldness, numbness, or injury. Report immediately any extreme numbness, pain, tingling or weakness in extremities (toes, fingers); severe unresolved nausea or vomiting; or respiratory difficulty or irregular heartbeat. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant 1 month before, during, or for 1 month following therapy. Consult prescriber for instruction on appropriate contraceptive measures. This drug may cause severe fetal defects. Do not donate blood during or for 1 month following therapy. Breast-feeding is not recommended.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, sublingual, as tartrate:

Ergomar®: 2 mg [peppermint flavor]

Generic AvailableNo
Mechanism of ActionHas partial agonist and/or antagonist activity against tryptaminergic, dopaminergic and alpha-adrenergic receptors depending upon their site; is a highly active uterine stimulant; it causes constriction of peripheral and cranial blood vessels and produces depression of central vasomotor centers
Pharmacodynamics/Kinetics

Absorption: Oral: Erratic; enhanced by caffeine coadministration

Metabolism: Extensively hepatic

Time to peak, serum: 0.5-3 hours

Half-life elimination: 2 hours

Excretion: Feces (90% as metabolites)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness and dizziness are common

Mental Health: Effects on Psychiatric TreatmentUse caution with propranolol; vasoconstriction has been reported; coadministration with strong CYP3A4 inhibitors has been associated with serious adverse events (some weaker inhibitors include nefazodone, fluoxetine and fluvoxamine)

Cardiovascular ConsiderationsThis drug should be used extremely carefully because of its potent vasoconstrictor action. Administration may elicit marked increases in blood pressure and intracranial hemorrhage. Use should be avoided in patients with cardiovascular disease, including hypertension, coronary artery disease and peripheral vascular disease.

Index TermsErgotamine Tartrate

Special Alerts

Erlotinib: Health Canada Issues Warning Concerning Hepatoxicity - December, 2008

Hoffmann-La Roche Limited, in conjunction with Health Canada, has issued a “Dear Healthcare Professional” letter regarding important safety information concerning erlotinib (Tarceva®) use in patients with hepatic impairment. The warning is similar to that released previously by the U.S. Food and Drug Administration (FDA). Further information may be found at:

Canada: http://www.hc-sc.gc.ca/dhp-mps/medeff/advisories-avis/prof/_2008/tarceva_hpc-cps-eng.php

U.S.: http://www.fda.gov/medwatch/safety/2008/safety08.htm#Tarceva

Erlotinib: Reports of Hepatic Failure and Hepatorenal Syndrome - September 2008

OSI Pharmaceuticals, Inc and Genetech, Inc, in conjunction with the U.S. Food and Drug Administration (FDA), have issued a “Dear Healthcare Professional” letter regarding erlotinib (Tarceva®) use in patients with hepatic impairment. Cases of hepatic failure and hepatorenal syndrome (including fatalities) have been reported, particularly in patients with baseline hepatic impairment. Closely monitor all patients with hepatic impairment (total bilirubin greater than upper limit of normal [ULN] or any Child-Pugh class) receiving erlotinib, especially those with total bilirubin >3 times ULN. Dosage modifications (therapy interruption or discontinuation) may be necessary for severe changes in liver function. The FDA-approved labeling has been updated to include related changes to warnings and dosage modifications for hepatic disease.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Tarceva

Medication Safety Issues

Sound-alike/look-alike issues:

Erlotinib may be confused with gefitinib

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(er LOE tye nib)

U.S. Brand NamesTarceva®

Canadian Brand NamesTarceva®

Pharmacologic CategoryAntineoplastic Agent, Tyrosine Kinase Inhibitor; Epidermal Growth Factor Receptor (EGFR) Inhibitor

Use: Labeled IndicationsTreatment of locally advanced or metastatic nonsmall cell lung cancer (NSCLC) as monotherapy; locally advanced, unresectable or metastatic pancreatic cancer (first-line therapy in combination with gemcitabine)

Dosing: Adults**Note:** Dose adjustments are likely to be needed when erlotinib is administered concomitantly with strong CYP3A4 inducers or inhibitors.

NSCLC: 150 mg once daily

Pancreatic cancer: 100 mg once daily in combination with gemcitabine

Dosage adjustment for concomitant CYP3A4 inhibitors/inducers:

CYP3A4 inhibitors: Dose reductions are more likely to be needed for severe adverse reactions when erlotinib is administered concomitantly with strong CYP3A4 inhibitors (eg, azole antifungals, clarithromycin, erythromycin, nefazodone, protease inhibitors, telithromycin). Dose reduction (if required) should be done in decrements of 50 mg.

CYP3A4 inducers: Concomitant administration with CYP3A4 inducers (eg, carbamazepine, phenobarbital, phenytoin, rifamycins, and St John’s wort) may require increased doses (increase as tolerated at 2-week intervals); doses >150 mg/day should be considered with rifampin; alternatives to the enzyme-inducing agent should be utilized first.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentInterrupt treatment for renal disease due to dehydration; may resume after euvolemia re-established.

Dosing: Hepatic Impairment

The manufacturer recommends the following guidelines:

Patients with normal hepatic function at baseline: Total bilirubin >3 times ULN and/or transaminases >5 times ULN: Interrupt or discontinue treatment

Patients with baseline hepatic impairment:

Total bilirubin >3 times ULN: Use extreme caution

Worsening liver function (not yet severe): Interrupt treatment and/or reduce dose

Severe changes in liver function (eg, doubling of total bilirubin and/or tripling of transaminases): Interrupt or discontinue treatment

A reduced starting dose (75 mg once daily) has been recommended in patients with hepatic dysfunction (AST ≥3 times ULN or direct bilirubin 1-7 mg/dL), with individualized dosage escalation if tolerated (Miller, 2007).

Dosing: Adjustment for ToxicityDose reductions should be made in 50 mg decrements.

Diarrhea: Manage with loperamide; Severe diarrhea: Reduce dose or temporarily interrupt treatment

Pulmonary symptoms: Acute onset (or worsening) of pulmonary symptoms (eg, dyspnea, cough, fever): Interrupt treatment and evaluate for drug-induced interstitial lung disease; discontinue permanently with development of interstitial lung disease

Severe skin reaction: Reduce dose or temporarily interrupt treatment

Dosing: Combination Regimens

Pancreatic cancer: Gemcitabine-Erlotinib

Administration: OralThe manufacturer recommends administration on an empty stomach (at least 1 hour before or 2 hours after the ingestion of food) even though this reduces drug absorption by approximately 40%. Administration after a meal results in nearly 100% absorption.

Dietary ConsiderationsTake this medicine an empty stomach, 1 hour before or 2 hours after a meal. Avoid grapefruit juice.

StorageStore at room temperature of 25°C (77°F); excursions permitted to 15°C and 30°C (59°F and 86°F).

ContraindicationsThere are no contraindications listed within the manufacturer’s labeling.

Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Cardiovascular events: Cerebrovascular accidents, MI, and myocardial ischemia have been reported; use with caution in patients with cardiovascular disease.

- Hematologic effects: Microangiopathic hemolytic anemia (MAHA) with thrombocytopenia has been reported (rarely) with erlotinib in combination with gemcitabine.

- Pulmonary toxicity: Rare, sometimes fatal, pulmonary toxicity (interstitial pneumonia, interstitial lung disease [ILD], obliterative bronchiolitis, pulmonary fibrosis) has occurred; symptoms may begin within 5 days to more than 9 months after treatment initiation. Interrupt therapy for unexplained pulmonary symptoms (dyspnea, cough, and fever); discontinue for confirmed ILD.

- Skin reaction: Generalized or severe acneiform, erythematous or maculopapular rash may occur. Skin rash may correlate with treatment response and prolonged survival (Saif, 2008). Management should include alcohol-free lotions, topical antibiotics or topical corticosteroids, or if necessary, oral antibiotics and systemic corticosteroids; avoid sunlight. Severe skin reactions may require dosage modification.

Disease-related concerns:

- Hepatic impairment: Liver enzyme elevations have been reported. Hepatic failure and hepatorenal syndrome have also been reported, particularly in patients with baseline hepatic impairment. Monitor patients with any hepatic impairment (total bilirubin >ULN; Child-Pugh class A, B, or C) closely, including those with hepatic disease due to tumor burden. Use with extreme caution in patients with total bilirubin >3 times ULN. Dosage reduction, interruption or discontinuation may be recommended for changes in hepatic function.

- Renal impairment: Acute renal failure, renal insufficiency, and hepatorenal syndrome have been reported; use with caution in patients with or at risk for renal impairment. Monitor closely for dehydration.

Concurrent drug therapy issues:

- Anticoagulants: Use caution with concomitant anticoagulant therapy; elevated INR and bleeding events have been reported.

- Gemcitabine: MI, CVA, and microangiopathic hemolytic anemia with thrombocytopenia have been noted in patients receiving concomitant erlotinib and gemcitabine.

- High potential for interactions: Concurrent use with CYP3A4 inhibitors and moderate or strong CYP3A4 inducers may affect erlotinib levels. Consider alternative agents to CYP3A4 inducers to avoid the potential for CYP-mediated interactions; use with caution in patients taking strong CYP3A4 inhibitors.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

- Smokers: Erlotinib levels may be lower in patients who smoke; advise patients to stop smoking.

Geriatric ConsiderationsIn clinical trials, there was no significant difference between older and younger adults in survival benefit, safety, or pharmacokinetics. No dosage adjustment necessary in elderly patients.

Pregnancy Risk FactorD

Pregnancy ConsiderationsAnimal studies have demonstrated fetal harm and abortion. There are no well-controlled studies in pregnant women. Women of childbearing potential should be advised to avoid pregnancy; adequate contraception is recommended during treatment and for 2 weeks after treatment has been completed.

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions

Adverse reactions reported with monotherapy:

>10%:

Central nervous system: Fatigue (52% to 79%)

Dermatologic: Rash (75% to 76%; grade 3: 8%; grade 4: <1%; median onset: 8 days), pruritus (13%), dry skin (12%)

Gastrointestinal: Diarrhea (54% to 55%; grade 3: 6%; grade 4: <1%; median onset: 12 days), anorexia (52% to 69%), nausea (33% to 40%), vomiting (23% to 25%), stomatitis (17% to 19%), abdominal pain (11%)

Ocular: Conjunctivitis (12%), keratoconjunctivitis sicca (12%)

Respiratory: Dyspnea (41%), cough (33%)

Miscellaneous: Infection (24% to 34%)

1% to 10%:

Hepatic: ALT increased (grade 2: 4%)

Respiratory: Pneumonitis/pulmonary infiltrate (3%), pulmonary fibrosis (3%)

Significant adverse reactions reported with combination (erlotinib plus gemcitabine) therapy:

Cardiovascular: Deep venous thrombosis (4%), cerebrovascular accident (2%; including cerebral hemorrhage), MI/myocardial ischemia (2%), arrhythmia, syncope

Central nervous system: Fever (36%), depression (19%), headache (15%)

Dermatologic: Rash (69%)

Gastrointestinal: Diarrhea (48%), weight loss (39%), stomatitis (22%), ileus, pancreatitis

Hematologic: Hemolytic anemia, microangiopathic hemolytic anemia with thrombocytopenia (1%)

Hepatic: ALT increased (grade 2: 31%, grade 3: 13%, grade 4: <1%), AST increased (grade 2: 24%, grade 3: 10%, grade 4 <1%), hyperbilirubinemia (grade 2: 17%, grade 3: 10%, grade 4: <1%)

Renal: Renal insufficiency

Respiratory: Dyspnea (24%), cough (16%), ILD-like events (3%)

Miscellaneous: Infection (39%)

Mono- or combination therapy: <1%, postmarketing, and/or case reports: Acute renal failure, bronchiolitis, corneal ulcerations, episcleritis, epistaxis, gastritis, gastroduodenal ulcers, gastrointestinal bleeding, gastrointestinal hemorrhage, hair/nail disorders (alopecia, brittle/loose nails, eyelash/brow changes, hirsutism, paronychia), hearing loss, hematemesis, hematochezia, hepatic failure, hepatorenal syndrome, hepatotoxicity, interstitial lung disease, melena, peptic ulcer bleeding, pulmonary fibrosis, pulmonary infiltrates, rash (acneiform; sparing prior radiation field), tympanic membrane perforation

Oncology: Emetic PotentialVery low (<10%)

Metabolism/Transport EffectsSubstrate of CYP1A2 (minor), 3A4 (major)

Drug Interactions

Antacids: May decrease the serum concentration of Erlotinib. Management: Separate the administration of erlotinib and any antacid by several hours in order to minimize the risk of a significant interaction. *Risk D: Consider therapy modification*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Erlotinib. *Risk C: Monitor therapy*

Cardiac Glycosides: Antineoplastic Agents may decrease the absorption of Cardiac Glycosides. This may only affect digoxin tablets. **Exceptions:** Digitoxin. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

H2-Antagonists: May decrease the serum concentration of Erlotinib. *Risk X: Avoid combination*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Proton Pump Inhibitors: May decrease the serum concentration of Erlotinib. *Risk X: Avoid combination*

Rifampin: May increase the metabolism of Erlotinib. *Risk D: Consider therapy modification*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Vitamin K Antagonists (eg, warfarin): Antineoplastic Agents may enhance the anticoagulant effect of Vitamin K Antagonists. Antineoplastic Agents may diminish the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Erlotinib bioavailability is increased with food. Avoid grapefruit or grapefruit juice (may decrease the metabolism and increase erlotinib levels). Avoid grapefruit juice.

Herb/Nutraceutical: Avoid St John's wort (may increase metabolism and decrease erlotinib concentrations).

Monitoring ParametersPeriodic liver function tests (transaminases, bilirubin, and alkaline phosphatase); periodic renal function tests and serum electrolytes (in patients at risk for dehydration); hydration status

Nursing: Physical Assessment/MonitoringEvaluate hepatic and renal status prior to beginning therapy. Assess potential for interactions or toxicity with other pharmacological agents or herbal products patient may be taking (especially CYP3A4 inhibitors or inducers); dose adjustments may be necessary. Assess laboratory test results, therapeutic response, and adverse reactions (eg, pulmonary toxicity, poorly tolerated diarrhea, severe skin reactions). Teach patient possible side effects, appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsPeriodic liver function tests (transaminases, bilirubin, and alkaline phosphatase); renal function, electrolytes (in patients at risk for dehydration)

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy without consulting prescriber. Take exactly as directed; 1 hour before or 2 hours after food. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake, and adequate nutrition (small frequent meals may help). May cause fatigue (regular, adequate rest periods may help reduce fatigue); rash or dry skin (use nonirritating skin lotion that does not contain alcohol or other irritants); loss of hair (may grow back when treatment is completed); nausea or anorexia (small frequent meals, good mouth care, or sucking lozenges may help); diarrhea (boiled milk, yogurt). Report any persistent gastrointestinal changes (including diarrhea, abdominal pain, nausea, or vomiting); conjunctivitis or visual changes; any difficulty breathing, unusual cough or fever; signs of infection; or other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant while taking this medication or for two weeks after discontinuing. This drug may cause fetal deformities or loss of pregnancy; see prescriber for appropriate contraceptives. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Tarceva®: 25 mg, 100 mg, 150 mg

Generic AvailableNo

ManufacturerOSI Inc and Genetech Inc

Pricing: U.S. (www.drugstore.com)

Tablets (Tarceva)

25 mg (30): $1279.77

100 mg (30): $3487.86

150 mg (30): $3965.25

Mechanism of ActionThe mechanism of erlotinib's antitumor action is not fully characterized. The drug is known to inhibit overall epidermal growth factor receptor (HER1/EGFR)- tyrosine kinase. Active competitive inhibition of adenosine triphosphate inhibits downstream signal transduction of ligand dependent HER1/EGFR activation.

Pharmacodynamics/Kinetics

Absorption: Oral: 60% on an empty stomach; almost 100% on a full stomach

Distribution: 94-232 L

Protein binding: 92% to 95% to albumin and α_1-acid glycoprotein

Metabolism: Hepatic, via CYP3A4 (major), CYP1A1 (minor), CYP1A2 (minor), and CYP1C (minor)

Bioavailability: Almost 100% when given with food; 60% without food

Half-life elimination: 24-36 hours

Time to peak, plasma: 1-7 hours

Excretion: Primarily as metabolites: Feces (83%; 1% as unchanged drug); urine (8%)

Pharmacotherapy Pearls **Oncology Comment:** According to the National Comprehensive Cancer Network (NCCN) pancreatic adenocarcinoma guidelines, gemcitabine combination therapy (including gemcitabine plus erlotinib) is an option for patients with good performance status in the treatment of locally-advanced or metastatic pancreatic cancer.

The NCCN guidelines for NSCLC recommend erlotinib as single agent treatment for disease progression after failure of first- or second-line treatment in patients with a performance status of 0-2. Erlotinib may be considered for patients with a performance status of 3. Erlotinib is considered a first-line therapy (alone or in combination with chemotherapy) in patients with advanced or metastatic NSCLC who have never smoked and have known active EGFR mutation or gene amplification.

Factors (in patients with NSCLC) which correlate positively with response to EGFR-tyrosine kinase inhibitor (TKI) therapy include skin rash (due to EGFR-TKI therapy), patients who have never smoked, EGFR mutation, and patients of Asian origin. KRAS mutation correlated with poorer outcome with EGFR-TKI therapy in patients with NSCLC. (Cooley, 2008; Jackman, 2008; Masarelli, 2007; Shepherd, 2005)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation), mucositis, abnormal taste, and stomatitis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusSedation is common

Mental Health: Effects on Psychiatric TreatmentGI side effects and sedation are common. Concomitant use with lithium, SSRIs, or valproic acid may produce additive effects. Concomitant use with psychotropic agents may produce additive sedative effects; monitor. Carbamazepine, phenobarbital, phenytoin, and St John's wort may decrease the effects of erlotinib; monitor. Nefazodone may increase the effects of erlotinib secondary to enzyme inhibition; monitor.

Pharmacologic CategoryAntibiotic, Carbapenem

Use: Labeled IndicationsTreatment of the following moderate-severe infections: Complicated intra-abdominal infections, complicated skin and skin structure infections (including diabetic foot infections without osteomyelitis), complicated UTI (including pyelonephritis), acute pelvic infections (including postpartum endomyometritis, septic abortion, post surgical gynecologic infections), and community-acquired pneumonia. Prophylaxis of surgical site infection following elective colorectal surgery. Antibacterial coverage includes aerobic gram-positive organisms, aerobic gram-negative organisms, anaerobic organisms.

Note: Methicillin-resistant *Staphylococcus*, *Enterococcus* spp, penicillin-resistant strains of *Streptococcus pneumoniae*, beta-lactamase-positive strains of *Haemophilus influenzae* are **resistant** to ertapenem, as are most *Pseudomonas aeruginosa*.

Dosing: Adults**Note:** I.V. therapy may be administered for up to 14 days; I.M. for up to 7 days

Community-acquired pneumonia and complicated urinary tract infections (including pyelonephritis): I.M., I.V.: 1 g/day; duration of total antibiotic treatment: 10-14 days (**Note:** Duration includes possible switch to appropriate oral therapy after at least 3 days of parenteral treatment, once clinical improvement demonstrated.)

Intra-abdominal infection: I.M., I.V.: 1 g/day for 5-14 days

Pelvic infections (acute): I.M., I.V.: 1 g/day for 3-10 days

Prophylaxis of surgical site following colorectal surgery: 1 g given 1 hour preoperatively

Skin and skin structure infections (including diabetic foot infections): I.M., I.V.: 1 g/day for 7-14 days

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** I.V. therapy may be administered for up to 14 days; I.M. therapy for up to 7 days

Children 3 months to 12 years:

Community-acquired pneumonia and complicated urinary tract infections (including pyelonephritis): I.M., I.V.: 15 mg/kg twice daily (maximum: 1 g/day); duration of total antibiotic treatment: 10-14 days (**Note:** Duration includes possible switch to appropriate oral therapy after at least 3 days of parenteral treatment, once clinical improvement demonstrated.)

Intra-abdominal infection: I.M., I.V.: 15 mg/kg twice daily (maximum: 1 g/day) for 5-14 days

Pelvic infections (acute): I.M., I.V.: 15 mg/kg twice daily (maximum: 1 g/day) for 3-10 days

Skin and skin structure infections: I.M., I.V.: 15 mg/kg twice daily (maximum: 1 g/day) for 7-14 days

Children ≥13 years: Refer to adult dosing.

Dosing: Renal Impairment

Children: No data available for pediatric patients with renal insufficiency.

Adults:

Cl_{cr} >30 mL/minute/1.73 m^2: No adjustment required

Cl_{cr} ≤30 mL/minute/1.73 m^2 and ESRD: 500 mg/day

Hemodialysis: When the daily dose is given within 6 hours prior to hemodialysis, a supplementary dose of 150 mg is required following hemodialysis.

Dosing: Hepatic ImpairmentAdjustments cannot be recommended (lack of experience and research in this patient population).

Calculations

- Creatinine Clearance: Adults

Administration: I.M.Avoid injection into a blood vessel. Make sure patient does not have an allergy to lidocaine or another anesthetic of the amide type. Administer by deep I.M. injection into a large muscle mass (eg, gluteal muscle or lateral part of the thigh). Do not administer I.M. preparation or drug reconstituted for I.M. administration intravenously.

Administration: I.V.Infuse over 30 minutes

Administration: I.V. DetailpH 7.5

Dietary ConsiderationsSodium content: 137 mg (~6 mEq) per gram of ertapenem

StorageBefore reconstitution store at ≤25°C (77°F).

I.M.: Use within 1 hour after preparation.

I.V.: Reconstituted I.V. solution may be stored at room temperature and must be used within 6 hours **or** refrigerated, stored for up to 24 hours and used within 4 hours after removal from refrigerator. Do not freeze.

Reconstitution

I.M.: Reconstitute 1 g vial with 3.2 mL of 1% lidocaine HCl injection (without epinephrine). Shake well.

I.V.: Reconstitute 1 g vial with 10 mL of water for injection, 0.9% sodium chloride injection, or bacteriostatic water for injection. Shake well. For adults, transfer dose to 50 mL of 0.9% sodium chloride injection; for children, dilute dose with NS to a final concentration ≤20 mg/mL.

CompatibilityDo not mix with other medications or use diluents containing dextrose.

Y-site: Compatible: Dextran 40, dextran 70, heparin, hetastarch in NS, potassium chloride

ContraindicationsHypersensitivity to ertapenem, other carbapenems, or any component of the formulation; anaphylactic reactions to beta-lactam antibiotics. If using intramuscularly, known hypersensitivity to local anesthetics of the amide type (lidocaine is the diluent).

Allergy Considerations

- Carbapenem Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis/hypersensitivity reactions: Serious hypersensitivity reactions, including anaphylaxis, have been reported (some without a history of previous allergic reactions to beta-lactams).
- CNS effects: Has been associated with CNS adverse effects, including confusional states and seizures; use caution with CNS disorders (eg, brain lesions, history of seizures, or renal impairment).
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment required in patients with moderate-to-severe renal dysfunction. Increased seizure risk has been reported in patients with renal dysfunction.

Concurrent drug therapy issues:

- Valproic acid: Serum concentrations may be reduced to subtherapeutic levels with concomitant use; monitor frequently.

Special populations:

- Elderly: Lower doses (based upon renal function) are often required in the elderly.
- Pediatrics: Safety and efficacy have not been established in children <3 months of age.

Other warnings/precautions:

- I.M. administration: Doses for I.M. administration are mixed with lidocaine; consult Lidocaine information for associated Warnings/Precautions.

Geriatric ConsiderationsAccording to the package insert, the total and unbound AUCs were increased 37% and 67%, respectively, in healthy men and women ≥65 years of age compared to younger adults. No dose adjustment is required for patients with normal age-adjusted renal function.

Pregnancy Risk FactorB

Pregnancy ConsiderationsWith the exception of slightly decreased fetal weights in mice, teratogenic effects and fetal harm have not been shown in animal studies. Adequate and well-controlled studies have not been conducted in pregnant women and it is not known whether ertapenem can cause fetal harm.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsErtapenem is excreted in breast milk. The low concentrations in milk and low oral bioavailability suggest minimal exposure risk to the infant. Although the manufacturer recommends that caution be exercised when administering ertapenem to nursing women, most penicillins and carbapenems are safe for use in breast-feeding. Nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- Ertapenem in Pregnancy & Lactation

Adverse Reactions **Note:** Percentages reported in adults.

1% to 10%:

Cardiovascular: Swelling/edema (3%), chest pain (1% to 2%), hypertension (1% to 2%), hypotension (1% to 2%), tachycardia (1% to 2%)

Central nervous system: Headache (6% to 7%), altered mental status (eg, agitation, confusion, disorientation, decreased mental acuity, changed mental status, somnolence, stupor) (3% to 5%), fever (2% to 5%), insomnia (3%), dizziness (2%), fatigue (1%), anxiety (1%)

Dermatologic: Rash (2% to 3%), pruritus (1% to 2%), erythema (1% to 2%)

Endocrine & metabolic: Hypokalemia (2%), hyperglycemia (1% to 2%), hyperkalemia (≤1%)

Gastrointestinal: Diarrhea (9% to 10%), nausea (6% to 9%), abdominal pain (4%), vomiting (4%), constipation (3% to 4%), acid regurgitation (1% to 2%), dyspepsia (1%), oral candidiasis (≤1%)

Genitourinary: Urine WBCs increased (2% to 3%), urine RBCs increased (1% to 3%), vaginitis (1% to 3%)

Hematologic: Platelet count increased (3% to 7%), hematocrit/hemoglobin decreased (3% to 5%), eosinophils increased (1% to 2%), leukopenia (1% to 2%), neutrophils decreased (1% to 2%), platelet count decreased (1%), prothrombin time increased (<1%)

Hepatic: Hepatic enzyme increased (5% to 9%), alkaline phosphatase increase (3% to 7%), albumin decreased (1% to 2%), bilirubin (total) increased (1% to 2%)

Local: Infused vein complications (5% to 7%), phlebitis/thrombophlebitis (2%), extravasation (1% to 2%)

Neuromuscular & skeletal: Leg pain (≤1%), weakness (1%)

Renal: Serum creatinine increased (1%)

Respiratory: Dyspnea (1% to 3%), cough (1% to 2%), pharyngitis (1%), rales/rhonchi (1%), respiratory distress (≤1%)

<1%, postmarketing, and/or case reports: Abdominal distention, aggressive behavior, anaphylactoid reactions, anaphylaxis, anorexia, arrhythmia, asthma, asystole, atrial fibrillation, bicarbonate (serum) decreased, bilirubin (direct and indirect) increased, bladder dysfunction, bradycardia, bronchoconstriction, BUN increased, *C. difficile*-associated diarrhea, candidiasis, cardiac arrest, chills, cholelithiasis, dehydration, depression, dermatitis, desquamation, diaphoresis, duodenitis, dysphagia, epistaxis, epithelial (urine) cells increased, esophagitis, facial edema, flank pain, flatulence, flushing, gastritis, gastrointestinal hemorrhage, gout, hallucinations, heart failure, heart murmur, hematoma, hematuria, hemoptysis, hemorrhoids, hiccups, hypoesthesia, hypoxemia, ileus, injection site induration, injection site pain, jaundice, malaise, monocytes increased, mouth ulcer, muscle spasm, necrosis, nervousness, oliguria/anuria, pain, pancreatitis, paresthesia, pharyngeal discomfort, pleural effusion, pleuritic pain, pseudomembranous colitis, PTT increased, pyloric stenosis, renal insufficiency, seizure (0.5%), septicemia, septic shock, sodium (serum) increased, spasm, stomatitis, subdural hemorrhage, syncope, taste perversion, tremor, urinary retention, urticaria, vaginal candidiasis, vaginal pruritus, ventricular tachycardia, vertigo, voice disturbance, vulvovaginitis, weight loss

Drug Interactions

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Carbapenems. Management: Avoid concomitant use of doripenem and probenecid. *Risk C: Monitor therapy*

Valproic Acid: Carbapenems may decrease the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Monitoring Parameters Periodic renal, hepatic, and hematopoietic assessment during prolonged therapy; neurological assessment

Nursing: Physical Assessment/Monitoring Assess results of culture and sensitivity tests and patient history of previous allergies or adverse drug reactions. Use caution in presence of impaired renal function; CNS disorder. Patient must be monitored closely for adverse reactions, especially CNS adverse effects (history of seizures, head injuries, or other CNS events increases risk). Teach patient interventions to reduce side effects and adverse symptoms to report.

Patient Education This medication can only be administered intravenously or by intramuscular injections; report warmth, swelling, irritation at infusion or injection site. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake, and nutrition. Report unresolved nausea or vomiting (small, frequent meals, frequent mouth care, and sucking hard candy may help). Report immediately any CNS changes (eg, dizziness, disorientation, visual disturbances, headaches, confusion, or seizures). Report prolonged GI effects, persistent diarrhea, vomiting, abdominal pain; change in respirations or respiratory difficulty; chest pain or palpitations; skin rash; foul-smelling vaginal discharge; or white plaques in mouth. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Invanz®: 1 g [contains sodium 137 mg/g (~6 mEq/g)]

Generic Available No

Manufacturer Merck & Co

Mechanism of Action Inhibits bacterial cell wall synthesis by binding to one or more of the penicillin binding proteins; which in turn inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell walls, thus inhibiting cell wall biosynthesis. Bacteria eventually lyse due to ongoing activity of cell wall autolytic enzymes (autolysins and murein hydrolases) while cell wall assembly is arrested.

Pharmacodynamics/Kinetics

Absorption: I.M.: Almost complete

Distribution: V_{dss}:

Children 3 months to 12 years: ~0.2 L/kg

Children 13-17 years: ~0.16 L/kg

Adults: ~0.12 L/kg

Protein binding (concentration dependent, primarily to albumin): 85% at 300 mcg/mL, 95% at <100 mcg/mL

Metabolism: Non-CYP-mediated hydrolysis to inactive metabolite

Bioavailability: I.M.: ~90%

Half-life elimination:

Children 3 months to 12 years: ~2.5 hours

Children ≥13 years and Adults: ~4 hours

Time to peak: I.M.: ~2.3 hours

Excretion: Urine (~80% as unchanged drug and metabolite); feces (~10%)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Oral candidiasis

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause agitation, confusion, disorientation, decreased mental acuity, sedation, stupor, insomnia, dizziness, or anxiety

Mental Health: Effects on Psychiatric TreatmentNausea and diarrhea are common; use caution with lithium, valproic acid, and SSRIs. May increase hepatic enzymes; use caution with olanzapine and valproic acid.

Index TermsErtapenem Sodium; L-749,345; MK0826

Pharmacologic CategoryAcne Products; Topical Skin Product, Acne
Use: Labeled IndicationsTopical control of acne vulgaris
Dosing: AdultsAcne: Topical: Apply twice daily, morning and evening.
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricAdolescents ≥12 years: Refer to adult dosing.
Allergy Considerations

- Macrolide Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Bleaching effects: May bleach hair or colored fabric.
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment. Stop the drug if significant diarrhea occurs.

Concurrent drug therapy issues:

- Topical acne products: Use concomitant topical acne therapy with caution; cumulative irritancy may occur.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Other warnings/precautions:

- Appropriate use: For external use only; avoid contact with mucous membranes and eyes.

Also see Erythromycin monograph.

Pregnancy Risk FactorC
LactationExcretion in breast milk unknown/use caution
Metabolism/Transport EffectsErythromycin: **Substrate** of CYP2B6 (minor), 3A4 (major); **Inhibits** CYP1A2 (weak), 3A4 (moderate)
Drug Interactions

Alfentanil: Macrolide Antibiotics may decrease the metabolism of Alfentanil. *Risk D: Consider therapy modification*

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): Macrolide Antibiotics may decrease the metabolism of Antifungal Agents (Azole Derivatives, Systemic). Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Macrolide Antibiotics. *Risk D: Consider therapy modification*

Benzodiazepines (metabolized by oxidation): Macrolide Antibiotics may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

BusPIRone: Macrolide Antibiotics may decrease the metabolism of BusPIRone. *Risk D: Consider therapy modification*

Calcium Channel Blockers: Macrolide Antibiotics may decrease the metabolism of Calcium Channel Blockers. **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

CarBAMazepine: Macrolide Antibiotics may decrease the metabolism of CarBAMazepine. *Risk D: Consider therapy modification*

Cardiac Glycosides: Macrolide Antibiotics may increase the serum concentration of Cardiac Glycosides. *Risk D: Consider therapy modification*

Cilostazol: Macrolide Antibiotics may decrease the metabolism of Cilostazol. *Risk D: Consider therapy modification*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Cisapride: Macrolide Antibiotics may decrease the metabolism of Cisapride. *Risk X: Avoid combination*

Clopidogrel: Macrolide Antibiotics may diminish the therapeutic effect of Clopidogrel. *Risk C: Monitor therapy*

Clozapine: Macrolide Antibiotics may decrease the metabolism of Clozapine. *Risk D: Consider therapy modification*

Colchicine: Macrolide Antibiotics may decrease the metabolism of Colchicine. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Macrolide Antibiotics may decrease the metabolism of Corticosteroids (Systemic). *Risk D: Consider therapy modification*

CycloSPORINE: Macrolide Antibiotics may decrease the metabolism of CycloSPORINE. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dabigatran Etexilate: P-Glycoprotein Inhibitors may increase the serum concentration of Dabigatran Etexilate. *Risk X: Avoid combination*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Disopyramide: Macrolide Antibiotics may enhance the QTc-prolonging effect of Disopyramide. Macrolide Antibiotics may decrease the metabolism of Disopyramide. *Risk X: Avoid combination*

Eletriptan: Macrolide Antibiotics may decrease the metabolism of Eletriptan. *Risk D: Consider therapy modification*

Eplerenone: Macrolide Antibiotics may decrease the metabolism of Eplerenone. *Risk C: Monitor therapy*

Ergot Derivatives: Macrolide Antibiotics may enhance the adverse/toxic effect of Ergot Derivatives. Specifically leading the development of ergotism. **Exceptions:** Cabergoline. *Risk D: Consider therapy modification*

Etravirine: May decrease the serum concentration of Macrolide Antibiotics. Clarithromycin AUC is reduced and levels of the active metabolite (14-hydroxy-clarithromycin) are modestly increased. Management: For the treatment of *Mycobacterium avium* complex, consider changing to alternative agent, such as azithromycin. *Risk D: Consider therapy modification*

FentaNYL: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Fexofenadine: Erythromycin may increase the serum concentration of Fexofenadine. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

HMG-CoA Reductase Inhibitors: Macrolide Antibiotics may decrease the metabolism of HMG-CoA Reductase Inhibitors. **Exceptions:** Fluvastatin; Pravastatin; Rosuvastatin. *Risk D: Consider therapy modification*

Lincosamide Antibiotics: May diminish the therapeutic effect of Erythromycin. *Risk X: Avoid combination*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inhibitors may increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phosphodiesterase 5 Inhibitors: Macrolide Antibiotics may decrease the metabolism of Phosphodiesterase 5 Inhibitors. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Pimozide: Macrolide Antibiotics may decrease the metabolism of Pimozide. QTc prolongation is a risk. *Risk X: Avoid combination*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

QuiNIDine: Macrolide Antibiotics may decrease the metabolism of QuiNIDine. *Risk D: Consider therapy modification*

Ranolazine: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Ranolazine. Management: Limit the ranolazine dose to a maximum of 500mg twice daily in patients concurrently receiving moderate CYP3A4 inhibitors (e.g., diltiazem, verapamil, erythromycin, etc.). *Risk D: Consider therapy modification*

Repaglinide: Macrolide Antibiotics may increase the serum concentration of Repaglinide. *Risk C: Monitor therapy*

Rifamycin Derivatives: Macrolide Antibiotics may decrease the metabolism of Rifamycin Derivatives. **Exceptions:** Rifapentine. *Risk D: Consider therapy modification*

Rivaroxaban: Erythromycin may increase the serum concentration of Rivaroxaban. *Risk C: Monitor therapy*

Salmeterol: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: Macrolide Antibiotics may decrease the metabolism of Selective Serotonin Reuptake Inhibitors. **Exceptions:** Fluvoxamine; PARoxetine. *Risk C: Monitor therapy*

Sirolimus: Macrolide Antibiotics may decrease the metabolism of Sirolimus. *Risk D: Consider therapy modification*

Tacrolimus: Macrolide Antibiotics may increase the serum concentration of Tacrolimus. *Risk C: Monitor therapy*

Temsirolimus: Macrolide Antibiotics may enhance the adverse/toxic effect of Temsirolimus. Levels of sirolimus, the active metabolite, may be increased, likely due to inhibition of CYP-mediated metabolism. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Theophylline Derivatives: Macrolide Antibiotics may decrease the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk D: Consider therapy modification*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Topotecan: P-Glycoprotein Inhibitors may increase the serum concentration of Topotecan. *Risk X: Avoid combination*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Macrolide Antibiotics may decrease the metabolism of Vitamin K Antagonists. *Risk C: Monitor therapy*

Zafirlukast: Erythromycin may decrease the serum concentration of Zafirlukast. *Risk C: Monitor therapy*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Zopiclone: Macrolide Antibiotics may increase the serum concentration of Zopiclone. *Risk D: Consider therapy modification*

Medication Safety Issues

Sound-alike/look-alike issues:

Pediazole® may be confused with Pediapred®

Pronunciation(er ith roe MYE sin & sul fi SOKS a zole)
U.S. Brand NamesE.S.P.®
Canadian Brand NamesPediazole®
Pharmacologic CategoryAntibiotic, Macrolide; Antibiotic, Macrolide Combination; Antibiotic, Sulfonamide Derivative
Use: Labeled IndicationsTreatment of susceptible bacterial infections of the upper and lower respiratory tract, otitis media in children caused by susceptible strains of *Haemophilus influenzae*, and many other infections in patients allergic to penicillin
Dosing: AdultsSusceptible infections: Oral (dosage recommendation is based on the product's erythromycin content): 400 mg erythromycin and 1200 mg sulfisoxazole every 6 hours
Dosing: ElderlyNot recommended for use in the elderly.
Dosing: PediatricSusceptible infections: Oral (dosage recommendation is based on the product's erythromycin content): ≥2 months: 50 mg/kg/day erythromycin and 150 mg/kg/day sulfisoxazole in divided doses every 6 hours; not to exceed 2 g erythromycin/day or 6 g sulfisoxazole/day for 10 days
Dosing: Renal ImpairmentSulfisoxazole must be adjusted in renal impairment.

Cl_{cr} 10-50 mL/minute: Administer every 8-12 hours.

Cl_{cr} <10 mL/minute: Administer every 12-24 hours.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

StorageReconstituted suspension is stable for 14 days when refrigerated.
ContraindicationsHypersensitivity to erythromycin, sulfonamides, or any component of the formulation; hepatic dysfunction; infants <2 months of age (sulfas compete with bilirubin for binding sites); porphyria; concurrent use with pimozide or cisapride
Allergy Considerations

- Macrolide Allergy
- Sulfonamide Antibiotic Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Altered cardiac conduction: Macrolides have been associated with rare QT_c prolongation and ventricular arrhythmias, including torsade de pointes; use with caution in patients at risk of prolonged cardiac repolarization.

- Sulfonamide allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). In patients with allergy to one of these compounds, a risk of cross-reaction exists; avoid use when previous reaction has been severe.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- G6PD deficiency: Use with caution in patients with G6PD deficiency; hemolysis may occur.

- Hepatic impairment: Use with caution in patients with pre-existing liver disease; hepatic impairment, including hepatocellular and/or cholestatic hepatitis, with or without jaundice, has been observed. Discontinue if symptoms of malaise, nausea, vomiting, abdominal colic, and fever.

- Myasthenia gravis: Erythromycin has been associated with aggravation of weakness associated with myasthenia gravis.

- Renal impairment: Use with caution in patients with renal impairment.

Pregnancy Risk FactorC
LactationEnters breast milk/compatible
Adverse ReactionsFrequency not defined.

Cardiovascular: Ventricular arrhythmia,

Central nervous system: Headache, fever

Dermatologic: Rash, Stevens-Johnson syndrome, toxic epidermal necrolysis

Gastrointestinal: Abdominal pain, cramping, nausea, vomiting, oral candidiasis, hypertrophic pyloric stenosis, diarrhea, pseudomembranous colitis

Hematologic: Agranulocytosis, aplastic anemia, eosinophilia

Hepatic: Hepatic necrosis, cholestatic jaundice

Local: Phlebitis at the injection site, thrombophlebitis

Renal: Toxic nephrosis, crystalluria

Miscellaneous: Hypersensitivity reactions

Metabolism/Transport Effects

Erythromycin: **Substrate** of CYP2B6 (minor), 3A4 (major); **Inhibits** CYP1A2 (weak), 3A4 (moderate)

Sulfisoxazole: **Substrate** of CYP2C8/9 (major); **Inhibits** CYP2C8/9 (strong)

Drug Interactions

Alfentanil: Macrolide Antibiotics may decrease the metabolism of Alfentanil. *Risk D: Consider therapy modification*

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): Macrolide Antibiotics may decrease the metabolism of Antifungal Agents (Azole Derivatives, Systemic). Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Macrolide Antibiotics. *Risk D: Consider therapy modification*

Benzodiazepines (metabolized by oxidation): Macrolide Antibiotics may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

BusPIRone: Macrolide Antibiotics may decrease the metabolism of BusPIRone. *Risk D: Consider therapy modification*

Calcium Channel Blockers: Macrolide Antibiotics may decrease the metabolism of Calcium Channel Blockers. **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

CarBAMazepine: Macrolide Antibiotics may decrease the metabolism of CarBAMazepine. *Risk D: Consider therapy modification*

Cardiac Glycosides: Macrolide Antibiotics may increase the serum concentration of Cardiac Glycosides. *Risk D: Consider therapy modification*

Cilostazol: Macrolide Antibiotics may decrease the metabolism of Cilostazol. *Risk D: Consider therapy modification*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Cisapride: Macrolide Antibiotics may decrease the metabolism of Cisapride. *Risk X: Avoid combination*

Clopidogrel: Macrolide Antibiotics may diminish the therapeutic effect of Clopidogrel. *Risk C: Monitor therapy*

Clozapine: Macrolide Antibiotics may decrease the metabolism of Clozapine. *Risk D: Consider therapy modification*

Colchicine: Macrolide Antibiotics may decrease the metabolism of Colchicine. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Macrolide Antibiotics may decrease the metabolism of Corticosteroids (Systemic). *Risk D: Consider therapy modification*

CycloSPORINE: Macrolide Antibiotics may decrease the metabolism of CycloSPORINE. *Risk C: Monitor therapy*

CycloSPORINE: Sulfonamide Derivatives may enhance the nephrotoxic effect of CycloSPORINE. Sulfonamide Derivatives may decrease the serum concentration of CycloSPORINE. *Risk C: Monitor therapy*

CYP2C9 Inducers (Highly Effective): May increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Moderate): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Strong): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Strong) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dabigatran Etexilate: P-Glycoprotein Inhibitors may increase the serum concentration of Dabigatran Etexilate. *Risk X: Avoid combination*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Disopyramide: Macrolide Antibiotics may enhance the QTc-prolonging effect of Disopyramide. Macrolide Antibiotics may decrease the metabolism of Disopyramide. *Risk X: Avoid combination*

Eletriptan: Macrolide Antibiotics may decrease the metabolism of Eletriptan. *Risk D: Consider therapy modification*

Eplerenone: Macrolide Antibiotics may decrease the metabolism of Eplerenone. *Risk C: Monitor therapy*

Ergot Derivatives: Macrolide Antibiotics may enhance the adverse/toxic effect of Ergot Derivatives. Specifically leading the development of ergotism. **Exceptions:** Cabergoline. *Risk D: Consider therapy modification*

Etravirine: May decrease the serum concentration of Macrolide Antibiotics. Clarithromycin AUC is reduced and levels of the active metabolite (14-hydroxy-clarithromycin) are modestly increased. Management: For the treatment of *Mycobacterium avium* complex, consider changing to alternative agent, such as azithromycin. *Risk D: Consider therapy modification*

FentaNYL: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Fexofenadine: Erythromycin may increase the serum concentration of Fexofenadine. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

HMG-CoA Reductase Inhibitors: Macrolide Antibiotics may decrease the metabolism of HMG-CoA Reductase Inhibitors. **Exceptions:** Fluvastatin; Pravastatin; Rosuvastatin. *Risk D: Consider therapy modification*

Lincosamide Antibiotics: May diminish the therapeutic effect of Erythromycin. *Risk X: Avoid combination*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Methotrexate: Sulfonamide Derivatives may enhance the adverse/toxic effect of Methotrexate. *Risk D: Consider therapy modification*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inhibitors may increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phenytoin: Sulfonamide Derivatives may decrease the metabolism of Phenytoin. *Risk C: Monitor therapy*

Phosphodiesterase 5 Inhibitors: Macrolide Antibiotics may decrease the metabolism of Phosphodiesterase 5 Inhibitors. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Pimozide: Macrolide Antibiotics may decrease the metabolism of Pimozide. QTc prolongation is a risk. *Risk X: Avoid combination*

Procaine: May diminish the therapeutic effect of Sulfonamide Derivatives. *Risk X: Avoid combination*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

QuiNIDine: Macrolide Antibiotics may decrease the metabolism of QuiNIDine. *Risk D: Consider therapy modification*

Ranolazine: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Ranolazine. Management: Limit the ranolazine dose to a maximum of 500mg twice daily in patients concurrently receiving moderate CYP3A4 inhibitors (e.g., diltiazem, verapamil, erythromycin, etc.). *Risk D: Consider therapy modification*

Repaglinide: Macrolide Antibiotics may increase the serum concentration of Repaglinide. *Risk C: Monitor therapy*

Rifamycin Derivatives: Macrolide Antibiotics may decrease the metabolism of Rifamycin Derivatives. **Exceptions:** Rifapentine. *Risk D: Consider therapy modification*

Rivaroxaban: Erythromycin may increase the serum concentration of Rivaroxaban. *Risk C: Monitor therapy*

Salmeterol: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: Macrolide Antibiotics may decrease the metabolism of Selective Serotonin Reuptake Inhibitors. **Exceptions:** Fluvoxamine; PARoxetine. *Risk C: Monitor therapy*

Sirolimus: Macrolide Antibiotics may decrease the metabolism of Sirolimus. *Risk D: Consider therapy modification*

Sulfonylureas: Sulfonamide Derivatives may enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

Tacrolimus: Macrolide Antibiotics may increase the serum concentration of Tacrolimus. *Risk C: Monitor therapy*

Temsirolimus: Macrolide Antibiotics may enhance the adverse/toxic effect of Temsirolimus. Levels of sirolimus, the active metabolite, may be increased, likely due to inhibition of CYP-mediated metabolism. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Theophylline Derivatives: Macrolide Antibiotics may decrease the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk D: Consider therapy modification*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Topotecan: P-Glycoprotein Inhibitors may increase the serum concentration of Topotecan. *Risk X: Avoid combination*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Sulfonamide Derivatives may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Macrolide Antibiotics may decrease the metabolism of Vitamin K Antagonists. *Risk C: Monitor therapy*

Zafirlukast: Erythromycin may decrease the serum concentration of Zafirlukast. *Risk C: Monitor therapy*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Zopiclone: Macrolide Antibiotics may increase the serum concentration of Zopiclone. *Risk D: Consider therapy modification*

Test InteractionsFalse-positive urinary protein
Monitoring ParametersCBC and periodic liver function test

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Powder for oral suspension: Erythromycin ethylsuccinate 200 mg and sulfisoxazole acetyl 600 mg per 5 mL (100 mL, 150 mL, 200 mL)

E.S.P.®: Erythromycin ethylsuccinate 200 mg and sulfisoxazole acetyl 600 mg per 5 mL (100 mL, 150 mL, 200 mL) [cheri beri flavor]

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Suspension (reconstituted) (Erythromycin-Sulfisoxazole)

200-600 mg/5 mL (100): $10.99

200-600 mg/5 mL (150): $26.00

200-600 mg/5 mL (200): $31.00

Suspension (reconstituted) (Pediazole)

200-600 mg/5 mL (100): $20.99

200-600 mg/5 mL (150): $29.99

200-600 mg/5 mL (200): $37.98

Mechanism of ActionErythromycin inhibits bacterial protein synthesis; sulfisoxazole competitively inhibits bacterial synthesis of folic acid from para-aminobenzoic acid
Pharmacodynamics/KineticsSee individual agents.
Related Information

- Erythromycin
- SulfiSOXAZOLE

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Oral candidiasis.
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMacrolides have been reported to cause nightmares, confusion, anxiety, and mood lability; dizziness is common with sulfisoxazole; sulfonamides reported to cause restlessness, irritability, depression, euphoria, disorientation, panic, hallucinations, and delusions
Mental Health: Effects on Psychiatric TreatmentErythromycin is contraindicated with pimozide; may increase concentration of bromocriptine, carbamazepine, and triazolam; photosensitivity is common with sulfisoxazole; use caution with concurrent psychotropics; may cause leukopenia; caution with clozapine and carbamazepine
Index TermsSulfisoxazole and Erythromycin

Pharmacologic CategoryAcne Products; Antibiotic, Macrolide; Antibiotic, Ophthalmic; Antibiotic, Topical; Topical Skin Product; Topical Skin Product, Acne

Use: Labeled Indications

Systemic: Treatment of susceptible bacterial infections including *S. pyogenes*, some *S. pneumoniae,* some *S. aureus*, *M. pneumoniae*, *Legionella pneumophila*, diphtheria, pertussis, *Chlamydia*, erythrasma, *N. gonorrhoeae*, *E. histolytica*, syphilis and nongonococcal urethritis, and *Campylobacter* gastroenteritis; used in conjunction with neomycin for decontaminating the bowel

Ophthalmic: Treatment of superficial eye infections involving the conjunctiva or cornea; neonatal ophthalmia

Topical: Treatment of acne vulgaris

Use: Unlabeled/InvestigationalSystemic: Treatment of gastroparesis, chancroid; preoperative gut sterilization

Use: DentalSystemic: Alternative to penicillin VK for treatment of orofacial infections

Dosing: Adults**Note:** Due to differences in absorption, 400 mg erythromycin ethylsuccinate produces the same serum levels as 250 mg erythromycin base or stearate.

Usual dosage range:

Ophthalmic: Instill $^{1}/_{2}$" (1.25 cm) 2-6 times/day depending on the severity of the infection

Topical: Apply over the affected area twice daily after the skin has been thoroughly washed and patted dry

Oral:

Base: 250-500 mg every 6-12 hours

Ethylsuccinate: 400-800 mg every 6-12 hours

I.V.: Lactobionate: 15-20 mg/kg/day divided every 6 hours or 500 mg to 1 g every 6 hours, or given as a continuous infusion over 24 hours (maximum: 4 g/24 hours)

Indication-specific dosing:

***Bartonella sp*infections (bacillary angiomatosis [BA], peliosis hepatis [PH]) (unlabeled use):** Oral: 500 mg (base) 4 times/day for 3 months (BA) or 4 months (PH)

Chancroid (unlabeled use): Oral: 500 mg (base) 3 times/day for 7 days; Note: Not a preferred agent; isolates with intermediate resistance have been documented

Gastrointestinal prokinetic (unlabeled use): I.V.: 200 mg initially followed by 250 mg (base) orally 3 times/day 30 minutes before meals. Lower dosages have been used in some trials.

Granuloma inguinale*(K. granulomatis)*(unlabeled use): Oral: 500 mg (base) 4 times/day for 21 days

Legionnaires' disease: Oral: 1.6-4 g (ethylsuccinate)/day or 1-4 g (base)/day in divided doses for 21 days. **Note:** No longer preferred therapy and only used in nonhospitalized patients.

Lymphogranuloma venereum: Oral: 500 mg (base) 4 times/day for 21 days

Nongonococcal urethritis (including coinfection with*C. trachomatis*): Oral: 500 mg (base) 4 times/day for 7 days or 800 mg (ethylsuccinate) 4 times/day for 7 days. **Note:** May use 250 mg (base) or 400 mg (ethylsuccinate) 4 times/day for 14 days if gastrointestinal intolerance.

Pelvic inflammatory disease: I.V.: 500 mg every 6 hours for 3 days, followed by 1000 mg (base)/day orally in 2-4 divided doses for 7 days. **Note:** Not recommended therapy per current treatment guidelines.

Pertussis: Oral: 500 mg (base) every 6 hours for 14 days

Preop bowel preparation (unlabeled use): Oral: 1 g erythromycin base at 1, 2, and 11 PM on the day before surgery combined with mechanical cleansing of the large intestine and oral neomycin

Syphilis, primary: Oral: 48-64 g (ethylsuccinate) or 30-40 g (base) in divided doses over 10-15 days. **Note:** Not recommended therapy per current treatment guidelines.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** Due to differences in absorption, 400 mg erythromycin ethylsuccinate produces the same serum levels as 250 mg erythromycin base or stearate.

Usual dosage range: Infants and Children:

Oral:

Base: 30-50 mg/kg/day in 2-4 divided doses; maximum: 2 g/day

Ethylsuccinate: 30-50 mg/kg/day in 2-4 divided doses; maximum: 3.2 g/day

Stearate: 30-50 mg/kg/day in 2-4 divided doses; maximum: 2 g/day

I.V.: Lactobionate: 15-50 mg/kg/day divided every 6 hours, not to exceed 4 g/day

Ophthalmic: Refer to adult dosing.

Topical: Refer to adult dosing.

Indication-specific dosing:

***Bartonella sp*infections (bacillary angiomatosis [BA], peliosis hepatis [PH]) (unlabeled use):** Oral: 40 mg/kg/day (ethylsuccinate) in 4 divided doses (maximum: 2 g/day) for 3 months (BA) or 4 months (PH)

Conjunctivitis, neonatal*(C. trachomatis):* Oral: 50 mg/kg/day (base or ethylsuccinate) in 4 divided doses for 14 days

Mild/moderate infection: Oral: 30-50 mg/kg/day in divided doses every 6-12 hours

Pertussis: Oral: 40-50 mg/kg/day in 4 divided doses for 14 days; maximum 2 g/day (not preferred agent for infants <1 month due to IHPS)

Pharyngitis, tonsillitis (streptococcal): Oral: 20 mg (base)/kg/day or 40 mg (ethylsuccinate)/kg/day in 2 divided doses for 10 days. **Note:** No longer preferred therapy due to increased organism resistance.

Pneumonia*(C. trachomatis):* Oral: 50 mg/kg/day (base or ethylsuccinate) in 4 divided doses for 14-21 days

Preop bowel preparation: Oral: 20 mg (base)/kg at 1, 2, and 11 PM on the day before surgery combined with mechanical cleansing of the large intestine and oral neomycin

Severe infection: I.V.: 15-50 mg/kg/day; maximum: 4 g/day

Dosing: Renal ImpairmentSlightly dialyzable (5% to 20%); supplemental dose is not necessary in hemo- or peritoneal dialysis or in continuous arteriovenous or venovenous hemofiltration.

Administration: I.V.Infuse 1 g over 20-60 minutes.

Administration: I.V. DetailI.V. infusion may be very irritating to the vein. If phlebitis/pain occurs with used dilution, consider diluting further (eg, 1:5) if fluid status of the patient will tolerate, or consider administering in larger available vein. The addition of lidocaine or bicarbonate does not decrease the irritation of erythromycin infusions.

pH: Erythromycin lactobionate: 6.5-7.5 (reconstituted with sterile water for injection or D_5W to a 50 mg/mL concentration)

Administration: OralDo not crush enteric coated drug product. GI upset, including diarrhea, is common. May be administered with food to decrease GI upset. Do not give with milk or acidic beverages.

Administration: OtherAvoid contact of tip of ophthalmic ointment tube with affected eye.

Dietary Considerations

Systemic: Drug may cause GI upset; may take with food.

E.E.S.® granules for oral suspension contain sodium 25.9 mg (1.1 mEq)/5 mL

EryPed® powder for oral suspension contains sodium 117.5 mg (5.1 mEq)/5 mL; powder for oral suspension (drops) contains sodium 58.8 mg (2.6 mEq)/dropperful dose

Storage

Injection: Store unreconstituted vials at 15°C to 30°C (59°F to 86°F). Reconstituted solution is stable for 2 weeks when refrigerated or for 8 hours at room temperature. Erythromycin I.V. infusion solution is stable at pH 6-8; stability of lactobionate is pH dependent; I.V. form has longest stability in NS. Stability of parenteral admixture at room temperature (25°C) and at refrigeration temperature (4°C) is 24 hours.

Oral suspension:

Granules: After mixing, store under refrigeration and use within 10 days.

Powder: Refrigerate to preserve taste. Erythromycin ethylsuccinate may be stored at room temperature if used within 14 days. EryPed® drops should be used within 35 days following reconstitution. May store at room temperature or under refrigeration.

Tablet and capsule formulations: Store at <30°C (<86°F).

Topical and ophthalmic formulations: Store at room temperature.

Reconstitution Erythromycin lactobionate should be reconstituted with sterile water for injection without preservatives to avoid gel formation. I.V. form has the longest stability in NS and should be prepared in this base solution whenever possible. Do not use D_5W as a diluent unless sodium bicarbonate is added to solution. If I.V. must be prepared in D_5W, 0.5 mL of the 8.4% sodium bicarbonate solution should be added per each 100 mL of D_5W.

Standard diluent: 500 mg/250 mL D_5W/NS; 750 mg/250 mL D_5W/NS; 1 g/250 mL D_5W/NS.

Compatibility

Erythromycin lactobionate: Stable in NS; **incompatible** with D_5LR, $D_{10}W$; **variable stability (consult detailed reference)** in D_5NS, D_5W, LR.

Y-site administration: Compatible: Acyclovir, amiodarone, cyclophosphamide, diltiazem, enalaprilat, esmolol, famotidine, foscarnet, heparin, hydromorphone, idarubicin, labetalol, lorazepam, magnesium sulfate, meperidine, midazolam, morphine, multivitamins, perphenazine, tacrolimus, theophylline, vitamin B complex with C, zidovudine. **Incompatible:** Fluconazole.

Compatibility in syringe: Incompatible: Ampicillin, heparin.

Compatibility when admixed: Compatible: Aminophylline, ampicillin, cimetidine, diphenhydramine, hydrocortisone sodium succinate, lidocaine, penicillin G potassium, penicillin G sodium, pentobarbital, polymyxin B sulfate, potassium chloride, prochlorperazine edisylate, promazine, ranitidine, sodium bicarbonate, verapamil. **Incompatible:** Colistimethate, floxacillin, furosemide, heparin, metaraminol, metoclopramide, riboflavin, vitamin B complex with C. **Variable (consult detailed reference):** Ascorbic acid injection.

Contraindications Hypersensitivity to erythromycin or any component of the formulation

Systemic: Concomitant use with pimozide or cisapride

Allergy Considerations

- Macrolide Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Altered cardiac conduction: Macrolides have been associated with rare QT_c prolongation and ventricular arrhythmias, including torsade de pointes; use with caution in patients at risk of prolonged cardiac repolarization.
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with pre-existing liver disease; hepatic impairment, including hepatocellular and/or cholestatic hepatitis, with or without jaundice, has been observed. Discontinue if symptoms of malaise, nausea, vomiting, abdominal colic, and fever.
- Myasthenia gravis: Erythromycin has been associated with aggravation of weakness associated with myasthenia gravis.

Concurrent drug therapy issues:

- Major inhibitor of CYP3A4: Use caution with any agents with substantial metabolism through the CYP3A4 pathway; high potential for drug interactions exists.

Special populations:

- Infants: Use of erythromycin has been associated with infantile hypertrophic pyloric stenosis (IHPS); observe for non-bilious vomiting or irritability with feeding.
- Elderly: May be at increased risk of adverse events, including hearing loss and/or torsade de pointes when dosage ≥4 g/day, particularly if concurrent renal/hepatic impairment.

Geriatric Considerations Dose does not need to be adjusted unless there is severe renal or hepatic impairment. Elderly may be at an increased risk for torsade de pointes, ototoxicity (particularly when dose is ≥4 g/day in conjunction with renal or hepatic impairment).

Pregnancy Risk Factor B

Pregnancy Considerations Adverse events were not observed in animal studies; therefore, erythromycin is classified as pregnancy category B. Low levels of erythromycin have been shown to cross the placenta and erythromycin is considered the drug of choice for certain illnesses in pregnant women. Most studies do not support a link between prenatal exposure to erythromycin and pyloric stenosis in the neonate. No increased risk for congenital abnormalities has been documented, with the exception of a possible slight increase in risk for cardiovascular anomalies. No adequate and well-controlled studies have been completed in pregnant women. The estolate form of erythromycin should not be used in pregnancy due to a potential increased risk for hepatic toxicity.

LactationEnters breast milk/use caution (AAP considers “compatible”)

Breast-Feeding ConsiderationsErythromycin is excreted in breast milk; therefore, the manufacturer recommends that caution be exercised when administering erythromycin to breast-feeding women.

Due to the low concentrations in human milk, minimal toxicity would be expected in the nursing infant. One case report and a cohort study raise the possibility for a connection with pyloric stenosis in neonates exposed to erythromycin via breast milk and an alternative antibiotic may be preferred for breast-feeding mothers of infants in this age group. Nondose-related effects could include modification of bowel flora. The AAP considers erythromycin to be “usually compatible with breast-feeding.”

Pregnancy & Lactation, In-Depth

- Erythromycin in Pregnancy & Lactation

Adverse ReactionsFrequency not defined. Incidence may vary with formulation.

Systemic:

Cardiovascular: QT_c prolongation, torsade de pointes, ventricular arrhythmia, ventricular tachycardia

Central nervous system: Seizure

Dermatitis: Pruritus, rash

Gastrointestinal: Abdominal pain, anorexia, diarrhea, infantile hypertrophic pyloric stenosis, nausea, oral candidiasis, pancreatitis, pseudomembranous colitis, vomiting

Hepatic: Cholestatic jaundice (most common with estolate), hepatitis, liver function tests abnormal

Local: Phlebitis at the injection site, thrombophlebitis

Neuromuscular & skeletal: Weakness

Otic: Hearing loss

Miscellaneous: Allergic reactions, anaphylaxis, hypersensitivity reactions, urticaria

Topical: 1% to 10%: Dermatologic: Erythema, desquamation, dryness, pruritus

Metabolism/Transport Effects**Substrate** of CYP2B6 (minor), 3A4 (major); **Inhibits** CYP1A2 (weak), 3A4 (moderate)

Drug Interactions

Alfentanil: Macrolide Antibiotics may decrease the metabolism of Alfentanil. *Risk D: Consider therapy modification*

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): Macrolide Antibiotics may decrease the metabolism of Antifungal Agents (Azole Derivatives, Systemic). Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Macrolide Antibiotics. *Risk D: Consider therapy modification*

Benzodiazepines (metabolized by oxidation): Macrolide Antibiotics may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

BusPIRone: Macrolide Antibiotics may decrease the metabolism of BusPIRone. *Risk D: Consider therapy modification*

Calcium Channel Blockers: Macrolide Antibiotics may decrease the metabolism of Calcium Channel Blockers. **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

CarBAMazepine: Macrolide Antibiotics may decrease the metabolism of CarBAMazepine. *Risk D: Consider therapy modification*

Cardiac Glycosides: Macrolide Antibiotics may increase the serum concentration of Cardiac Glycosides. *Risk D: Consider therapy modification*

Cilostazol: Macrolide Antibiotics may decrease the metabolism of Cilostazol. *Risk D: Consider therapy modification*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Cisapride: Macrolide Antibiotics may decrease the metabolism of Cisapride. *Risk X: Avoid combination*

Clopidogrel: Macrolide Antibiotics may diminish the therapeutic effect of Clopidogrel. *Risk C: Monitor therapy*

Clozapine: Macrolide Antibiotics may decrease the metabolism of Clozapine. *Risk D: Consider therapy modification*

Colchicine: Macrolide Antibiotics may decrease the metabolism of Colchicine. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Macrolide Antibiotics may decrease the metabolism of Corticosteroids (Systemic). *Risk D: Consider therapy modification*

CycloSPORINE: Macrolide Antibiotics may decrease the metabolism of CycloSPORINE. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dabigatran Etexilate: P-Glycoprotein Inhibitors may increase the serum concentration of Dabigatran Etexilate. *Risk X: Avoid combination*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Disopyramide: Macrolide Antibiotics may enhance the QTc-prolonging effect of Disopyramide. Macrolide Antibiotics may decrease the metabolism of Disopyramide. *Risk X: Avoid combination*

Eletriptan: Macrolide Antibiotics may decrease the metabolism of Eletriptan. *Risk D: Consider therapy modification*

Eplerenone: Macrolide Antibiotics may decrease the metabolism of Eplerenone. *Risk C: Monitor therapy*

Ergot Derivatives: Macrolide Antibiotics may enhance the adverse/toxic effect of Ergot Derivatives. Specifically leading the development of ergotism. **Exceptions:** Cabergoline. *Risk D: Consider therapy modification*

Etravirine: May decrease the serum concentration of Macrolide Antibiotics. Clarithromycin AUC is reduced and levels of the active metabolite (14-hydroxy-clarithromycin) are modestly increased. Management: For the treatment of *Mycobacterium avium* complex, consider changing to alternative agent, such as azithromycin. *Risk D: Consider therapy modification*

FentaNYL: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Fexofenadine: Erythromycin may increase the serum concentration of Fexofenadine. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

HMG-CoA Reductase Inhibitors: Macrolide Antibiotics may decrease the metabolism of HMG-CoA Reductase Inhibitors. **Exceptions:** Fluvastatin; Pravastatin; Rosuvastatin. *Risk D: Consider therapy modification*

Lincosamide Antibiotics: May diminish the therapeutic effect of Erythromycin. *Risk X: Avoid combination*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inhibitors may increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phosphodiesterase 5 Inhibitors: Macrolide Antibiotics may decrease the metabolism of Phosphodiesterase 5 Inhibitors. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Pimozide: Macrolide Antibiotics may decrease the metabolism of Pimozide. QTc prolongation is a risk. *Risk X: Avoid combination*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

QuiNIDine: Macrolide Antibiotics may decrease the metabolism of QuiNIDine. *Risk D: Consider therapy modification*

Ranolazine: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Ranolazine. Management: Limit the ranolazine dose to a maximum of 500mg twice daily in patients concurrently receiving moderate CYP3A4 inhibitors (e.g., diltiazem, verapamil, erythromycin, etc.). *Risk D: Consider therapy modification*

Repaglinide: Macrolide Antibiotics may increase the serum concentration of Repaglinide. *Risk C: Monitor therapy*

Rifamycin Derivatives: Macrolide Antibiotics may decrease the metabolism of Rifamycin Derivatives. **Exceptions:** Rifapentine. *Risk D: Consider therapy modification*

Rivaroxaban: Erythromycin may increase the serum concentration of Rivaroxaban. *Risk C: Monitor therapy*

Salmeterol: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: Macrolide Antibiotics may decrease the metabolism of Selective Serotonin Reuptake Inhibitors. **Exceptions:** Fluvoxamine; PARoxetine. *Risk C: Monitor therapy*

Sirolimus: Macrolide Antibiotics may decrease the metabolism of Sirolimus. *Risk D: Consider therapy modification*

Tacrolimus: Macrolide Antibiotics may increase the serum concentration of Tacrolimus. *Risk C: Monitor therapy*

Temsirolimus: Macrolide Antibiotics may enhance the adverse/toxic effect of Temsirolimus. Levels of sirolimus, the active metabolite, may be increased, likely due to inhibition of CYP-mediated metabolism. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Theophylline Derivatives: Macrolide Antibiotics may decrease the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk D: Consider therapy modification*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Topotecan: P-Glycoprotein Inhibitors may increase the serum concentration of Topotecan. *Risk X: Avoid combination*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Macrolide Antibiotics may decrease the metabolism of Vitamin K Antagonists. *Risk C: Monitor therapy*

Zafirlukast: Erythromycin may decrease the serum concentration of Zafirlukast. *Risk C: Monitor therapy*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Zopiclone: Macrolide Antibiotics may increase the serum concentration of Zopiclone. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may decrease absorption of erythromycin or enhance ethanol effects).

Food: Erythromycin serum levels may be altered if taken with food (formulation-dependent).

Herb/Nutraceutical: St John's wort may decrease erythromycin levels.

Test InteractionsFalse-positive urinary catecholamines

Nursing: Physical Assessment/MonitoringAssess results of culture and sensitivity tests and patient's previous allergy history prior to therapy. Assess potential for interactions with other pharmacological agents or herbal products patient may be taking. Assess therapeutic effectiveness and adverse reactions. Teach patient proper use (according to formulation and purpose for use), possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsPerform culture and sensitivity studies prior to initiating drug therapy.

Patient EducationDo not take any new prescription or OTC medications, or herbal products during therapy without consulting prescriber. Take exactly as directed:

Ophthalmic: Preparations should be used exactly as directed. Always wash hands before applying ophthalmic preparations and do not let tip of applicator touch eye or become contaminated.

Suspension: Mix granules exactly as directed and store in refrigerator after mixing; mix powder as directed; store at room temperature or in refrigerator.

Tablets/capsules: Take as directed, around-the-clock, with a full glass of water (not juice or milk); may take with food to reduce GI upset. Do not chew or crush extended release capsules or tablets.

Topical: Apply as directed after skin has been cleansed and gently dried.

Take complete prescription even if you are feeling better. Avoid alcohol (may cause adverse response). May cause nausea, vomiting, or mouth sores (small, frequent meals, frequent mouth care may help). Report immediately any unusual malaise, nausea, vomiting, abdominal colic, or fever; skin rash or itching; easy bruising or bleeding; vaginal itching or discharge; watery or bloody diarrhea; yellowing of skin or eyes, pale stool or dark urine; persistent diarrhea; white plaques, sores, or fuzziness in mouth; or any change in hearing.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product; [CAN] = Canadian brand name

Note: Strength expressed as base

Capsule, delayed release, enteric-coated pellets, as base: 250 mg

Eryc®: 250 mg [DSC]

Gel, topical: 2% (30 g, 60 g)

Erygel®: 2% (30 g, 60 g) [DSC] [contains alcohol 92%]

Granules for oral suspension, as ethylsuccinate:

E.E.S.®: 200 mg/5 mL (100 mL, 200 mL) [contains sodium 25.9 mg (1.1 mEq)/5 mL; cherry flavor]

Injection, powder for reconstitution, as lactobionate:

Erythrocin®: 500 mg, 1 g

Ointment, ophthalmic: 0.5% [5 mg/g] (1 g, 3.5 g)

Romycin®: 0.5% [5 mg/g] (3.5 g)

Ointment, topical:

Akne-Mycin®: 2% (25 g)

Powder for oral suspension, as ethylsuccinate:

EryPed®: 200 mg/5 mL (100 mL, 200 mL [DSC]) [contains sodium 117.5 mg (5.1 mEq)/5 mL; fruit flavor]; 400 mg/5 mL (100 mL, 200 mL [DSC]) [contains sodium 117.5 mg (5.1 mEq)/5 mL; banana flavor]

Powder for oral suspension, as ethylsuccinate [drops]:

EryPed®: 100 mg/2.5 mL (50 mL) [DSC] [contains sodium 58.8 mg (2.6 mEq)/dropperful; fruit flavor]

Powder, for prescription compounding:

Erythro-RX: USP (50 g)

Solution, topical: 2% (60 mL)

Eryderm®: 2% (60 mL) [contain alcohol] [DSC]

Sans acne [CAN]: 2% (60 mL) [contains ethyl alcohol 44%; not available in U.S.]

Suspension, oral, as ethylsuccinate: 200 mg/5 mL (480 mL) [DSC]; 400 mg/5 mL (480 mL) [DSC]

E.E.S.®: 200 mg/5 mL (100 mL, 480 mL) [fruit flavor] [DSC]; 400 mg/5 mL (100 mL, 480 mL) [orange flavor]

Tablet, as base: 250 mg, 500 mg

Tablet, as base [polymer-coated particles]:

PCE®: 333 mg, 500 mg

Tablet, as ethylsuccinate: 400 mg

E.E.S.®: 400 mg [DSC]

Tablet, as stearate: 250 mg, 500 mg

Erythrocin®: 250 mg, 500 mg

Tablet, delayed release, enteric coated, as base:

Ery-Tab®: 250 mg, 333 mg, 500 mg

Generic AvailableYes: Capsule, gel, ophthalmic ointment, topical solution, suspension (as ethylsuccinate), swab, tablet (as base, ethylsuccinate, and stearate)

Pricing: U.S. (www.drugstore.com)

Capsule, enteric pellets (Erythromycin Base)

250 mg (30): $13.99

Gel (Erygel)

2% (30): $35.99

Gel (Erythromycin)

2% (30): $18.65

2% (60): $38.65

Ointment (Erythromycin)

5 mg/g (3.5): $11.99

Solution (Eryderm)

2% (60): $25.99

Solution (Erythromycin)

2% (60): $26.13

Suspension (E.E.S. 200)

200 mg/5 mL (200): $13.18

Suspension (E.E.S. 400)

400 mg/5 mL (100): $12.99

Suspension (Erythromycin Ethylsuccinate)

200 mg/5 mL (200): $15.00

400 mg/5 mL (100): $10.99

Suspension (reconstituted) (E.E.S. Granules)

200 mg/5 mL (100): $12.99

200 mg/5 mL (200): $20.98

Tablet, EC (Ery-Tab)

250 mg (40): $17.99

333 mg (30): $16.99

500 mg (20): $15.99

Tablet, EC (PCE)

333 mg (30): $70.04

500 mg (20): $61.79

Tablets (E.E.S. 400)

400 mg (40): $12.99

Tablets (Erythrocin Stearate)

250 mg (30): $13.99

500 mg (20): $13.99

Tablets (Erythromycin Base)

250 mg (30): $13.99

500 mg (30): $16.99

Tablets (Erythromycin Ethylsuccinate)

400 mg (40): $16.99

Mechanism of ActionInhibits RNA-dependent protein synthesis at the chain elongation step; binds to the 50S ribosomal subunit resulting in blockage of transpeptidation

Pharmacodynamics/Kinetics

Absorption: Oral: Variable but better with salt forms than with base form; 18% to 45%; ethylsuccinate may be better absorbed with food

Distribution:

Relative diffusion from blood into CSF: Minimal even with inflammation

CSF:blood level ratio: Normal meninges: 2% to 13%; Inflamed meninges: 7% to 25%

Protein binding: Base: 73% to 81%

Metabolism: Demethylation primarily via hepatic CYP3A4

Half-life elimination: Peak: 1.5-2 hours; End-stage renal disease: 5-6 hours

Time to peak, serum: Base: 4 hours; Ethylsuccinate: 0.5-2.5 hours; delayed with food due to differences in absorption

Excretion: Primarily feces; urine (2% to 15% as unchanged drug)

Dental Health Professional ConsiderationsErythromycin is known to prolong the QT interval. The QT interval is measured as the time and distance between the Q point of the QRS complex and the end of the T wave in the ECG tracing. After adjustment for heart rate, the QT interval is defined as prolonged if it is more than 450 msec in men and 460 msec in women. A long QT syndrome was first described in the 1950s and 60s as a congenital syndrome involving QT interval prolongation and syncope and sudden death. Some of the congenital long QT syndromes were characterized by a peculiar electrocardiographic appearance of the QRS complex involving a premature atria beat followed by a pause, then a subsequent sinus beat showing marked QT prolongation and deformity. This type of cardiac arrhythmia was originally termed “torsade de pointes” (translated from the French as “twisting of the points”).

Prolongation of the QT interval is thought to result from delayed ventricular repolarization. The repolarization process within the myocardial cell is due to the efflux of intracellular potassium. The channels associated with this current can be blocked by many drugs and predispose the electrical propagation cycle to torsade de pointes.

Erythromycin is considered as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. It is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution.

Many patients cannot tolerate erythromycin because of abdominal pain and nausea; the mechanism of this adverse effect appears to be the motilin agonistic properties of erythromycin in the GI tract. For these patients, clindamycin is indicated as the alternative antibiotic for treatment of orofacial infections.

HMG-CoA reductase inhibitors, also known as the statins, effectively decrease the hepatic cholesterol biosynthesis resulting in the reduction of blood LDL-cholesterol concentrations. The AUC of atorvastatin (Lipitor®) was increased 33% by erythromycin administration. Combination of erythromycin and lovastatin (Mevacor®) has been associated with rhabdomyolysis (Ayanian, et al). The mechanism of erythromycin is inhibiting the CYP3A4 metabolism of atorvastatin, lovastatin, and cerivastatin. Simvastatin (Zocor®) would likely be affected in a similar manner by the coadministration of erythromycin. Clarithromycin (Biaxin®) may exert a similar effect as erythromycin on atorvastatin, lovastatin, cerivastatin, and simvastatin.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Oral candidiasis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsErythromycin is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution. See Dental Comment.

Mental Health: Effects on Mental StatusSystemic: Macrolides have been reported to cause nightmares, confusion, anxiety, and mood lability

Mental Health: Effects on Psychiatric TreatmentSystemic: Contraindicated with pimozide; may increase concentration of bromocriptine, carbamazepine, and triazolam

Cardiovascular ConsiderationsErythromycin, when used with drugs that affect the QT interval (eg, cisapride, quinidine) or when administered to patients with a prolonged QT interval, may further increase the QT interval and the risk of torsade de pointes (proarrhythmias).

Anesthesia and Critical Care Concerns/Other ConsiderationsErythromycin, when used with drugs that affect the QT interval (eg, cisapride, ergot derivatives, pimozide) or when administered to patients with a prolonged QT interval, may further increase the QT interval and the risk of torsade de pointes (proarrhythmias).

Index TermsErythromycin Base; Erythromycin Ethylsuccinate; Erythromycin Lactobionate; Erythromycin Stearate

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Lexapro® may be confused with Loxitane®

Pronunciation(es sye TAL oh pram)

U.S. Brand NamesLexapro®

Canadian Brand NamesCipralex®

Pharmacologic CategoryAntidepressant, Selective Serotonin Reuptake Inhibitor

Use: Labeled IndicationsTreatment of major depressive disorder; generalized anxiety disorders (GAD)

Use: Unlabeled/Investigational

Treatment of mild dementia-associated agitation in nonpsychotic patients

Dosing: AdultsMajor depressive disorder, generalized anxiety disorder: Oral: Initial: 10 mg/day; dose may be increased to 20 mg/day after at least 1 week

Dosing: ElderlyDepression: Oral: 10 mg once daily

Dosing: Renal Impairment

Mild-to-moderate impairment: No dosage adjustment needed.

Severe impairment: Cl_{cr} <20 mL/minute: Use with caution.

Dosing: Hepatic Impairment10 mg/day

Administration: OralAdminister once daily (morning or evening), with or without food.

Dietary ConsiderationsMay be taken with or without food.

StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).

RestrictionsAn FDA-approved medication guide concerning the use of antidepressants in children, adolescents, and young adults must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm. Dispense to parents or guardians of children and adolescents receiving this medication.

ContraindicationsHypersensitivity to escitalopram, citalopram, or any component of the formulation; concomitant use with pimozide; concomitant use or within 2 weeks of MAO inhibitors

Allergy Considerations

- Selective Serotonin Reuptake Inhibitor (SSRI) Allergy

Warnings/Precautions

Boxed warnings:

- Suicidal thinking/behavior: See “Major psychiatric warnings” below.

Major psychiatric warnings:

- **[U.S. Boxed Warning]: Antidepressants increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 years of age) with major depressive disorder (MDD) and other psychiatric disorders;** consider risk prior to prescribing. Short-term studies did not show an increased risk in patients >24 years of age and showed a decreased risk in patients ≥65 years. Closely monitor patients for clinical worsening, suicidality, or unusual changes in behavior, particularly during the initial 1-2 months of therapy or during periods of dosage adjustments (increases or decreases); the patient’s family or caregiver should be instructed to closely observe the patient and communicate condition with healthcare provider. A medication guide concerning the use of antidepressants should be dispensed with each prescription. **Escitalopram is not FDA approved for use in children.**

- The possibility of a suicide attempt is inherent in major depression and may persist until remission occurs. Patients treated with antidepressants should be observed for clinical worsening and suicidality, especially during the initial few months of a course of drug therapy, or at times of dose changes, either increases or decreases. Worsening depression and severe abrupt suicidality that are not part of the presenting symptoms may require discontinuation or modification of drug therapy. Use caution in high-risk patients during initiation of therapy.

- Prescriptions should be written for the smallest quantity consistent with good patient care. The patient's family or caregiver should be alerted to monitor patients for the emergence of suicidality and associated behaviors such as anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, and mania; patients should be instructed to notify their healthcare provider if any of these symptoms or worsening depression or psychosis occur.

- May worsen psychosis in some patients or precipitate a shift to mania or hypomania in patients with bipolar disorder. Monotherapy in patients with bipolar disorder should be avoided. Patients presenting with depressive symptoms should be screened for bipolar disorder. **Escitalopram is not FDA approved for the treatment of bipolar depression.**

Concerns related to adverse effects:

- Anticholinergic effects: Relatively devoid of these side effects.
- Bleeding risk: May impair platelet aggregation resulting in increased risk of bleeding events (including GI bleeding), particularly if used concomitantly with aspirin, NSAIDs, warfarin, or other anticoagulants. Bleeding related to SSRI or SNRI use has been reported to range from relatively minor bruising and epistaxis to life-threatening hemorrhage.
- CNS depression: Has a low potential to impair cognitive or motor performance; caution operating hazardous machinery or driving.
- Sexual dysfunction: May cause or exacerbate sexual dysfunction.
- SIADH and hyponatremia: SSRIs and SNRIs have been associated with the development of SIADH; hyponatremia has been reported rarely (including severe cases with serum sodium <110 mmol/L), predominately in the elderly. Hyponatremia is reversible with discontinuation of treatment. Volume depletion and/or concurrent use of diuretics likely increases risk.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; clearance is decreased and plasma concentrations are increased; a lower dosage may be needed.
- Renal impairment: Use with caution in patients with renal impairment.
- Seizure disorders: Use with caution in patients with a previous seizure disorder or condition predisposing to seizures such as brain damage or alcoholism.

Concurrent drug therapy issues:

- Agents which lower seizure threshold: Concurrent therapy with other drugs which lower the seizure threshold.
- Anticoagulants/Antiplatelets: Use caution with concomitant use of aspirin, NSAIDs, warfarin, or other drugs that affect coagulation; the risk of bleeding may be potentiated.
- CNS depressants: Use caution with concomitant therapy.
- MAO inhibitors: Potential for severe reaction when used with MAO inhibitors; autonomic instability, coma, death, delirium, diaphoresis, hyperthermia, mental status changes/agitation, muscular rigidity, myoclonus, neuroleptic malignant syndrome features, and seizures may occur.
- Serotonin syndrome: Symptoms of agitation, confusion, hallucinations, hyper-reflexia, myoclonus, shivering, and tachycardia may occur with concomitant proserotonergic drugs (ie, SSRIs/SNRIs or triptans) or agents which reduce escitalopram's metabolism. Concurrent use of serotonin precursors (eg, tryptophan) is not recommended.

Special populations:

- Elderly: Use caution in elderly patients; risk of hyponatremia and other adverse events may be increased. Bioavailability and half-life are increased by 50% in the elderly.
- Pediatrics: Safety and efficacy in children have not been established.
- Pregnancy: Use caution in pregnant patients; high doses of citalopram have been associated with teratogenicity in animals.

Other warnings/precautions:

- Electroconvulsive therapy (ECT): Use with caution; no clinical studies have assessed the combined use of escitalopram and electroconvulsive therapy; may increase the risks (eg, cognitive adverse effects) associated with electroconvulsive therapy; consider discontinuing, when possible, prior to ECT treatment.
- Withdrawal syndrome: May cause dysphoric mood, irritability, agitation, dizziness, sensory disturbances, anxiety, confusion, headache, lethargy, emotional lability, insomnia, hypomania, tinnitus, and seizures. Upon discontinuation of escitalopram therapy, gradually taper dose. If intolerable symptoms occur following a decrease in dosage or upon discontinuation of therapy, then resuming the previous dose with a more gradual taper should be considered.

Geriatric ConsiderationsBioavailability and half-life are increased by 50% in the elderly. The elderly are more prone to SSRI/SNRI-induced hyponatremia.

Pregnancy Risk FactorC

Pregnancy ConsiderationsDue to adverse effects observed in animal studies, escitalopram is classified as pregnancy category C. Escitalopram is distributed into the amniotic fluid. Limited data is available concerning the use of escitalopram during pregnancy. Nonteratogenic effects in the newborn following SSRI exposure late in the third trimester include respiratory distress, cyanosis, apnea, seizures, temperature instability, feeding difficulty, vomiting, hypoglycemia, hypo- or hypertonia, hyper-reflexia, jitteriness, irritability, constant crying, and tremor. An increased risk of low birth weight and lower APGAR scores have also been reported. Exposure to SSRIs after the twentieth week of gestation has been associated with persistent pulmonary hypertension of the newborn (PPHN). Adverse effects may be due to toxic effects of the SSRI or drug withdrawal without a taper. The long-term effects of *in utero* SSRI exposure on infant development and behavior are not known. Escitalopram is the S-enantiomer of the racemic derivative citalopram; also refer to the Citalopram monograph.

Women treated for major depression and who are euthymic prior to pregnancy are more likely to experience a relapse when medication is discontinued as compared to pregnant women who continue taking antidepressant medications. The ACOG recommends that therapy with

SSRIs or SNRIs during pregnancy be individualized; treatment of depression during pregnancy should incorporate the clinical expertise of the mental health clinician, obstetrician, primary healthcare provider, and pediatrician (ACOG, 2007). If treatment during pregnancy is required, consider tapering therapy during the third trimester in order to prevent withdrawal symptoms in the infant. If this is done and the woman is considered to be at risk from her major depressive disorder, the medication can be restarted following delivery, although the dose should be readjusted to that required before pregnancy.

LactationEnters breast milk/consider risk:benefit

Breast-Feeding ConsiderationsEscitalopram and its metabolite are excreted into breast milk. Limited data is available concerning the effects escitalopram may have in the nursing infant and the long-term effects on development and behavior have not been studied. According to the manufacturer, the decision to continue or discontinue breast-feeding during therapy should take into account the risk of exposure to the infant and the benefits of treatment to the mother. Escitalopram is the S-enantiomer of the racemic derivative citalopram; also refer to the Citalopram monograph.

Adverse Reactions

>10%:

Central nervous system: Headache (24%), somnolence (6% to 13%), insomnia (9% to 12%)

Gastrointestinal: Nausea (15% to 18%)

Genitourinary: Ejaculation disorder (9% to 14%)

1% to 10%:

Cardiovascular: Chest pain, hypertension, palpitation

Central nervous system: Fatigue (5% to 8%), dizziness (5%), dreaming abnormal (3%), lethargy (1% to 3%), yawning (2%), concentration impaired, fever, irritability, lightheadedness, migraine

Dermatologic: Rash

Endocrine & metabolic: Libido decreased (3% to 7%), anorgasmia (2% to 6%), menstrual disorder (2%), hot flashes, menstrual cramps

Gastrointestinal: Xerostomia (6% to 9%), diarrhea (8%), constipation (3% to 5%), appetite decreased (3%), indigestion (3%), vomiting (3%), abdominal pain (2%), flatulence (2%), toothache (2%), abdominal cramps, appetite increased, gastroenteritis, heartburn, weight gain

Genitourinary: Impotence (2% to 3%), urinary tract infection, urinary frequency

Neuromuscular & skeletal: Neck/shoulder pain (3%), paresthesia (2%), arthralgia, limb pain, muscle cramp, myalgia

Ocular: Blurred vision

Otic: Earache, tinnitus

Respiratory: Rhinitis (5%), sinusitis (3%), bronchitis, cough, nasal or sinus congestion, sinus headache

Miscellaneous: Diaphoresis (4% to 5%), flu-like syndrome (5%), allergy

<1% (Limited to important or life threatening): Abdominal discomfort, agitation, amnesia, anaphylaxis, anemia, anxiety attack, apathy, arthritis, arthropathy, asthma, auditory hallucination, back discomfort, bilirubin increased, bradycardia, bruxism, carpal tunnel syndrome, chest tightness, chills, confusion, conjunctivitis, coordination abnormal, depersonalization, depression aggravated, depression, dermatitis, disorientation, dyspepsia, dyspnea, dysuria, ECG abnormal, eczema, edema, emotional lability, excitability, eye infection, flushing, folliculitis, furunculosis, gastritis, GERD, gout, hematoma, hematuria, hypercholesterolemia, hyperglycemia, hyper-reflexia, kidney stone, leg pain, lipoma, liver enzymes increased, malaise, menorrhagia, muscle contractions (involuntary), muscle stiffness, muscle weakness, muscular tone increased, nervousness, nosebleed, panic reaction, pneumonia, pruritus, pupils dilated, restless legs, restlessness aggravated, shaking, spotting between menses, suicidal tendency, suicide attempt, syncope, tachycardia, taste alteration, tics, tracheitis, tremor, tremulousness nervous, twitching, urinary urgency, varicose vein, vertigo, vision abnormal, visual disturbance, weakness, weight loss

Postmarketing and/or case reports: Acute renal failure, aggression, akathisia, allergic reaction, angioedema, atrial fibrillation, choreoathetosis, delirium, delusion, diplopia, dyskinesia, dystonia, ecchymosis, erythema multiforme, glaucoma, grand mal seizure, hallucination, hemolytic anemia, hepatic necrosis, hepatitis, INR increased, liver failure, myocardial infarction, neuroleptic malignant syndrome, nystagmus, pancreatitis, priapism, prolactinemia, prothrombin decreased, pulmonary embolism, QT prolonged, rhabdomyolysis, serotonin syndrome, SIADH, spontaneous abortion, Stevens-Johnson syndrome, thrombocytopenia, thrombosis, torsade de pointes, toxic epidermal necrolysis, ventricular arrhythmia, withdrawal syndrome

Metabolism/Transport Effects**Substrate** (major) of CYP2C19, 3A4; **Inhibits** CYP2D6 (weak)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alpha-/Beta-Blockers: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Alpha-/Beta-Blockers. *Risk C: Monitor therapy*

Analgesics (Opioid): May enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Anticoagulants: Antiplatelet Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Serotonin Reuptake Inhibitor/Antagonist): Selective Serotonin Reuptake Inhibitors may enhance the serotonergic effect of Antidepressants (Serotonin Reuptake Inhibitor/Antagonist). This may cause serotonin syndrome. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the anticoagulant effect of other Antiplatelet Agents. *Risk C: Monitor therapy*

Aspirin: Selective Serotonin Reuptake Inhibitors may enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Beta-Blockers: Selective Serotonin Reuptake Inhibitors may enhance the bradycardic effect of Beta-Blockers. **Exceptions:** Acebutolol; Atenolol; Carteolol; Esmolol; Levobunolol; Metipranolol; Nadolol; Penbutolol. *Risk C: Monitor therapy*

BusPIRone: May enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. Selective Serotonin Reuptake Inhibitors may decrease the metabolism of BusPIRone. *Risk C: Monitor therapy*

CarBAMazepine: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of CarBAMazepine. Specifically those SSRIs that inhibit CYP3A4 isoenzymes. CarBAMazepine may increase the metabolism of Selective Serotonin Reuptake Inhibitors. Specifically those agents metabolized via CYP1A2, 2C, and/or 3A4 isoenzymes. *Risk D: Consider therapy modification*

Cimetidine: May decrease the metabolism of Selective Serotonin Reuptake Inhibitors. *Risk D: Consider therapy modification*

Clozapine: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Clozapine. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2C19 Inducers (Strong): May increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Moderate): May decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Strong): May decrease the metabolism of CYP2C19 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Cyproheptadine: May diminish the therapeutic effect of Selective Serotonin Reuptake Inhibitors. *Risk C: Monitor therapy*

Dasatinib: May enhance the anticoagulant effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Desmopressin: Selective Serotonin Reuptake Inhibitors may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Dextromethorphan: Selective Serotonin Reuptake Inhibitors may enhance the adverse/toxic effect of Dextromethorphan. *Risk D: Consider therapy modification*

Drotrecogin Alfa: Antiplatelet Agents may enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Haloperidol: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Haloperidol. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Antiplatelet Agents. Bleeding may occur. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Ibritumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to impaired platelet function and an increased risk of bleeding. *Risk C: Monitor therapy*

Iobenguane I 123: Selective Serotonin Reuptake Inhibitors may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Lithium: Selective Serotonin Reuptake Inhibitors may enhance the adverse/toxic effect of Lithium. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Selective Serotonin Reuptake Inhibitors. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk X: Avoid combination*

Methadone: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Methadone. Fluvoxamine appears to be the only interacting SSRI. *Risk D: Consider therapy modification*

Mexiletine: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Mexiletine. *Risk D: Consider therapy modification*

NSAID (COX-2 Inhibitor): Selective Serotonin Reuptake Inhibitors may enhance the antiplatelet effect of NSAID (COX-2 Inhibitor). *Risk D: Consider therapy modification*

NSAID (Nonselective): Selective Serotonin Reuptake Inhibitors may enhance the antiplatelet effect of NSAID (Nonselective). *Risk D: Consider therapy modification*

Omega-3-Acid Ethyl Esters: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the adverse/toxic effect of Antiplatelet Agents. Specifically, the risk of bleeding may be increased by concurrent use of these agents. *Risk C: Monitor therapy*

Phenytoin: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Phenytoin. *Risk D: Consider therapy modification*

Pimozide: Selective Serotonin Reuptake Inhibitors may enhance the adverse/toxic effect of Pimozide. *Risk X: Avoid combination*

Propafenone: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Propafenone. *Risk D: Consider therapy modification*

Prostacyclin Analogues: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Risperidone: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Risperidone. *Risk C: Monitor therapy*

Salicylates: Antiplatelet Agents may enhance the adverse/toxic effect of Salicylates. Increased risk of bleeding may result. *Risk C: Monitor therapy*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Thrombolytic Agents: Antiplatelet Agents may enhance the anticoagulant effect of Thrombolytic Agents. *Risk C: Monitor therapy*

Tositumomab and Iodine I 131 Tositumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse events may be increased. *Risk C: Monitor therapy*

TraMADol: Selective Serotonin Reuptake Inhibitors may enhance the neuroexcitatory and/or seizure-potentiating effect of TraMADol. TraMADol may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk D: Consider therapy modification*

Tricyclic Antidepressants: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Tryptophan: May enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Selective Serotonin Reuptake Inhibitors may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid valerian, St John's wort, SAMe, kava kava, and gotu kola (may increase CNS depression).

Monitoring ParametersMental status for depression, suicidal ideation (especially at the beginning of therapy or when doses are increased or decreased), anxiety, social functioning, mania, panic attacks; akathisia

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking (eg, MAO inhibitors and other SSRIs). Assess therapeutic effectiveness and adverse reactions at the beginning of therapy and on a regular basis throughout therapy (eg, suicidal ideation, mania, hypomania, anxiety, or panic attacks). Teach patient proper use, possible side effects, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationDo not take any new medication during therapy without consulting prescriber. Take exactly as directed; do not alter dose or discontinue without consulting prescriber (effects of medication may take up to 3 weeks to occur). Avoid other stimulants: caffeine or alcohol. May cause dizziness, lightheadedness, insomnia, impaired concentration, headache (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, loss or increase of appetite, indigestion, or heartburn (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); constipation (increased dietary fluid, fruit, fiber, and increased exercise may help); sexual dysfunction (reversible when drug is discontinued); hot flashes or menstrual cramps; or muscle pain, cramps, or tremor (consult prescriber for approved analgesia). Report immediately any CNS changes such as increased depression, confusion, impaired concentration, severe headache, insomnia, nightmares, irritability, acute anxiety, panic attacks, or thoughts of suicide; persistent GI changes; chest pain or palpitations; blurred vision or vision changes; ringing in ears; unusual cough; or other persistent adverse effects.
Pregnancy/breast-feeding precautions: Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, oral:

Lexapro®: 1 mg/mL (240 mL) [contains propylene glycol; peppermint flavor]

Tablet:

Lexapro®: 5 mg, 10 mg, 20 mg

Note: Cipralex® [CAN] is available only in 10 mg and 20 mg strengths.

Generic AvailableNo

ManufacturerForest Pharmaceuticals, Inc

Pricing: U.S. (www.drugstore.com)

Solution (Lexapro)

5 mg/5 mL (240): $140.86

Tablets (Lexapro)

5 mg (30): $82.99

10 mg (30): $85.99

20 mg (30): $89.99

Mechanism of ActionEscitalopram is the S-enantiomer of the racemic derivative citalopram, which selectively inhibits the reuptake of serotonin with little to no effect on norepinephrine or dopamine reuptake. It has no or very low affinity for 5-HT$_{1-7}$, alpha- and beta-adrenergic, D$_{1-5}$, H$_{1-3}$, M$_{1-5}$, and benzodiazepine receptors. Escitalopram does not bind to or has low affinity for Na^{+}, K^{+}, Cl^{-}, and Ca^{++} ion channels.

Pharmacodynamics/Kinetics

Onset of action: Depression: The onset of action is within a week, however, individual response varies greatly and full response may not be seen until 8-12 weeks after initiation of treatment.

Protein binding: 56% to plasma proteins

Metabolism: Hepatic via CYP2C19 and 3A4 to an active metabolite, S-desmethylcitalopram (S-DCT; 1/7 the activity); S-DCT is metabolized to S-didesmethylcitalopram (S-DDCT; active; 1/27 the activity) via CYP2D6

Half-life elimination: Escitalopram: 27-32 hours; S-desmethylcitalopram: 59 hours

Time to peak: Escitalopram: ~5 hours; S-desmethylcitalopram: 14 hours

Excretion: Urine (Escitalopram: 8%; S-DCT: 10%)

Clearance: Total body: 37-40 L/hour; Renal: Escitalopram: 2.7 L/hour; S-desmethylcitalopram: 6.9 L/hour

Pharmacotherapy PearlsThe tablet and oral solution dosage forms are bioequivalent. Clinically, escitalopram 20 mg is equipotent to citalopram 40 mg. Do not coadminister with citalopram.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation) and toothache

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsAlthough caution should be used in patients taking tricyclic antidepressants, no interactions have been reported with vasoconstrictors and escitalopram, a nontricyclic antidepressant which acts to increase serotonin; no precautions appear to be needed

Mental Health CommentThe SSRIs as a class are generally considered to be safe and equally effective. Allow sufficient dose-response time (6-12 weeks). Differences lie in approved indications, receptor profiles, pharmacokinetics, and cytochrome P450 activity profile. Subtle differences exist in adverse effect profiles. All SSRIs have the potential to cause sexual dysfunction. Escitalopram is the s-isomer of citalopram and therefore, similar to citalopram. Among the SSRIs, escitalopram possesses the lowest effects on CYP isoenzymes.

Index TermsEscitalopram Oxalate; Lu-26-054; S-Citalopram

Esmolol

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Esmolol may be confused with Osmitrol®

Brevibloc® may be confused with bretylium, Brevital®, Bumex®, Buprenex®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(ES moe lol)

U.S. Brand NamesBrevibloc®

Canadian Brand NamesBrevibloc®

Pharmacologic CategoryAntiarrhythmic Agent, Class II; Beta Blocker, Beta$_1$ Selective

Use: Labeled IndicationsTreatment of supraventricular tachycardia (SVT) and atrial fibrillation/flutter (control ventricular rate); treatment of tachycardia and/or hypertension (especially intraoperative or postoperative); treatment of noncompensatory sinus tachycardia

Use: Unlabeled/InvestigationalIn children, for SVT and postoperative hypertension

Dosing: Adults **Infusion requires an infusion pump** (must be adjusted to individual response and tolerance):

Intraoperative tachycardia and/or hypertension (immediate control): I.V.: Initial bolus: 80 mg (~1 mg/kg) over 30 seconds, followed by a 150 mcg/kg/minute infusion, if necessary. Adjust infusion rate as needed to maintain desired heart rate and/or blood pressure, up to 300 mcg/kg/minute.

For control of postoperative hypertension, as many as one-third of patients may require higher doses (250-300 mcg/kg/minute) to control blood pressure; the safety of doses >300 mcg/kg/minute has not been studied.

Supraventricular tachycardia or gradual control of postoperative tachycardia/hypertension: I.V.: Loading dose: 500 mcg/kg over 1 minute; follow with a 50 mcg/kg/minute infusion for 4 minutes; response to this initial infusion rate may be a rough indication of the responsiveness of the ventricular rate.

Infusion may be continued at 50 mcg/kg/minute or, if the response is inadequate, titrated upward in 50 mcg/kg/minute increments (increased no more frequently than every 4 minutes) to a maximum of 200 mcg/kg/minute.

Note: To achieve more rapid response, following the initial loading dose and 50 mcg/kg/minute infusion, rebolus with a second 500 mcg/kg loading dose over 1 minute, and increase the maintenance infusion to 100 mcg/kg/minute for 4 minutes. If necessary, a third (and final) 500 mcg/kg loading dose may be administered, prior to increasing to an infusion rate of 150 mcg/kg/minute. After 4 minutes of the 150 mcg/kg/minute infusion, the infusion rate may be increased to a maximum rate of 200 mcg/kg/minute (without a bolus dose).

Supraventricular tachycardias (SVT); usual dose range: Usual dosage range: 50-200 mcg/kg/minute with average dose of 100 mcg/kg/minute.

Guidelines for transfer to oral therapy (beta-blocker, calcium channel blocker):

Infusion should be reduced by 50% 30 minutes following the first dose of the alternative agent

Manufacturer suggests following the second dose of the alternative drug, patient's response should be monitored and if control is adequate for the first hours, esmolol may be discontinued.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Supraventricular tachycardias (unlabeled use): I.V.: A limited amount of information regarding esmolol use in pediatric patients is currently available. Some centers have utilized doses of 100-500 mcg/kg given over 1 minute for control of supraventricular tachycardias.

Postoperative hypertension (unlabeled use): I.V.: Loading doses of 500 mcg/kg/minute over 1 minute with maximal doses of 50-250 mcg/kg/minute (mean = 173) have been used in addition to nitroprusside to treat postoperative hypertension after coarctation of aorta repair.

Dosing: Renal ImpairmentNot removed by hemo- or peritoneal dialysis. Supplemental dose is not necessary.

Calculations

- Esmolol

Administration: I.V.The 250 mg/mL ampul is **not** for direct I.V. injection, but rather must first be diluted to a final concentration of 10 mg/mL (ie, 2.5 g in 250 mL or 5 g in 500 mL). Concentrations >10 mg/mL or infusion into small veins or through a butterfly catheter should be avoided (can cause thrombophlebitis).

Administration: I.V. DetailInfusions must be administered with an infusion pump. Decrease or discontinue infusion if hypotension, congestive heart failure occur.

pH: 3.5-5.5 (concentrate); 4.5-5.5 (ready to use)

StorageClear, colorless to light yellow solution which should be stored at 15°C to 30°C (59°F to 85°F); do not freeze. Protect fromexcessive heat.

CompatibilityStable in D_5LR, $D_5{}^1/_2$NS, D_5NS, D_5W, D_5W with KCl 40 mEq/L, LR, ${}^1/_2$NS, NS.

Y-site administration: Compatible: Amikacin, aminophylline, amiodarone, ampicillin, atracurium, butorphanol, calcium chloride, cefazolin, cefoperazone, ceftazidime, ceftizoxime, chloramphenicol, cimetidine, cisatracurium, clindamycin, diltiazem, dopamine, enalaprilat, erythromycin lactobionate, famotidine, fentanyl, gatifloxacin, gentamicin, heparin, hydrocortisone sodium succinate, insulin (regular), labetalol, linezolid, magnesium sulfate, methyldopate, metronidazole, midazolam, morphine, nafcillin, nitroglycerin, norepinephrine, pancuronium, penicillin G potassium, phenytoin, piperacillin, polymyxin B sulfate, potassium chloride, potassium phosphates, propofol, ranitidine, remifentanil, sodium acetate, sodium nitroprusside, streptomycin, tacrolimus, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vecuronium. **Incompatible:** Amphotericin B cholesteryl sulfate complex, furosemide, warfarin.

Compatibility when admixed: Compatible: Aminophylline, atracurium, bretylium, digoxin, dopamine, heparin, lidocaine. **Incompatible:** Diazepam, procainamide, sodium bicarbonate, thiopental.

ContraindicationsHypersensitivity to esmolol or any component of the formulation; sinus bradycardia; heart block greater than first degree (except in patients with a functioning artificial pacemaker); cardiogenic shock; bronchial asthma (relative); uncompensated cardiac failure; hypotension; pregnancy (2nd and 3rd trimesters)

Allergy Considerations

- Beta-Blocker Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactic reactions: Use caution with history of severe anaphylaxis to allergens; patients taking beta-blockers may become more sensitive to repeated challenges. Treatment of anaphylaxis (eg, epinephrine) in patients taking beta-blockers may be ineffective or promote undesirable effects.
- Hypotension: Can commonly occur; patients need close blood pressure monitoring.
- Skin necrosis: Extravasation can lead to skin necrosis and sloughing.

Disease-related concerns:

- Bronchospastic disease: In general, patients with bronchospastic disease should not receive beta-blockers; however, esmolol, with B_1 selectivity, has been used cautiously with close monitoring.
- Conduction abnormality: Consider pre-existing conditions such as sick sinus syndrome before initiating.
- Diabetes: Use with caution in patients with diabetes mellitus; may potentiate hypoglycemia and/or mask signs and symptoms.
- Heart failure (HF): Use with caution in patients with compensated heart failure and monitor for a worsening of the condition.
- Myasthenia gravis: Use with caution in patients with myasthenia gravis.
- Peripheral vascular disease (PVD): Use with caution in patients with PVD (including Raynaud's).
- Pheochromocytoma (untreated): Adequate alpha-blockade is required prior to use of any beta-blocker.
- Psychiatric disease: Use with caution in patients with a history of psychiatric illness; may cause or exacerbate CNS depression.
- Renal impairment: Use with caution in patients with renal impairment; active metabolite retained.

Concurrent drug therapy issues:

- Calcium channel blockers: Use with caution in patients on concurrent verapamil or diltiazem; bradycardia or heart block can occur. Avoid concurrent I.V. use of both agents.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Administration: Concentrations >10 mg/mL or infusion into small veins or through a butterfly catheter should be avoided; can cause thrombophlebitis.
- Abrupt withdrawal: Beta-blocker therapy should not be withdrawn abruptly (particularly in patients with CAD), but gradually tapered to avoid acute tachycardia, hypertension, and/or ischemia.
- Hypertension associated with hypothermia: Do not use in the treatment of hypertension associated with vasoconstriction related to hypothermia.

Geriatric ConsiderationsDue to alterations in the beta-adrenergic autonomic nervous system, beta-adrenergic blockade may result in less hemodynamic response than seen in younger adults. Studies indicate that despite decreased sensitivity to the chronotropic effects of beta-blockade with age, there appears to be an increased myocardial sensitivity to the negative inotropic effect during stress (ie, exercise). Controlled trials have shown the overall response rate for propranolol to be only 20% to 50% in elderly populations. Therefore, all beta-adrenergic blocking drugs may result in a decreased response as compared to younger adults.

Pregnancy Risk FactorC (manufacturer); D (2nd and 3rd trimesters - expert analysis)

Pregnancy ConsiderationsTeratogenic effects are not noted in animal studies. Fetal bradycardia can occur when administered in the 3rd trimester of pregnancy or at delivery.

LactationExcretion in breast milk unknown/use with caution

Adverse Reactions

>10%:

Cardiovascular: Asymptomatic hypotension (dose related: 25% to 38%), symptomatic hypotension (dose related: 12%)

Miscellaneous: Diaphoresis (10%)

1% to 10%:

Cardiovascular: Peripheral ischemia (1%)

Central nervous system: Dizziness (3%), somnolence (3%), confusion (2%), headache (2%), agitation (2%), fatigue (1%)

Gastrointestinal: Nausea (7%), vomiting (1%)

Local: Pain on injection (8%), infusion site reaction

<1% (Limited to important or life-threatening): Abdominal discomfort, abnormal thinking, acne, alopecia, anorexia, anxiety, bradycardia, bronchospasm, chest pain, CHF, constipation, depression, dyspepsia, dyspnea, eczema, edema, erythema, exfoliative dermatitis, fever, flushing, heart block, lightheadedness, midcapsular pain, nasal congestion, pallor, paresthesia, pruritus, psoriasis, pulmonary edema, rigors, seizure, severe bradycardia/asystole (rare), skin discoloration, skin irritation, skin necrosis (from extravasation), syncope, taste perversion, thrombophlebitis, urinary retention, vision change, weakness, wheezing, xerostomia

Drug Interactions

Acetylcholinesterase Inhibitors: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): Beta-Blockers may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Epinephrine used as a local anesthetic for dental procedures will not likely cause clinically relevant problems. **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha1-Blockers: Beta-Blockers may enhance the orthostatic effect of Alpha1-Blockers. The risk associated with ophthalmic products is probably less than systemic products. *Risk D: Consider therapy modification*

Alpha2-Agonists: Beta-Blockers may enhance the rebound hypertensive effect of Alpha2-Agonists. This effect can occur when the alpha$_2$-agonist is abruptly withdrawn. **Exceptions:** Apraclonidine; Brimonidine. *Risk D: Consider therapy modification*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Aminoquinolines (Antimalarial): May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Amiodarone: May enhance the bradycardic effect of Beta-Blockers. Possibly to the point of cardiac arrest. Amiodarone may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Anilidopiperidine Opioids: May enhance the bradycardic effect of Beta-Blockers. Anilidopiperidine Opioids may enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Beta-Blockers. Beta-Blockers may decrease the metabolism of Antipsychotic Agents (Phenothiazines). Antipsychotic Agents (Phenothiazines) may decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Barbiturates: May decrease the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Beta2-Agonists: Beta-Blockers (Beta1 Selective) may diminish the bronchodilatory effect of Beta2-Agonists. Of particular concern with nonselective beta-blockers or higher doses of the beta1 selective beta-blockers. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May enhance the hypotensive effect of Beta-Blockers. Bradycardia and signs of heart failure have also been reported. Calcium Channel Blockers (Nondihydropyridine) may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Cardiac Glycosides: Beta-Blockers may enhance the bradycardic effect of Cardiac Glycosides. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Dipyridamole: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Disopyramide: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Insulin: Beta-Blockers may enhance the hypoglycemic effect of Insulin. *Risk C: Monitor therapy*

Lidocaine: Beta-Blockers may decrease the metabolism of Lidocaine. *Risk C: Monitor therapy*

Methacholine: Beta-Blockers may enhance the adverse/toxic effect of Methacholine. *Risk X: Avoid combination*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Midodrine: Beta-Blockers may enhance the bradycardic effect of Midodrine. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Propafenone: May decrease the metabolism of Beta-Blockers. Propafenone possesses some independent beta blocking activity. *Risk C: Monitor therapy*

Propoxyphene: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

QuiNIDine: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Reserpine: May enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Beta-Blockers. **Exceptions:** Rifabutin. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Theophylline Derivatives: Beta-Blockers (Beta1 Selective) may diminish the bronchodilatory effect of Theophylline Derivatives. This is true at higher beta-blockers doses where cardioselectivity is lost. *Risk C: Monitor therapy*

Test InteractionsIncreases cholesterol (S), glucose

Monitoring ParametersBlood pressure, heart rate, MAP, ECG, respiratory rate, I.V. site; cardiac monitor and blood pressure monitor required

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Requires continuous cardiac, hemodynamic, and infusion site monitoring (extravasation). If you have diabetes, may mask signs of hypoglycemia. Monitor blood sugars closely. Monitor therapeutic effectiveness and adverse reactions.

Patient EducationEsmolol is administered in emergencies, patient education should be appropriate to the situation. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Infusion [premixed in sodium chloride; preservative free]:

Brevibloc®: 2000 mg (100 mL) [20 mg/mL; double strength]; 2500 mg (250 mL) [10 mg/mL]

Injection, solution, as hydrochloride: 10 mg/mL (10 mL)

Brevibloc®:

10 mg/mL (10 mL) [alcohol free; premixed in sodium chloride]

20 mg/mL (5 mL, 100 mL) [alcohol free; double strength; premixed in sodium chloride]

250 mg/mL (10 mL) [contains alcohol 25%, propylene glycol 25%; concentrate] [DSC]

Generic AvailableYes: Excludes infusion

Mechanism of ActionClass II antiarrhythmic: Competitively blocks response to beta$_1$-adrenergic stimulation with little or no effect of beta$_2$-receptors except at high doses, no intrinsic sympathomimetic activity, no membrane stabilizing activity

Pharmacodynamics/Kinetics

Onset of action: Beta-blockade: I.V.: 2-10 minutes (quickest when loading doses are administered)

Duration of hemodynamic effects: 10-30 minutes; prolonged following higher cumulative doses, extended duration of use

Protein binding: 55%

Metabolism: In blood by red blood cell esterases

Half-life elimination: Adults: 9 minutes; elimination of metabolite decreases with end stage renal disease

Excretion: Urine (~69% as metabolites, 2% unchanged drug)

- Beta-Blockers
- Hypertension

Dental Health: Effects on Dental TreatmentEsmolol is a cardioselective beta-blocker. Local anesthetic with vasoconstrictor can be safely used in patients medicated with esmolol. Nonselective beta-blockers (ie, propranolol, nadolol) enhance the pressor response to epinephrine, resulting in hypertension and bradycardia; this has not been reported for esmolol. Many nonsteroidal anti-inflammatory drugs, such as ibuprofen and indomethacin, can reduce the hypotensive effect of beta-blockers after 3 or more weeks of therapy with the NSAID. Short-term NSAID use (ie, 3 days) requires no special precautions in patients taking beta-blockers.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness, confusion, fatigue, or depression

Mental Health: Effects on Psychiatric TreatmentBarbiturates may decease effects of esmolol

Cardiovascular ConsiderationsEsmolol provides an important mechanism for close titration of rate control in patients with atrial fibrillation. Esmolol may also be beneficial in allowing close blood pressure control. Esmolol should only be administered in intensive care or closely monitored situations. Potential adverse effects include hypotension and bradyarrhythmias. These are usually short-lived because of esmolol's short half-life (9 minutes).

Anesthesia and Critical Care Concerns/Other ConsiderationsEsmolol 250 mg/mL contains propylene glycol 258 mg/mL (25% v/v).

This agent is also used to blunt sympathetic response during intubation, in “at-risk” patients such as those with coronary artery disease (CAD), angina, uncontrolled hypertension, and hyperthyroidism. Esmolol may lose beta$_1$ specificity after higher doses. It should be used with caution in patients with pulmonary disease and diabetes.

Esmolol provides an important mechanism for close titration of rate control in patients with atrial fibrillation; may also be beneficial in allowing close blood pressure control. Esmolol should only be administered in intensive care or closely monitored situations. Potential adverse effects include hypotension and bradyarrhythmias (usually short-lived due to short half-life of 9 minutes).

Proton Pump Inhibitors (Esomeprazole, Omeprazole): Evidence Does Not Suggest Increased Rates of Cardiac Events - Results of FDA Analysis - Updated, February 2008

The U.S. Food and Drug Administration (FDA) and Health Canada reviews of esomeprazole (Nexium®) and omeprazole (Prilosec® [U.S.]/Losec® [CAN]) find no evidence of increased risk of cardiac events related to these medications. In May 2007, AstraZeneca, the manufacturer of Nexium® (esomeprazole) and Prilosec® (U.S.)/Losec® (CAN) (omeprazole), notified both regulatory agencies of concerns regarding a possible association between long-term use of esomeprazole or omeprazole and cardiovascular side effects based on the results of two small, nonblinded, long-term, European clinical trials of patients with GERD. Patients in these trials were randomized to antireflux surgery (fundoplication) or esomeprazole or omeprazole treatment. In these trials, initial data suggested that patients using either of these proton pump inhibitors experienced more heart attacks, heart failure, and cardiac deaths than patients who had surgery. As a result, the FDA and Health Canada issued public notifications regarding these results in August 2007.

The FDA and Health Canada evaluated the two studies, other published trials, and an analysis of postmarketing safety data from the FDA and WHO since that time, and issued independent statements saying that preliminary reviews do not confirm the existence of cardiovascular risk. Upon further analysis of additional information submitted to the FDA and Health Canada by the manufacturer, both regulatory agencies have confirmed their respective preliminary reviews of the evidence, and are recommending that healthcare providers continue to prescribe (and patients continue to use) these products as described within their labeling.

For more information, healthcare professionals may refer to the following FDA and Health Canada websites:

Nexium® may be confused with Nexavar®

Pronunciation(es oh ME pray zol)

U.S. Brand NamesNexium®

Canadian Brand NamesNexium®

Pharmacologic CategoryProton Pump Inhibitor; Substituted Benzimidazole

Use: Labeled Indications

Oral: Short-term (4-8 weeks) treatment of erosive esophagitis; maintaining symptom resolution and healing of erosive esophagitis; treatment of symptomatic gastroesophageal reflux disease (GERD); as part of a multidrug regimen for *Helicobacter pylori* eradication in patients with duodenal ulcer disease (active or history of within the past 5 years); prevention of gastric ulcers in patients at risk (age ≥60 years and/or history of gastric ulcer) associated with continuous NSAID therapy; long-term treatment of pathological hypersecretory conditions including Zollinger-Ellison syndrome

Canadian labeling: Additional use (not in U.S. labeling): Oral: Treatment of nonerosive reflux disease (NERD)

I.V.: Short-term (≤10 days) treatment of gastroesophageal reflux disease (GERD) when oral therapy is not possible or appropriate

Dosing: Adults

Erosive esophagitis (healing): Oral: Initial: 20-40 mg once daily for 4-8 weeks; if incomplete healing, may continue for an additional 4-8 weeks; maintenance: 20 mg once daily

Maintenance of healing of erosive esophagitis: Oral: 20 mg once daily; clinical trials evaluated therapy for ≤6 months

Nonerosive reflux disease (NERD) (Canadian labeling): Initial: 20 mg once daily for 2-4 weeks; lack of symptom control after 4 weeks warrants further evaluation; maintenance (in patients with successful initial therapy): 20 mg once daily as needed

Symptomatic gastroesophageal reflux: Oral: 20 mg once daily for 4 weeks; may consider an additional 4 weeks of treatment if symptoms do not resolve

Treatment of GERD (short-term): I.V.: 20 mg or 40 mg once daily for ≤10 days; change to oral therapy as soon as appropriate

Peptic ulcer disease: Eradication of*Helicobacter pylori*: Oral: 40 mg once daily for 10 days; requires combination therapy. **Note:** Various regimens available:

Canadian labeling: 20 mg twice daily for 7 days; requires combination therapy

Prevention of NSAID-induced gastric ulcers: 20-40 mg once daily for up to 6 months

Treatment of NSAID-induced gastric ulcers (Canadian labeling): 20 mg once daily for 4-8 weeks.

Pathological hypersecretory conditions (Zollinger-Ellison syndrome): 40 mg twice daily; adjust regimen to individual patient needs; doses up to 240 mg/day have been administered

Dosing: ElderlyRefer to adult dosing. No dosage adjustment needed.

Dosing: Pediatric

Children 1-11 years: Oral: **Note:** Safety and efficacy of doses >1 mg/kg/day and/or therapy beyond 8 weeks have not been established.

Symptomatic GERD: 10 mg once daily for up to 8 weeks

Erosive esophagitis (healing):

<20 kg: 10 mg once daily for 8 weeks

≥20 kg: 10-20 mg once daily for 8 weeks

Nonerosive reflux disease (NERD) (Canadian labeling): 10 mg once daily for up to 8 weeks

Adolescents 12-17 years: Oral:

Symptomatic GERD: 20-40 mg once daily for up to 8 weeks

NERD (Canadian labeling): 20 mg once daily for 2-4 weeks

Dosing: Renal ImpairmentNo adjustment is necessary.

Dosing: Hepatic ImpairmentSafety and efficacy not established in children with hepatic impairment.

Mild-to-moderate hepatic impairment (Child-Pugh class A or B): No dosage adjustment needed.

Severe hepatic impairment (Child-Pugh class C): Dose should not exceed 20 mg/day.

Administration: I.V.May be administered by injection (≥3 minutes) or infusion (10-30 minutes). Flush line prior to and after administration with NS, LR, or D_5W.

Administration: I.V. DetailpH: 9-11

Administration: Oral

Capsule: Should be swallowed whole and taken at least 1 hour before eating (best if taken before breakfast). Capsule can be opened and contents mixed with 1 tablespoon of applesauce. Swallow immediately; mixture should not be chewed or warmed. For patients with difficulty swallowing, use of granules may be easiest.

Granules: Empty into container with 1 tablespoon of water and stir; leave 2-3 minutes to thicken. Stir and drink within 30 minutes. If any medicine remains after drinking, add more water, stir and drink immediately.

Tablet (Canadian formulation, not available in U.S.): Swallow whole or may be dispersed in a half a glass of noncarbonated water. Stir until tablets disintegrate, leaving a liquid containing pellets. Drink contents within 30 minutes. Do not chew or crush pellets. After drinking, rinse glass with water and drink.

Administration: OtherNasogastric tube:

Capsule: Open capsule and place intact granules into a 60 mL syringe; mix with 50 mL of water. Replace plunger and shake vigorously for 15 seconds. Ensure that no granules remain in syringe tip. Do not administer if pellets dissolve or disintegrate. Use immediately after preparation. After administration, flush nasogastric tube with additional water.

Granules: Delayed release oral suspension granules can also be given by nasogastric or gastric tube. Add 15 mL of water to a syringe, add granules from packet. Shake the syringe, leave 2-3 minutes to thicken. Shake the syringe and administer through nasogastric or gastric tube (French size 6 or greater) within 30 minutes. Refill the syringe with 15 mL of water, shake and flush nasogastric/gastric tube.

Tablet (Canadian formulation, not available in U.S.): Disperse tablets in 50 mL of noncarbonated water. Stir until tablets disintegrate leaving a liquid containing pellets. After administration, flush with additional 25-50 mL of water to clear the syringe and tube.

Dietary ConsiderationsTake at least 1 hour before meals; best if taken before breakfast. The contents of the capsule may be mixed in applesauce or water; pellets also remain intact when exposed to orange juice, apple juice, and yogurt.

Storage

Capsule, granules: Store at 15°C to 30°C (59°F to 86°F). Keep container tightly closed.

Powder for injection: Store at 15°C to 30°C (59°F to 86°F). Protect from light. Following reconstitution, solution for injection prepared in NS, and solution for infusion prepared in NS or LR should be used within 12 hours. Following reconstitution, solution for infusion prepared in D_5W should be used within 6 hours. Refrigeration is not required following reconstitution.

ReconstitutionPowder for injection:

For I.V. injection: Reconstitute powder with 5 mL NS.

For I.V. infusion: Initially reconstitute powder with 5 mL of NS, LR, or D_5W, then further dilute to a final volume of 50 mL.

ContraindicationsHypersensitivity to esomeprazole, substituted benzimidazoles (ie, lansoprazole, omeprazole, pantoprazole, rabeprazole), or any component of the formulation

Allergy Considerations

- Proton Pump Inhibitor, Benzimidazole Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Atrophic gastritis: Long-term omeprazole therapy has caused atrophic gastritis (by biopsy); this may also occur with esomeprazole.
- Carcinoma: No reports of enterochromaffin-like (ECL) cell carcinoids, dysplasia, or neoplasia have occurred.

Disease-related concerns:

- Gastric malignancy: Relief of symptoms does not preclude the presence of a gastric malignancy.
- Hepatic impairment: Patients with severe liver dysfunction may require dosage reductions.

Dosage form specific issues:

- Intravenous: Safety and efficacy of I.V. treatment beyond 10 days have not been established; transition from I.V. to oral therapy as soon possible.

Geriatric ConsiderationsDose adjustment is not necessary.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. However, there are no adequate and well-controlled studies in pregnant women. Congenital abnormalities have been reported sporadically following omeprazole use during pregnancy.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsEsomeprazole excretion into breast milk has not been studied. However, omeprazole is excreted in breast milk, and therefore considered likely that esomeprazole is similarly excreted; breast-feeding is not recommended.

Adverse ReactionsUnless otherwise specified, percentages represent adverse reactions identified in clinical trials evaluating the oral formulation.

>10%: Central nervous system: Headache (I.V. 11%; oral ≤8%)

1% to 10%:

Cardiovascular: Hypertension (≤3%), chest pain (>1%)

Central nervous system: Pain (4%), dizziness (oral >1%; I.V. 3%), anxiety (2%), insomnia (2%), pyrexia (2%), fatigue (>1%)

Dermatologic: Rash (>1%), pruritus (I.V. ≤1%)

Endocrine & metabolic: Hypercholesterolemia (2%)

Gastrointestinal: Flatulence (oral ≤5%; I.V. 10%), diarrhea (oral ≤7%; I.V. 4%), abdominal pain (oral ≤6%; I.V. 6%), nausea (oral 5%; I.V. 6%), dyspepsia (oral > 1%; I.V. 6%), gastritis (≤6%), constipation (oral 2%; I.V. 3%), vomiting (≤3%), benign GI neoplasm (>1%), dyspepsia (>1%), duodenitis (>1%), epigastric pain (>1%), esophageal disorder (>1%), gastroenteritis (>1%), GI mucosal discoloration (>1%), serum gastrin increased (>1%), tooth disorder (>1%), xerostomia (1%)

Genitourinary: Urinary tract infection (4%)

Hematologic: Anemia (>1%)

Hepatic: Transaminases increased (>1%)

Local: Local: Injection site reaction (I.V. 2%)

Neuromuscular & skeletal: Arthralgia (3%), back pain (>1%), fracture (>1%), arthropathy (1%), myalgia (1%)

Respiratory: Respiratory infection (oral ≤9%; I.V. 1%), bronchitis (4%), sinusitis (oral ≤4%; I.V. 2%), coughing (>1%), rhinitis (>1%), dyspnea (1%)

Miscellaneous: Accident/injury (≤8%), viral infection (4%), allergy (2%), ear infection (2%), hernia (>1%), flu-like syndrome (1%)

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Abdominal rigidity, aggression, agitation, agranulocytosis, albuminuria, alkaline phosphatase increased, alopecia, anaphylactic reaction/shock, angioedema, anorexia, arthritis exacerbation, asthma exacerbation, benign polyps/nodules, bilirubinemia, blurred vision, bronchospasm, candidiasis (GI and genital), carcinoid tumor of stomach, cervical lymphadenopathy, conjunctivitis, cramps, creatinine increased, cystitis, dehydration, depression, dermatitis, dysmenorrhea, dysphagia, dysuria, edema (including facial, peripheral and tongue), epigastric pain, epistaxis, erythema multiforme, esophageal varices, fibromyalgia syndrome, flushing, fungal infection, gastric retention, GI dysplasia, glycosuria, goiter, gynecomastia, hallucinations, hematuria, hepatic encephalopathy, hepatic failure, hepatitis, hyperhidrosis, hyperparathyroidism, hypertonia, hyperuricemia, hypoesthesia, hypokalemia, hypomagnesemia, hyponatremia, impotence, interstitial nephritis, jaundice, larynx edema, leukocytosis, leukopenia, malaise, micturition increased, migraine, muscular weakness, nervousness, osteoporosis, otitis media, pancreatitis, pancytopenia, paresthesia, pharyngolaryngeal pain, pharyngitis, photosensitivity, polymyalgia rheumatica, polyuria, proteinuria, pruritus ani, rhinorrhea, rigors, sleep disorder, somnolence, Stevens-Johnson syndrome, stomatitis, tachycardia, taste disturbances, thrombocytopenia, thyroid-stimulating hormone increased, tinnitus, total bilirubin increased, toxic epidermal necrolysis, tremor, urticaria, vaginitis, vertigo, vitamin B_{12} deficiency, weight changes

Metabolism/Transport Effects**Substrate** of CYP2C19 (major), 3A4 (major); **Inhibits** CYP2C19 (moderate)
Drug Interactions

Antifungal Agents (Azole Derivatives, Systemic): Proton Pump Inhibitors may decrease the absorption of Antifungal Agents (Azole Derivatives, Systemic). **Exceptions:** Miconazole. *Risk D: Consider therapy modification*

Atazanavir: Proton Pump Inhibitors may decrease the absorption of Atazanavir. *Risk D: Consider therapy modification*

Benzodiazepines (metabolized by oxidation): Proton Pump Inhibitors may increase the serum concentration of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Clopidogrel: Proton Pump Inhibitors may diminish the therapeutic effect of Clopidogrel. This appears to be due to reduced formation of the active clopidogrel metabolite. *Risk C: Monitor therapy*

CYP2C19 Inducers (Strong): May increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Substrates: CYP2C19 Inhibitors (Moderate) may decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

Dabigatran Etexilate: Proton Pump Inhibitors may decrease the serum concentration of Dabigatran Etexilate. *Risk C: Monitor therapy*

Dasatinib: Proton Pump Inhibitors may decrease the absorption of Dasatinib. *Risk D: Consider therapy modification*

Erlotinib: Proton Pump Inhibitors may decrease the serum concentration of Erlotinib. *Risk X: Avoid combination*

Indinavir: Proton Pump Inhibitors may decrease the absorption of Indinavir. *Risk C: Monitor therapy*

Iron Salts: Proton Pump Inhibitors may decrease the absorption of Iron Salts. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk C: Monitor therapy*

Methotrexate: Proton Pump Inhibitors may decrease the excretion of Methotrexate. Antirheumatic doses of methotrexate probably hold minimal risk. *Risk C: Monitor therapy*

Mycophenolate: Proton Pump Inhibitors may decrease the serum concentration of Mycophenolate. Specifically, concentrations of the active mycophenolic acid may be reduced. *Risk C: Monitor therapy*

Saquinavir: Proton Pump Inhibitors may increase the serum concentration of Saquinavir. *Risk C: Monitor therapy*

Tipranavir: May decrease the serum concentration of Proton Pump Inhibitors. These data are derived from studies with Ritonavir-boosted Tipranavir. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: Absorption is decreased by 43% to 53% when taken with food.
Monitoring ParametersSusceptibility testing recommended in patients who fail *H. pylori* eradication regimen (esomeprazole, clarithromycin, and amoxicillin)
Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions (especially those dependent on cytochrome P450 metabolism or those dependent on an acid environment for absorption). Monitor response and adverse reactions at beginning of therapy and periodically throughout therapy. Assess knowledge/teach appropriate use of this medication, interventions to reduce side effects, and adverse symptoms to report.
Monitoring: Lab TestsSusceptibility testing is recommended in patients who fail *H. pylori* eradication regimen (esomeprazole, clarithromycin, and amoxicillin).
Patient EducationTake as directed, 1 hour before eating at same time each day. Swallow capsule whole; do not crush or chew. If you cannot swallow capsule whole, open capsule, mix contents with 1 tablespoon of applesauce, and swallow immediately; do not chew mixture. Do not store for future use. You may experience headache; constipation (increased exercise, fluids, fruit, or fiber may help); diarrhea (boiled milk, yogurt, or buttermilk may help); or abdominal pain (should diminish with use). Report persistent headache, diarrhea, constipation, abdominal pain, changes in urination or pain on urination, CNS changes, persistent muscular aches or pain, ringing in ears or visual changes, or other adverse reactions. **Breast-feeding precaution:** Breast-feeding is not recommended.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian availability

Note: Strength expressed as base

Capsule, delayed release, as magnesium:

Nexium®: 20 mg, 40 mg

Granules, for oral suspension, delayed release, as magnesium:

Nexium®: 10 mg/packet (30s); 20 mg/packet (30s); 40 mg/packet (30s)

Nexium® [CAN]: 10 mg/packet (28s)

Injection, powder for reconstitution, as sodium:

Nexium®: 20 mg, 40 mg [contains edetate sodium]

Tablet, extended release, as magnesium:

Nexium® [CAN]: 20 mg, 40 mg [not available in U.S.]

Generic AvailableNo
ManufacturerAstraZeneca Pharmaceuticals LP
Pricing: U.S. (www.drugstore.com)

Capsule, delayed release (Nexium)

20 mg (30): $169.25

40 mg (30): $154.99

Mechanism of ActionProton pump inhibitor suppresses gastric acid secretion by inhibition of the H^+/K^+-ATPase in the gastric parietal cell

Pharmacodynamics/Kinetics

Distribution: V_{dss}: 16 L

Protein binding: 97%

Metabolism: Hepatic via CYP2C19 and 3A4 enzymes to hydroxy, desmethyl, and sulfone metabolites (all inactive)

Bioavailability: Oral: 90% with repeat dosing

Half-life elimination: ~1-1.5 hours

Time to peak: Oral: 1.5-2 hours

Excretion: Urine (80%, primarily as inactive metabolites; <1% as active drug); feces (20%)

Pharmacotherapy PearlsEsomeprazole is the S-isomer of omeprazole.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation)

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause headache

Mental Health: Effects on Psychiatric TreatmentThe clearance of diazepam is decreased by 45% with concomitant use, resulting in increased diazepam levels and potential for toxicity; monitor

Anesthesia and Critical Care Concerns/Other Considerations**Acute ulcer: Postendoscopy therapy:** Intravenous omeprazole has been studied in prevention of rebleeding in ulcer patients who are at high risk for rebleeding (endoscopic findings of active bleeding or nonbleeding visible vessel) after successful hemostasis (Lin, 1998; Lau, 2000).

Lin and his group treated 100 ulcer patients (actively bleeding ulcers or ulcers with nonbleeding visible vessels) endoscopically and then randomized them to cimetidine (300 mg bolus followed by 50 mg/hour infusion) or omeprazole (40 mg bolus, ~7 mg/hour infusion) for 72 hours. Patients were discharged on the oral form of the drug arm they were assigned to. The omeprazole group maintained an intragastric pH >6 for about 84% of the infusion duration, while the cimetidine group maintained their pH >6 only about 50% of the time. Rebleeding occurred significantly more often in the cimetidine group.

Lau and his colleagues treated patients with actively bleeding ulcers or ulcers with nonbleeding visible vessels with an epinephrine infusion followed by thermocoagulation. They were then randomized to omeprazole (80 mg bolus followed by a continuous infusion of 8 mg/hour for 72 hours) or placebo. All patients were discharged on oral omeprazole (20 mg/day) for 8 weeks and received *H. pylori* treatment if indicated. The primary goal was to evaluate the rate of rebleeding during the first 30 days after endoscopy. Two hundred and forty patients were enrolled with randomization of 120 into each group. Bleeding recurred in significantly more patients receiving placebo than omeprazole infusion. The authors concluded that after endoscopic therapy, omeprazole reduces the risk of rebleeding in patients with actively bleeding ulcers or ulcers with nonbleeding visible vessels.

Acute ulcer: Pre-endoscopy therapy: Lau and associates (2007) evaluated the effects of preemptive infusion of omeprazole before endoscopy in upper gastrointestinal bleeding. Consecutive patients (638) were stabilized and then randomly assigned to intravenous omeprazole (80 mg bolus followed by a continuous infusion of 8 mg/hour) or placebo infusion before endoscopy the next morning. The primary endpoint was the need for endoscopic therapy (eg, epinephrine, thermocoagulation). Seven patients were excluded from the analysis. The need for endoscopic treatment was significantly lower in the omeprazole group (60/314 patients; 19%) than in the placebo group (90/317; 28%). The active treatment group had a significantly shorter hospital stay. Duration of infusion before endoscopy was similar in both groups (~8-21 hours).

Stress ulcer prophylaxis: The 2008 Surviving Sepsis Campaign guidelines recommend that stress ulcer prophylaxis using an H_2 blocker (Grade 1A) or proton pump inhibitor (Grade 1B) be given to patients with severe sepsis to prevent upper GI bleed. Benefit of prevention of upper GI bleed must be weighed against potential effect of increased stomach pH on development of ventilator-associated pneumonia.

Index TermsEsomeprazole Magnesium; Esomeprazole Sodium

Medication Safety Issues

Sound-alike/look-alike issues:

ProSom® may be confused with PhosLo®, Proscar®, Pro-Sof® Plus, Prozac®, Psorcon®

Pronunciation(es TA zoe lam)
U.S. Brand NamesProSom® [DSC]
Pharmacologic CategoryBenzodiazepine
Use: Labeled IndicationsShort-term management of insomnia
Dosing: AdultsInsomnia: Oral: 1 mg at bedtime, some patients may require 2 mg; start at doses of 0.5 mg in debilitated patients.
Dosing: ElderlyStart at doses of 0.5 mg in small elderly patients.
Dosing: Hepatic ImpairmentAdjustment may be necessary.
RestrictionsC-IV
ContraindicationsHypersensitivity to estazolam or any component of the formulation (cross-sensitivity with other benzodiazepines may exist); pregnancy

Note: Manufacturer states concurrent therapy with itraconazole or ketoconazole is contraindicated.

Allergy Considerations

- Benzodiazepine Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anterograde amnesia: Benzodiazepines have been associated with anterograde amnesia.
- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Hypersensitivity reactions: Postmarketing studies have indicated that the use of hypnotic/sedative agents for sleep has been associated with hypersensitivity reactions including anaphylaxis as well as angioedema.
- Paradoxical reactions: Paradoxical reactions, including hyperactive or aggressive behavior, have been reported with benzodiazepines, particularly in adolescent/pediatric or psychiatric patients.
- Sleep-related activities: An increased risk for hazardous sleep-related activities such as sleep-driving; cooking and eating food, and making phone calls while asleep have also been noted.

Disease-related concerns:

- Depression: Use caution in patients with depression, particularly if suicidal risk may be present.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Impaired gag reflux: Use with caution in patients with an impaired gag reflux.
- Renal impairment: Use with caution in patients with renal impairment.
- Respiratory disease: Use with caution in patients with respiratory disease.

Concurrent drug therapy issues:

- CNS depressants/psychoactive medications: Use with caution in patients receiving other CNS depressants or psychoactive medication; effects with other sedative drugs or ethanol may be potentiated.
- High potential for interactions: Use with caution in patients taking strong CYP3A4 inhibitors, moderate or strong CYP3A4 inducers and major CYP3A4 substrates (see Drug Interactions); consider alternative agents that avoid or lessen the potential for CYP-mediated interactions.

Special populations:

- Debilitated patients: Use with caution in debilitated patients.

- Elderly: Use with caution in the elderly; benzodiazepines have been associated with falls and traumatic injury.

- Fall risk: Use with extreme caution in patients who are at risk of falls; benzodiazepines have been associated with falls and traumatic injury.

Other warning/precautions:

- Appropriate use: Does not have analgesic, antidepressant, or antipsychotic properties.

- Hypnotic: Appropriate use: As a hypnotic, should be used only after evaluation of potential causes of sleep disturbance. Failure of sleep disturbance to resolve after 7-10 days may indicate psychiatric or medical illness.

- Withdrawal: Rebound or withdrawal symptoms may occur following abrupt discontinuation or large decreases in dose. Use caution when reducing dose or withdrawing therapy; decrease slowly and monitor for withdrawal symptoms. Flumazenil may cause withdrawal in patients receiving long-term benzodiazepine therapy.

Geriatric ConsiderationsThere has been little experience with this drug in the elderly, but because of its lack of active metabolites, estazolam would be a reasonable choice for elderly patients when a benzodiazepine hypnotic is indicated.
Pregnancy Risk FactorX
LactationEnters breast milk/contraindicated
Adverse Reactions

>10%:

Central nervous system: Somnolence

Neuromuscular & skeletal: Weakness

1% to 10%:

Cardiovascular: Flushing, palpitation

Central nervous system: Anxiety, confusion, dizziness, hypokinesia, abnormal coordination, hangover effect, agitation, amnesia, apathy, emotional lability, euphoria, hostility, seizure, sleep disorder, stupor, twitch

Dermatologic: Dermatitis, pruritus, rash, urticaria

Gastrointestinal: Xerostomia, constipation, appetite increased/decreased, flatulence, gastritis, perverse taste

Genitourinary: Frequent urination, menstrual cramps, urinary hesitancy, urinary frequency, vaginal discharge/itching

Neuromuscular & skeletal: Paresthesia

Ocular: Photophobia, eye pain, eye swelling

Respiratory: Cough, dyspnea, asthma, rhinitis, sinusitis

Miscellaneous: Diaphoresis

<1%: Allergic reactions, chills, drug dependence, fever, muscle spasm, myalgia, neck pain

Postmarketing and/or case reports: Anaphylaxis, angioedema, complex sleep-related behavior (sleep-driving, cooking or eating food, making phone calls)

Metabolism/Transport Effects**Substrate** of CYP3A4 (minor)
Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Aprepitant: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

CarBAMazepine: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Clozapine: Benzodiazepines may enhance the adverse/toxic effect of Clozapine. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Disulfiram: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Fosaprepitant: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). Specifically, the active metabolite aprepitant is likely responsible for this effect. *Risk C: Monitor therapy*

Grapefruit Juice: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Isoniazid: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Nefazodone: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Oral Contraceptive (Estrogens): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Oral Contraceptive (Progestins): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Phenytoin: Benzodiazepines may increase the serum concentration of Phenytoin. Short-term exposure to benzodiazepines may not present as much risk as chronic therapy. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). Management: Amprenavir, atazanavir, darunavir, indinavir, nelfinavir, ritonavir, and tipranavir are contraindicated with midazolam and triazolam according to each protease inhibitor's prescribing information. *Risk D: Consider therapy modification*

Proton Pump Inhibitors: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). **Exceptions:** Lansoprazole; Pantoprazole; Rabeprazole. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). **Exceptions:** Citalopram; Escitalopram; PARoxetine; Sertraline. *Risk C: Monitor therapy*

St Johns Wort: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Theophylline Derivatives: May diminish the therapeutic effect of Benzodiazepines. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Serum levels and/or toxicity may be increased by grapefruit juice.

Monitoring ParametersRespiratory and cardiovascular status

Nursing: Physical Assessment/MonitoringFor short-term use. Assess effectiveness and interactions of other medications patient may be taking. Assess for history of addiction; long-term use can result in dependence, abuse, or tolerance. Be alert to possibility of anaphylaxis any time during therapy. Evaluate periodically for need for continued use. After long-term use, taper dosage slowly when discontinuing. For inpatient use, institute safety measures and monitor effectiveness and adverse reactions. For outpatients, monitor therapeutic effectiveness and adverse reactions at beginning of therapy and periodically with long-term use. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report. **Pregnancy risk factor X:** Determine that patient is not pregnant before starting therapy. Do not give to sexually-active female patients unless capable of complying with contraceptive use. Breast-feeding is contraindicated.

Monitoring: Lab TestsCBC, liver function with long-term therapy

Patient EducationUse exactly as directed; do not increase dose or frequency or discontinue without consulting prescriber. Drug may cause physical and/or psychological dependence. While using this medication, do not use alcohol or other prescription or OTC medications (especially, pain medications, sedatives, antihistamines, or hypnotics) without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or GI upset (take with water or milk). Report CNS changes (confusion, depression, increased sedation, excitation, headache, abnormal thinking, insomnia, or nightmares); altered voiding patterns or blood in urine; respiratory difficulty, chest pain, or palpitations; unusual swelling, especially on face or neck; altered gait pattern; or ineffectiveness of medication. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant during therapy or for 1 month following therapy. Consult prescriber for instruction on appropriate contraceptive measures. This drug may cause severe fetal defects. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Tablet: 1 mg, 2 mg

ProSom®: 1 mg, 2 mg [DSC]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Estazolam)

1 mg (30): $24.99

2 mg (30): $27.99

Mechanism of ActionBinds to stereospecific benzodiazepine receptors on the postsynaptic GABA neuron at several sites within the central nervous system, including the limbic system, reticular formation. Enhancement of the inhibitory effect of GABA on neuronal excitability results by increased neuronal membrane permeability to chloride ions. This shift in chloride ions results in hyperpolarization (a less excitable state) and stabilization.

Pharmacodynamics/Kinetics

Onset of action: ~1 hour

Duration: Variable

Metabolism: Extensively hepatic

Half-life elimination: 10-24 hours (no significant changes in elderly)

Time to peak, serum: 0.5-1.6 hours

Excretion: Urine (<5% as unchanged drug)

Related Information

- Benzodiazepines
- CMS: Long-Term Care Facility Thresholds
- Discontinuation of Psychotropic Drugs
- Teratogenic Risks of Psychotropic Medications

Pharmacotherapy PearlsAbrupt discontinuation after sustained use (generally >10 days) may cause withdrawal symptoms.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Significant xerostomia (normal salivary flow resumes upon discontinuation)

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health CommentIn 2007, the FDA requested that all manufacturers of sedative-hypnotic drug products revise labeling to include a greater emphasis on the risks of adverse effects. These risks include severe allergic reactions (anaphylaxis, angioedema) and complex sleep-related behaviors, which may include sleep-driving (driving while not fully awake and with no memory of the event), making phone calls, and preparing and eating food while asleep.

There are two subtypes of GABA receptors (GABA-A and GABA-B) and three different benzodiazepine receptors (Bz_1, Bz_2, and Bz_3). Benzodiazepine receptors and effects appear to be linked to the GABA-A receptors. Benzodiazepines do not bind to GABA-B receptors. The role of GABA-B receptors is unclear. Benzodiazepines have no specificity for benzodiazepine receptor subtypes.

Estazolam is a short half-life benzodiazepine. Duration of action after a single dose is determined by redistribution rather than metabolism. Tolerance develops to the sedative, hypnotic, and anticonvulsant effects. It does not develop to the anxiolytic or skeletal muscle relaxing effects. Psychological and physical dependence may occur with prolonged use of benzodiazepines. The onset of withdrawal symptoms is usually seen on the first day without drug and lasts 5-7 days in patients receiving short half-life benzodiazepines, whereas, the onset occurs after 5 days with a duration of 10-14 days after abrupt discontinuance of long half-life benzodiazepines. Risk factors for abuse include personal or family history of substance abuse and personality disorder.

Anesthesia and Critical Care Concerns/Other ConsiderationsAbrupt discontinuation after sustained use (generally >10 days) may cause withdrawal symptoms.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Transdermal patch may contain conducting metal (eg, aluminum); remove patch prior to MRI.

Pronunciation(es tra DYE ole & LEE voe nor jes trel)

U.S. Brand NamesClimaraPro®

Pharmacologic CategoryEstrogen and Progestin Combination

Use: Labeled IndicationsWomen with an intact uterus: Treatment of moderate-to-severe vasomotor symptoms associated with menopause; prevention of postmenopausal osteoporosis

Dosing: Adults

Treatment of moderate-to-severe vasomotor symptoms associated with menopause or prevention of postmenopausal osteoporosis: Adult females with an intact uterus:

Transdermal: Estradiol 0.045 mg/levonorgestrel 0.015 mg: Apply one patch weekly

Dosing: ElderlyRefer to adult dosing.

Administration: TopicalApply once weekly to a clean, dry, fold-free area of the lower abdomen; avoid application to waistline. Do not apply to irritated or broken skin. Do not apply to breasts. Rotate site with each application. Avoid touching adhesive with fingers. Hold system in place for ~10 seconds to ensure proper application. If patch falls off during the week, may reapply same patch or apply a new patch to another area of the lower abdomen. Remove patch slowly to avoid irritating the skin. Allow skin to dry for 15 minutes, then gently rub area with an oil-based cream or lotion if needed to remove any remaining adhesive. Prior to discarding, fold patch so that it sticks to itself.

Dietary ConsiderationsEnsure adequate calcium and vitamin D intake when used for the prevention of osteoporosis.

StorageStore at controlled room temperature of 20°C to 25°C (68°F to 77°F). Pouch should remain sealed until ready to use.

ContraindicationsHypersensitivity to estradiol, levonorgestrel, or any component of the formulation; undiagnosed abnormal vaginal bleeding; history of or current thrombophlebitis or venous thromboembolic disorders (including DVT, PE); active or recent (within 1 year) arterial thromboembolic disease (eg, stroke, MI); carcinoma of the breast; estrogen-dependent tumor; hepatic dysfunction or disease; pregnancy

Allergy Considerations

- Estrogen Allergy

Warnings/Precautions

Boxed warnings:

- Cardiovascular disease: See “Disease-related concerns” below.
- Dementia: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Breast cancer: Estrogens may increase the risk of breast cancer. An increased risk of invasive breast cancer was observed in postmenopausal women using CEE in combination with MPA; a smaller increase in risk was seen with estrogen therapy alone in observational studies. An increase in abnormal mammograms has also been reported with estrogen and progestin therapy. Estrogen use may lead to severe hypercalcemia in patients with breast cancer and bone metastases; discontinue estrogen if hypercalcemia occurs.
- Dementia: **[U.S. Boxed Warning]: The risk of dementia may be increased in postmenopausal women;** increased incidence was observed in women ≥65 years of age taking CEE alone or in combination with MPA.
- Endometrial cancer: Unopposed estrogens may increase the risk of endometrial carcinoma in postmenopausal women. Estrogens may exacerbate endometriosis. Malignant transformation of residual endometrial implants has been reported posthysterectomy with estrogen only therapy.
- Lipid effects: Estrogen compounds are generally associated with lipid effects such as increased HDL-cholesterol and decreased LDL-cholesterol. Triglycerides may also be increased; use with caution in patients with familial defects of lipoprotein metabolism.
- Retinal vascular thrombosis: Estrogens may cause retinal vascular thrombosis; discontinue permanently if papilledema or retinal vascular lesions are observed on examination.

Disease-related concerns:

- Cardiovascular disease: **[U.S. Boxed Warning]: Estrogens with or without progestin should not be used to prevent coronary heart disease.** Use caution with cardiovascular disease or dysfunction. May increase the risks of hypertension, myocardial infarction (MI), stroke, pulmonary emboli (PE), and deep vein thrombosis; incidence of these effects was shown to be significantly increased in postmenopausal women using conjugated equine estrogens (CEE) in combination with medroxyprogesterone acetate (MPA). Nonfatal MI, PE, and thrombophlebitis have also been reported in males taking high doses of CEE (eg, for prostate cancer).

- Cholestatic jaundice: Use caution with history of cholestatic jaundice associated with past estrogen use or pregnancy.
- Diseases exacerbated by fluid retention: Use with caution in patients with diseases which may be exacerbated by fluid retention, including asthma, epilepsy, migraine, diabetes, or renal dysfunction.
- Gallbladder disease: Use with caution in patients with gallbladder disease.
- Hepatic hemangiomas: Use with caution in patients with hepatic hemangiomas.
- Hypocalcemia: Use with caution in patients with severe hypocalcemia.
- Porphyria: Use with caution in patients with porphyria.
- SLE: Use with caution in patients with SLE.

Special populations:

- Premenopausal women: Not for use prior to menopause.
- Surgical patients: Whenever possible, should be discontinued at least 4 weeks prior to and for 2 weeks following elective surgery associated with an increased risk of thromboembolism or during periods of prolonged immobilization.

Dosage form specific issues:

- Transdermal patch: May contain conducting metal (eg, aluminum); remove patch prior to MRI. Following application, avoid exposure of the transdermal patch to prolonged periods of sunlight.

Other warnings/precautions:

- Osteoporosis use: When used solely for the prevention of osteoporosis in women at significant risk, nonestrogen treatment options should be considered.
- Risks vs. benefits: Before prescribing estrogen therapy to postmenopausal women, the risks and benefits must be weighed for each patient. Women should be informed of these risks and benefits, as well as possible effects of progestin when added to estrogen therapy. Estrogens with or without progestin should be used for shortest duration possible consistent with treatment goals. Conduct periodic risk:benefit assessments.

Pregnancy ConsiderationsUse of this combination is contraindicated during pregnancy. Estrogens are not indicated for use during pregnancy or immediately postpartum. Increased risk of fetal reproductive tract disorders and other birth defects have been observed with diethylstilbestrol (DES). Epidemiologic studies have not shown an increased risk of birth defects when levonorgestrel is used prior to pregnancy or inadvertently during early pregnancy, although rare reports of congenital anomalies have been reported. This product is intended to be used only in postmenopausal women.

LactationEnters breast milk/use caution (AAP rates “compatible”)

Breast-Feeding ConsiderationsEstradiol and levonorgestrel are both excreted in breast milk. Estrogen has been shown to decrease the quantity and quality of human milk; use only if clearly needed; monitor the growth of the infant closely.

Adverse ReactionsPercentages reported as greater in ClimaraPro™ when compared to estradiol alone:

>10%:

Central nervous system: Depression (12%)

Endocrine & metabolic: Breast pain (40%)

Genitourinary: Vaginal bleeding (78%)

Local: Application site reaction (86%)

Neuromuscular & skeletal: Back pain (13%)

Respiratory: Upper respiratory tract infection (28%)

1% to 10%: Cardiovascular: Edema (8%)

Other adverse events reported with **estrogen and/or estrogen/progestin** therapy: Abdominal cramps, acne, abnormal uterine bleeding, aggravation of porphyria, amenorrhea, anaphylactoid reactions, anaphylaxis, angioedema, antifactor Xa decreased, antithrombin III decreased, appetite changes, bloating, breast enlargement, breast tenderness, carbohydrate tolerance decreased, cerebral embolism, cerebral thrombosis, chloasma, cholestatic jaundice, cholecystitis, cholelithiasis, chorea, contact lens intolerance, corneal curvature steepening, cystitis-like syndrome, dizziness; factors VII, VIII, IX, X, XII, VII-X complex, and II-VII-X complex increased; endometrial hyperplasia, erythema multiforme, erythema nodosum, galactorrhea, hemorrhagic eruption, fatigue, fibrinogen increased, glucose tolerance impaired, HDL-cholesterol increased, hirsutism, hypertension, gallbladder disease, insomnia, LDL-cholesterol decreased, libido changes, melasma, migraine, nervousness, optic neuritis, pancreatitis, platelet aggregability and platelet count increased, premenstrual-like syndrome, PT and PTT accelerated, pulmonary embolism, pyrexia, retinal thrombosis, scalp hair loss, size of uterine leiomyomata increased, somnolence, thrombophlebitis, thyroid-binding globulin increased, total thyroid hormone (T_4) increased, triglycerides increased, urticaria, vaginal candidiasis, vomiting, weight gain/loss

Metabolism/Transport Effects

Estradiol: **Substrate** of CYP1A2 (major), 2A6 (minor), 2B6 (minor), 2C9 (minor), 2C19 (minor), 2D6 (minor), 2E1 (minor), 3A4 (major); **Inhibits** CYP1A2 (weak), 2C8 (weak); **Induces** CYP3A4 (weak)

Levonorgestrel: **Substrate** of CYP3A4 (major)

Drug Interactions

Acitretin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk X: Avoid combination*

Aminoglutethimide: May increase the metabolism of Progestins. *Risk D: Consider therapy modification*

Aprepitant: May decrease the serum concentration of Contraceptive (Progestins). *Risk D: Consider therapy modification*

Barbiturates: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Benzodiazepines (metabolized by oxidation): Oral Contraceptive (Progestins) may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

CarBAMazepine: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Estrogen Derivatives may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CYP1A2 Inducers (Strong): May increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Felbamate: May decrease the serum concentration of Oral Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Fosaprepitant: May decrease the serum concentration of Contraceptive (Progestins). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Griseofulvin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk X: Avoid combination*

Herbs (Estrogenic Properties): May enhance the adverse/toxic effect of Estrogen Derivatives. *Risk C: Monitor therapy*

Herbs (Progestogenic Properties) (eg, Bloodroot, Yucca): May enhance the adverse/toxic effect of Progestins. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Mycophenolate: May decrease the serum concentration of Oral Contraceptive (Progestins). *Risk D: Consider therapy modification*

OXcarbazepine: May decrease the serum concentration of Oral Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phenytoin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Retinoic Acid Derivatives: May diminish the therapeutic effect of Oral Contraceptive (Progestins). Two forms of contraception are recommended in females of child-bearing potential during retinoic acid derivative therapy. **Exceptions:** Adapalene; Alitretinoin; Tretinoin (Topical). *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Ropinirole: Estrogen Derivatives may increase the serum concentration of Ropinirole. *Risk C: Monitor therapy*

Selegiline: Oral Contraceptive (Progestins) may increase the serum concentration of Selegiline. *Risk D: Consider therapy modification*

Somatropin: Estrogen Derivatives may diminish the therapeutic effect of Somatropin. Shown to be a concern with oral hormone replacement therapy in postmenopausal women. *Risk D: Consider therapy modification*

St Johns Wort: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Thyroid Products: Estrogen Derivatives may diminish the therapeutic effect of Thyroid Products. *Risk C: Monitor therapy*

Tipranavir: Estrogen Derivatives may enhance the dermatologic adverse effect of Tipranavir. The combination of tipranavir/ritonavir and ethinyl estradiol/norethindrone was associated with a high incidence of skin rash. Tipranavir may decrease the serum concentration of Estrogen Derivatives. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Contraceptive (Progestins) may diminish the anticoagulant effect of Vitamin K Antagonists. In contrast, enhanced anticoagulant effects have also been noted with some products. *Risk D: Consider therapy modification*

Voriconazole: May decrease the metabolism of Oral Contraceptive (Progestins). Oral Contraceptive (Progestins) may increase the serum concentration of Voriconazole. *Risk C: Monitor therapy*

Monitoring ParametersYearly physical examination that includes blood pressure and Papanicolaou smear, breast exam, mammogram. Monitor for signs of endometrial cancer. Adequate diagnostic measures, including endometrial sampling, if indicated, should be performed to rule out malignancy in all cases of undiagnosed abnormal vaginal bleeding. Monitor for loss of vision, sudden onset of proptosis, diplopia, migraine; signs and symptoms of thromboembolic disorders; glycemic control in patients with diabetes; lipid profiles in patients being treated for hyperlipidemias; thyroid function in patients on thyroid hormone replacement therapy.

Menopausal symptoms: Assess need for therapy at 3- to 6-month intervals

Prevention of osteoporosis: Bone density measurement

Nursing: Physical Assessment/Monitoring Assess other medications patient may be taking for effectiveness and interactions. Assess results of laboratory tests prior to beginning therapy and regularly during therapy. Before prescribing estrogen therapy to postmenopausal women, the risks and benefits must be weighed for each patient. Women should be informed of these risks and benefits, as well as possible effects of progestin when added to estrogen therapy. Teach patient importance of monthly blood pressure checks, and annual physical assessment, Pap smear, and vision assessment; appropriate use, interventions to reduce side effects (eg, alcohol and smoking cessation), and adverse symptoms to report. Determine that patient is not pregnant before starting therapy.

Monitoring: Lab TestsYearly Papanicolaou smear, mammogram. Monitor for signs of endometrial cancer. Adequate diagnostic measures, including endometrial sampling, if indicated, should be performed to rule out malignancy in all cases of undiagnosed abnormal vaginal bleeding.

Menopausal symptoms: Assess need for therapy at 3- to 6-month intervals

Patient EducationInform prescriber of all prescriptions, OTC medications, or herbal products you are taking, and any allergies you have. Do not take anything new without consulting prescriber. Apply as directed ,once weekly (see below) Annual gynecologic and breast exams are important. May cause nausea or vomiting (small, frequent meals may help); abdominal pain, dizziness or mental depression; headache; breast pain or back pain; increased/decreased libido. Report significant swelling of extremities or weight gain >5 lb/week; sudden acute pain in legs or calves, chest or abdomen; shortness of breath; severe headache or vomiting; sudden blindness; weakness or numbness of arm or leg; unusual vaginal bleeding; yellowing of skin or eyes; or unusual bruising or bleeding. See individual monographs for additional information. **Pregnancy precautions:** Inform prescriber if you are pregnant. Do not get pregnant while taking this drug; may cause fetal defects and should not be used during pregnancy.

Application: Apply weekly to clean, dry skin in fold-free area of lower abdomen; do not apply at waistline. Do not apply to irritated or broken skin. Rotate site each week. Avoid touching adhesive with fingers. Hold patch in place for 10 seconds. If patch falls off during week; reapply same patch or apply a new patch. When changing patch, remove old patch slowly to avoid irritating skin. Allow ski to dry for 15 minutes then rub area gently with an oil-based cream of lotion if needed to remove any remaining adhesive. Fold used patch so that it sticks to itself and discard.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Transdermal system: Estradiol 0.045 mg/24 hours and levonorgestrel 0.015 mg/24 hours (4s) [once-weekly patch; 22 cm^2; contains estradiol 4.4 mg and levonorgestrel 1.39 mg]

ManufacturerBerlex

Pricing: U.S. (www.drugstore.com)

Patch weekly (Climara Pro)

0.045-0.015 mg/day (4): $57.55

Mechanism of ActionEstrogens are responsible for the development and maintenance of the female reproductive system and secondary sexual characteristics. Estradiol is the principle intracellular human estrogen and is more potent than estrone and estriol at the receptor level; it is the primary estrogen secreted prior to menopause. Following menopause, estrone and estrone sulfate are more highly produced. Estrogens modulate the pituitary secretion of gonadotropins, luteinizing hormone, and follicle-stimulating hormone through a negative feedback system; estrogen replacement reduces elevated levels of these hormones in postmenopausal women.

Levonorgestrel inhibits gonadotropin production; when used in this combination, it counteracts the proliferative effects of estradiol on the endometrium.

Pharmacodynamics/Kinetics

Protein binding: Estradiol and levonorgestrel: Bind to sex hormone-binding globulin and albumin

Metabolism:

Estradiol: Hepatic via oxidation and conjugation in GI tract; hydroxylated via CYP3A4 to metabolites; first-pass effect; enterohepatic recirculation; reversibly converted to estrone and estriol

Levonorgestrel: Hepatic involving CYP3A4; undergoes reduction and conjugation followed by hydroxylation; forms metabolites

Half-life elimination: Estradiol: 3 ± 0.67 hours; Levonorgestrel: 28 ± 6.4 hours

Time to peak, serum: Topical: Estradiol (mean): 2-2.5 days; Levonorgestrel: 2.5 days

Excretion:

Estradiol: Primarily urine (as metabolites estrone and estriol); feces (small amounts)

Levonorgestrel: Primarily urine

Related Information

- Estradiol
- Levonorgestrel

Mental Health: Effects on Mental StatusMay cause dizziness, headache, depression, insomnia, nervousness, irritability, and mood disturbances

Mental Health: Effects on Psychiatric TreatmentThe Women's Health Initiative (WHI) Memory Study reported an increased risk of developing dementia in postmenopausal women ≥65 years of age during 4 years of treatment with oral conjugated equine estrogens and medroxyprogesterone acetate relative to placebo (1.8% vs 0.9%). Relative risk was 2.05 (95% CI 1.21-3.48). Therefore, estrogens and progestins should not be used for the prevention of dementia. The WHI also reported an increased risk of stroke (29 vs 21 per 10,000 women-years) compared to women receiving placebo. The increase in risk was observed after the first year and persisted. May cause hypertriglyceridemia; monitor in patients receiving antipsychotics especially clozapine, olanzapine, and quetiapine.

Index TermsLevonorgestrel and Estradiol

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Transdermal patch may contain conducting metal (eg, aluminum); remove patch prior to MRI.

Pronunciation(es tra DYE ole & nor eth IN drone)

U.S. Brand NamesActivella®; CombiPatch®

Canadian Brand NamesEstalis-Sequi®; Estalis®

Pharmacologic CategoryEstrogen and Progestin Combination

Use: Labeled IndicationsWomen with an intact uterus:

Tablet: Treatment of moderate-to-severe vasomotor symptoms associated with menopause; treatment of vulvar and vaginal atrophy; prophylaxis for postmenopausal osteoporosis

Transdermal patch: Treatment of moderate-to-severe vasomotor symptoms associated with menopause; treatment of vulvar and vaginal atrophy; treatment of hypoestrogenism due to hypogonadism, castration, or primary ovarian failure

Dosing: Adults**Note:** Patients should be treated with the lowest effective dose and for the shortest duration, consistent with treatment goals.

Hypoestrogenism: Transdermal (patch):

Continuous combined regimen: Apply one patch twice weekly

Continuous sequential regimen: Apply estradiol-only patch for first 14 days of cycle, followed by one CombiPatch® applied twice weekly for the remaining 14 days of a 28-day cycle.

Osteoporosis, prevention in postmenopausal females (Activella®): Oral: 1 tablet daily

Menopause (moderate-to-severe vasomotor symptoms); vulvar and vaginal atrophy:

Oral (Activella®): 1 tablet daily

Transdermal (patch):

Continuous combined regimen: Apply one patch twice weekly

Continuous sequential regimen: Apply estradiol-only patch for first 14 days of cycle, followed by one CombiPatch® applied twice weekly for the remaining 14 days of a 28-day cycle.

Transdermal patch, combination pack (product-specific dosing for Canadian formulation):

Estalis®: Continuous combined regimen: Apply a new patch twice weekly during a 28-day cycle

Estalis-Sequi®: Continuous sequential regimen: Apply estradiol-only patch (Vivelle®) for first 14 days, followed by one Estalis® patch applied twice weekly during the last 14 days of a 28-day cycle

Note: In women previously receiving oral estrogens, initiate upon reappearance of menopausal symptoms following discontinuation of oral therapy.

Dosing: ElderlyRefer to adult dosing.

Administration: OtherTransdermal patch: Apply to clean dry skin. Do not apply transdermal patch to breasts; apply to lower abdomen, avoiding waistline. Rotate application sites.

ContraindicationsHypersensitivity to estrogens, progestins, or any components; carcinoma of the breast; estrogen-dependent tumor; undiagnosed abnormal vaginal bleeding; history of or current thrombophlebitis or venous thromboembolic disorders (including DVT, PE); active or recent (within 1 year) arterial thromboembolic disease (eg, stroke, MI); hysterectomy; hepatic dysfunction or disease; pregnancy

Allergy Considerations

- Estrogen Allergy

Warnings/Precautions

Boxed warnings:

- Breast cancer: See “Concerns related to adverse effects” below.
- Cardiovascular disease: See “Disease-related concerns” below.

- Dementia: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Breast cancer: **[U.S. Boxed Warning]: Estrogens may increase the risk of breast cancer.** An increased risk of invasive breast cancer was observed in postmenopausal women using CEE in combination with MPA; a smaller increase in risk was seen with estrogen therapy alone in observational studies. An increase in abnormal mammograms has also been reported with estrogen and progestin therapy. Estrogen use may lead to severe hypercalcemia in patients with breast cancer and bone metastases; discontinue estrogen if hypercalcemia occurs.

- Dementia: **[U.S. Boxed Warning]: The risk of dementia may be increased in postmenopausal women;** increased incidence was observed in women ≥65 years of age taking CEE alone or in combination with MPA.

- Endometrial cancer: Unopposed estrogens may increase the risk of endometrial carcinoma in postmenopausal women. Estrogens may exacerbate endometriosis. Malignant transformation of residual endometrial implants has been reported posthysterectomy with estrogen only therapy.

- Lipid effects: Estrogen compounds are generally associated with lipid effects such as increased HDL-cholesterol and decreased LDL-cholesterol. Triglycerides may also be increased; use with caution in patients with familial defects of lipoprotein metabolism.

- Retinal vascular thrombosis: Estrogens may cause retinal vascular thrombosis; discontinue permanently if papilledema or retinal vascular lesions are observed on examination.

Disease-related concerns:

- Cardiovascular disease: **[U.S. Boxed Warning]: Estrogens with or without progestin should not be used to prevent coronary heart disease.** Use caution with cardiovascular disease or dysfunction. May increase the risks of hypertension, myocardial infarction (MI), stroke, pulmonary emboli (PE), and deep vein thrombosis; incidence of these effects was shown to be significantly increased in postmenopausal women using conjugated equine estrogens (CEE) in combination with medroxyprogesterone acetate (MPA). Nonfatal MI, PE, and thrombophlebitis have also been reported in males taking high doses of CEE (eg, for prostate cancer).

- Cholestatic jaundice: Use caution with history of cholestatic jaundice associated with past estrogen use or pregnancy.

- Diseases exacerbated by fluid retention: Use with caution in patients with diseases which may be exacerbated by fluid retention, including asthma, epilepsy, migraine, diabetes, or renal dysfunction.

- Gallbladder disease: Use with caution in patients with gallbladder disease.

- Hepatic hemangiomas: Use with caution in patients with hepatic hemangiomas.

- Hypocalcemia: Use with caution in patients with severe hypocalcemia.

- Porphyria: Use with caution in patients with porphyria.

- SLE: Use with caution in patients with SLE.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

- Surgical patients: Whenever possible, should be discontinued at least 4 weeks prior to and for 2 weeks following elective surgery associated with an increased risk of thromboembolism or during periods of prolonged immobilization.

Dosage form specific issues:

- Transdermal patch: May contain conducting metal (eg, aluminum); remove patch prior to MRI.

Other warnings/precautions:

- Osteoporosis use: When used solely for the prevention of osteoporosis in women at significant risk, nonestrogen treatment options should be considered.

- Risks vs. benefits: Before prescribing estrogen therapy to postmenopausal women, the risks and benefits must be weighed for each patient. Women should be informed of these risks and benefits, as well as possible effects of progestin when added to estrogen therapy. Estrogens with or without progestin should be used for shortest duration possible consistent with treatment goals. Conduct periodic risk:benefit assessments.

- Vulvar and vaginal atrophy use: When used solely for the treatment of vulvar and vaginal atrophy, topical vaginal products should be considered.

Pregnancy ConsiderationsNot for use prior to menopause; use during pregnancy is contraindicated.
LactationEnters breast milk/use caution
Breast-Feeding ConsiderationsEstrogens may decrease the quality and quantity of breast milk.
Adverse ReactionsFrequency not defined.

Cardiovascular: Altered blood pressure, cardiovascular accident, edema, MI, stroke, venous thromboembolism, thrombophlebitis

Central nervous system: Dementia, dizziness, emotional lability, fatigue, headache, insomnia, irritability, mental depression, migraine, mood changes, nervousness, seizure

Dermatologic: Chloasma, erythema multiforme, erythema nodosum, hemorrhagic eruption, hirsutism, itching, loss of scalp hair, melasma, pruritus, seborrhea, skin rash

Endocrine & metabolic: Breast cancer, breast enlargement, breast tenderness, breast pain, fibrocystic breast changes, galactorrhea, hypocalcemia, libido changes, nipple discharge, triglycerides increased

Gastrointestinal: Abdominal pain, bloating, changes in appetite, cramps, flatulence, gallbladder disease, gastroenteritis, nausea, pancreatitis, vomiting, weight gain/loss

Genitourinary: Alterations in frequency and flow of menses, changes in cervical secretions, cystitis-like syndrome, endometrial cancer, endometrial hyperplasia, endometrial thickening, endometriosis exacerbation, genital moniliasis, ovarian cancer, ovarian cyst, postmenopausal bleeding, premenstrual-like syndrome, size of uterine leiomyomata increased, uterine fibroid, vaginal candidiasis, vaginal hemorrhage, vaginitis

Hematologic: Aggravation of porphyria

Hepatic: Cholestatic jaundice

Local: Application site reaction (transdermal patch)

Neuromuscular & skeletal: Arthralgia, back pain, chorea, extremity pain, leg cramps, myalgia, weakness

Ocular: Contact lens intolerance, corneal curvature steepening, retinal vascular thrombosis

Respiratory: Asthma exacerbation, nasopharyngitis, pharyngitis, pulmonary thromboembolism, rhinitis, sinusitis, upper respiratory tract infection

Miscellaneous: Allergic reactions, carbohydrate intolerance, flu-like syndrome, viral infection

Metabolism/Transport Effects

Estradiol: **Substrate** of CYP1A2 (major), 2A6 (minor), 2B6 (minor), 2C9 (minor), 2C19 (minor), 2D6 (minor), 2E1 (minor), 3A4 (major); **Inhibits** CYP1A2 (weak), 2C8 (weak); **Induces** CYP3A4 (weak)

Norethindrone: **Substrate** of CYP3A4 (major); **Induces** CYP2C19 (weak)

Drug Interactions

Acitretin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk X: Avoid combination*

Aminoglutethimide: May increase the metabolism of Progestins. *Risk D: Consider therapy modification*

Aprepitant: May decrease the serum concentration of Contraceptive (Progestins). *Risk D: Consider therapy modification*

Barbiturates: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Benzodiazepines (metabolized by oxidation): Oral Contraceptive (Progestins) may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

CarBAMazepine: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Colesevelam: May decrease the serum concentration of Norethindrone. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Estrogen Derivatives may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CYP1A2 Inducers (Strong): May increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Darunavir: May decrease the serum concentration of Norethindrone. *Risk D: Consider therapy modification*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Felbamate: May decrease the serum concentration of Oral Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Fosaprepitant: May decrease the serum concentration of Contraceptive (Progestins). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Griseofulvin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk X: Avoid combination*

Herbs (Estrogenic Properties): May enhance the adverse/toxic effect of Estrogen Derivatives. *Risk C: Monitor therapy*

Herbs (Progestogenic Properties) (eg, Bloodroot, Yucca): May enhance the adverse/toxic effect of Progestins. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Mycophenolate: May decrease the serum concentration of Oral Contraceptive (Progestins). *Risk D: Consider therapy modification*

OXcarbazepine: May decrease the serum concentration of Oral Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phenytoin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Retinoic Acid Derivatives: May diminish the therapeutic effect of Oral Contraceptive (Progestins). Two forms of contraception are recommended in females of child-bearing potential during retinoic acid derivative therapy. **Exceptions:** Adapalene; Alitretinoin; Tretinoin (Topical). *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Ropinirole: Estrogen Derivatives may increase the serum concentration of Ropinirole. *Risk C: Monitor therapy*

Rufinamide: May decrease the serum concentration of Norethindrone. *Risk D: Consider therapy modification*

Selegiline: Oral Contraceptive (Progestins) may increase the serum concentration of Selegiline. *Risk D: Consider therapy modification*

Somatropin: Estrogen Derivatives may diminish the therapeutic effect of Somatropin. Shown to be a concern with oral hormone replacement therapy in postmenopausal women. *Risk D: Consider therapy modification*

St Johns Wort: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Thyroid Products: Estrogen Derivatives may diminish the therapeutic effect of Thyroid Products. *Risk C: Monitor therapy*

Tipranavir: Estrogen Derivatives may enhance the dermatologic adverse effect of Tipranavir. The combination of tipranavir/ritonavir and ethinyl estradiol/norethindrone was associated with a high incidence of skin rash. Tipranavir may decrease the serum concentration of Estrogen Derivatives. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Contraceptive (Progestins) may diminish the anticoagulant effect of Vitamin K Antagonists. In contrast, enhanced anticoagulant effects have also been noted with some products. *Risk D: Consider therapy modification*

Voriconazole: May decrease the metabolism of Oral Contraceptive (Progestins). Oral Contraceptive (Progestins) may increase the serum concentration of Voriconazole. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (routine use increases estrogen level and risk of breast cancer). Ethanol may also increase the risk of osteoporosis.

Food: Folic acid absorption may be decreased

Herb/Nutraceutical: St John's wort may decrease estradiol levels. Avoid black cohosh, dong quai (has estrogenic activity). Avoid red clover, saw palmetto, ginseng.

Monitoring ParametersRoutine physical examination that includes blood pressure and Papanicolaou smear, breast exam, mammogram. Monitor for signs of endometrial cancer. Adequate diagnostic measures, including endometrial sampling, if indicated, should be performed to rule out malignancy in all cases of undiagnosed abnormal vaginal bleeding. Monitor for loss of vision, sudden onset of proptosis, diplopia, migraine; signs and symptoms of thromboembolic disorders; glycemic control in patients with diabetes; lipid profiles in patients being treated for hyperlipidemias; thyroid function in patients on thyroid hormone replacement therapy.

Menopausal symptoms: Assess need for therapy at 3- to 6-month intervals

Prevention of osteoporosis: Bone density measurement

Nursing: Physical Assessment/MonitoringSee individual agents.

Patient EducationSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Combination pack:

Estalis-Sequi® 140/50 [CAN; not available in U.S.]:

Transdermal system (Vivelle®): Estradiol 50 mcg per day (4s) [14.5 sq cm; total estradiol 4.33 mg]

Transdermal system (Estalis®): Norethindrone acetate 140 mcg and estradiol 50 mcg per day (4s) [9 sq cm; total norethindrone acetate 2.7 mg, total estradiol 0.62 mg; not available in U.S.]

Estalis-Sequi® 250/50 [CAN; not available in U.S.]:

Transdermal system (Vivelle®): Estradiol 50 mcg per day (4s) [14.5 sq cm; total estradiol 4.33 mg]

Transdermal system (Estalis®): Norethindrone acetate 250 mcg and estradiol 50 mcg per day (4s) [16 sq cm; total norethindrone acetate 4.8 mg, total estradiol 0.51 mg; not available in U.S.]

Tablet:

Activella® 0.5/0.1: Estradiol 0.5 mg and norethindrone acetate 0.1mg (28s)

Activella® 1/0.5: Estradiol 1 mg and norethindrone acetate 0.5 mg (28s)

Transdermal system:

CombiPatch®:

0.05/0.14: Estradiol 0.05 mg and norethindrone acetate 0.14 mg per day (8s) [9 sq cm]

0.05/0.25: Estradiol 0.05 mg and norethindrone acetate 0.25 mg per day (8s) [16 sq cm]

Estalis® [CAN]:

140/50: Norethindrone acetate 140 mcg and estradiol 50 mcg per day (8s) [9 sq cm; total norethindrone acetate 2.7 mg, total estradiol 0.62 mg; not available in U.S.]

250/50 Norethindrone acetate 250 mcg and estradiol 50 mcg per day (8s) [16 sq cm; total norethindrone acetate 4.8 mg, total estradiol 0.51 mg; not available in U.S.]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Patch, twice-weekly (CombiPatch)

0.05-0.14 mg/day (8): $55.99

0.05-0.25 mg/day (8): $55.99

Tablets (Activella)

0.5-0.1 mg (28): $56.17

1-0.5 mg (28): $67.03

Pharmacodynamics/Kinetics

Activella®:

Bioavailability: Estradiol: 50%; Norethindrone: 100%

Half-life elimination: Estradiol: 12-14 hours; Norethindrone: 8-11 hours

Time to peak: Estradiol: 5-8 hours

See individual agents.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, headache, depression, insomnia, nervousness, irritability, and mood disturbances

Mental Health: Effects on Psychiatric TreatmentThe Women's Health Initiative (WHI) Memory Study reported an increased risk of developing dementia in postmenopausal women ≥65 years of age during 4 years of treatment with oral conjugated equine estrogens and medroxyprogesterone acetate relative to placebo (1.8% vs 0.9%). Relative risk was 2.05 (95% CI 1.21-3.48). Therefore, estrogens and progestins should not be used for the prevention of dementia. The WHI also reported an increased risk of stroke (29 vs 21 per 10,000 women-years) compared to women receiving placebo. The increase in risk was observed after the first year and persisted. May cause hypertriglyceridemia; monitor in patients receiving antipsychotics especially clozapine, olanzapine, and quetiapine.

Index TermsNorethindrone and Estradiol

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(es tra DYE ole & nor JES ti mate)

U.S. Brand NamesPrefest™

Pharmacologic CategoryEstrogen and Progestin Combination

Use: Labeled IndicationsWomen with an intact uterus: Treatment of moderate to severe vasomotor symptoms associated with menopause; treatment of atrophic vaginitis; prevention of osteoporosis

Dosing: AdultsFemales with an intact uterus:

Treatment of menopausal symptoms, atrophic vaginitis, prevention of osteoporosis: Oral: Treatment is cyclical and consists of the following: One tablet of estradiol 1 mg (pink tablet) once daily for 3 days, followed by 1 tablet of estradiol 1 mg and norgestimate 0.09 mg (white tablet) once daily for 3 days; repeat sequence continuously. **Note:** This dose may not be the lowest effective combination for these indications. In case of a missed tablet, restart therapy with next available tablet in sequence (taking only 1 tablet each day).

Dosing: ElderlyRefer to adult dosing.

Administration: OralIn case of a missed tablet, restart therapy with next available tablet in sequence (taking only 1 tablet each day).

Dietary ConsiderationsEnsure adequate calcium and vitamin D intake when used for the prevention of osteoporosis.

StorageStore at 25°C (77°F).

ContraindicationsHypersensitivity to estradiol, norgestimate, or any component of the formulation; undiagnosed abnormal vaginal bleeding; history of or current thrombophlebitis or venous thromboembolic disorders (including DVT, PE); active or recent (within 1 year) arterial thromboembolic disease (eg, stroke, MI); carcinoma of the breast; estrogen-dependent tumor; hepatic dysfunction or disease; pregnancy

Allergy Considerations

- Estrogen Allergy

Warnings/Precautions

Boxed warnings:

- Cardiovascular disease: See “Disease-related concerns” below.

- Dementia: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Breast cancer: Estrogens may increase the risk of breast cancer. An increased risk of invasive breast cancer was observed in postmenopausal women using CEE in combination with MPA; a smaller increase in risk was seen with estrogen therapy alone in observational studies. An increase in abnormal mammograms has also been reported with estrogen and progestin therapy. Estrogen use may lead to severe hypercalcemia in patients with breast cancer and bone metastases; discontinue estrogen if hypercalcemia occurs.

- Dementia: **[U.S. Boxed Warning]: The risk of dementia may be increased in postmenopausal women;** increased incidence was observed in women ≥65 years of age taking CEE alone or in combination with MPA.

- Endometrial cancer: Unopposed estrogens may increase the risk of endometrial carcinoma in postmenopausal women. Estrogens may exacerbate endometriosis. Malignant transformation of residual endometrial implants has been reported posthysterectomy with estrogen only therapy.

- Lipid effects: Estrogen compounds are generally associated with lipid effects such as increased HDL-cholesterol and decreased LDL-cholesterol. Triglycerides may also be increased; use with caution in patients with familial defects of lipoprotein metabolism.

- Retinal vascular thrombosis: Estrogens may cause retinal vascular thrombosis; discontinue permanently if papilledema or retinal vascular lesions are observed on examination.

Disease-related concerns:

- Cardiovascular disease: **[U.S. Boxed Warning]: Estrogens with or without progestin should not be used to prevent coronary heart disease.** Use caution with cardiovascular disease or dysfunction. May increase the risks of hypertension, myocardial infarction (MI), stroke, pulmonary emboli (PE), and deep vein thrombosis; incidence of these effects was shown to be significantly increased in postmenopausal women using conjugated equine estrogens (CEE) in combination with medroxyprogesterone acetate (MPA). Nonfatal MI, PE, and thrombophlebitis have also been reported in males taking high doses of CEE (eg, for prostate cancer).

- Cholestatic jaundice: Use caution with history of cholestatic jaundice associated with past estrogen use or pregnancy.

- Diseases exacerbated by fluid retention: Use with caution in patients with diseases which may be exacerbated by fluid retention, including asthma, epilepsy, migraine, diabetes, or renal dysfunction.

- Gallbladder disease: Use with caution in patients with gallbladder disease.
- Hepatic hemangiomas: Use with caution in patients with hepatic hemangiomas.
- Hypocalcemia: Use with caution in patients with severe hypocalcemia.
- Porphyria: Use with caution in patients with porphyria.
- SLE: Use with caution in patients with SLE.

Special populations:

- Premenopausal women: Not for use prior to menopause.
- Surgical patients: Whenever possible, should be discontinued at least 4 weeks prior to and for 2 weeks following elective surgery associated with an increased risk of thromboembolism or during periods of prolonged immobilization.

Other warnings/precautions:

- Osteoporosis use: When used solely for the prevention of osteoporosis in women at significant risk, nonestrogen treatment options should be considered.
- Risks vs. benefits: Before prescribing estrogen therapy to postmenopausal women, the risks and benefits must be weighed for each patient. Women should be informed of these risks and benefits, as well as possible effects of progestin when added to estrogen therapy. Estrogens with or without progestin should be used for shortest duration possible consistent with treatment goals. Conduct periodic risk:benefit assessments.
- Vulvar and vaginal atrophy use: When used solely for the treatment of vulvar and vaginal atrophy, topical vaginal products should be considered.

Geriatric ConsiderationsSee Estradiol monograph.
Pregnancy Risk FactorX
Pregnancy ConsiderationsEstrogens are not indicated for use during pregnancy or immediately postpartum. Increased risk of fetal reproductive tract disorders and other birth defects have been observed with diethylstilbestrol (DES); do not use during pregnancy. Progestins are associated with fetal genital abnormalities when used during the first trimester; not recommended for use during pregnancy.
LactationEnters breast milk/use caution
Breast-Feeding ConsiderationsEstrogens and progestins are excreted in breast milk. Estrogens decrease the quality and quantity of breast milk.
Adverse Reactions

>10%:

Central nervous system: Headache (23%)

Endocrine & metabolic: Breast pain (16%)

Gastrointestinal: Abdominal pain (12%)

Neuromuscular & skeletal: Back pain (12%)

Respiratory: Upper respiratory tract infection (21%)

Miscellaneous: Flu-like syndrome (11%)

1% to 10%:

Central nervous system: Fatigue (6%), pain (6%), depression (5%), dizziness (5%)

Endocrine & metabolic: Vaginal bleeding (9%), dysmenorrhea (8%), vaginitis (7%)

Gastrointestinal: Nausea (6%), flatulence (5%)

Neuromuscular & skeletal: Arthralgia (9%), myalgia (5%)

Respiratory: Sinusitis (8%), pharyngitis (7%), cough (5%)

Miscellaneous: Viral infection (6%)

Additional adverse effects associated with **estrogens and progestins**; frequency not defined:

Cardiovascular: Edema, hypertension, MI, stroke, venous thrombosis

Central nervous system: Anxiety, epilepsy exacerbation, insomnia, irritability, migraine, mood disturbances, nervousness, pyrexia, somnolence

Dermatologic: Acne, chloasma, erythema multiforme, erythema nodosum, hemorrhagic eruptions, hirsutism, itching, melasma, pruritus, rash, scalp hair loss, urticaria

Endocrine & metabolic: Amenorrhea, breast cancer, breast discharge, breast enlargement, Breast tenderness, carbohydrate tolerance decreased, endometrial cancer, endometrial hyperplasia, fibrocystic breast changes, galactorrhea, hypocalcemia, libido changes, ovarian cancer, triglycerides increased

Gastrointestinal: Abdominal cramps, appetite changes, bloating, gallbladder disease, pancreatitis, vomiting, weight gain/loss

Genitourinary: Abnormal withdrawal bleeding/flow, breakthrough bleeding, cervical secretion changes, cystitis syndrome, uterine leiomyomata size increased, vaginal candidiasis, vaginal bleeding/spotting

Hematologic: Anemia, porphyria

Hepatic: Cholestatic jaundice

Local: Thrombophlebitis

Neuromuscular & skeletal: Chorea

Ocular: Contact lens intolerance, corneal curvature steepening, neuro-ocular lesions

Respiratory: Asthma exacerbation, pulmonary embolism

Miscellaneous: Anaphylaxis

Metabolism/Transport Effects

Estradiol: **Substrate** of CYP1A2 (major), 2A6 (minor), 2B6 (minor), 2C9 (minor), 2C19 (minor), 2D6 (minor), 2E1 (minor), 3A4 (major); **Inhibits** CYP1A2 (weak), 2C8 (weak); **Induces** CYP3A4 (weak)

Drug Interactions

Acitretin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk X: Avoid combination*

Aminoglutethimide: May increase the metabolism of Progestins. *Risk D: Consider therapy modification*

Aprepitant: May decrease the serum concentration of Contraceptive (Progestins). *Risk D: Consider therapy modification*

Barbiturates: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Benzodiazepines (metabolized by oxidation): Oral Contraceptive (Progestins) may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

CarBAMazepine: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Estrogen Derivatives may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CYP1A2 Inducers (Strong): May increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Felbamate: May decrease the serum concentration of Oral Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Fosaprepitant: May decrease the serum concentration of Contraceptive (Progestins). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Griseofulvin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk X: Avoid combination*

Herbs (Estrogenic Properties): May enhance the adverse/toxic effect of Estrogen Derivatives. *Risk C: Monitor therapy*

Herbs (Progestogenic Properties) (eg, Bloodroot, Yucca): May enhance the adverse/toxic effect of Progestins. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Mycophenolate: May decrease the serum concentration of Oral Contraceptive (Progestins). *Risk D: Consider therapy modification*

OXcarbazepine: May decrease the serum concentration of Oral Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phenytoin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Retinoic Acid Derivatives: May diminish the therapeutic effect of Oral Contraceptive (Progestins). Two forms of contraception are recommended in females of child-bearing potential during retinoic acid derivative therapy. **Exceptions:** Adapalene; Alitretinoin; Tretinoin (Topical). *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Ropinirole: Estrogen Derivatives may increase the serum concentration of Ropinirole. *Risk C: Monitor therapy*

Selegiline: Oral Contraceptive (Progestins) may increase the serum concentration of Selegiline. *Risk D: Consider therapy modification*

Somatropin: Estrogen Derivatives may diminish the therapeutic effect of Somatropin. Shown to be a concern with oral hormone replacement therapy in postmenopausal women. *Risk D: Consider therapy modification*

St Johns Wort: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Thyroid Products: Estrogen Derivatives may diminish the therapeutic effect of Thyroid Products. *Risk C: Monitor therapy*

Tipranavir: Estrogen Derivatives may enhance the dermatologic adverse effect of Tipranavir. The combination of tipranavir/ritonavir and ethinyl estradiol/norethindrone was associated with a high incidence of skin rash. Tipranavir may decrease the serum concentration of Estrogen Derivatives. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Contraceptive (Progestins) may diminish the anticoagulant effect of Vitamin K Antagonists. In contrast, enhanced anticoagulant effects have also been noted with some products. *Risk D: Consider therapy modification*

Voriconazole: May decrease the metabolism of Oral Contraceptive (Progestins). Oral Contraceptive (Progestins) may increase the serum concentration of Voriconazole. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (routine use increases estrogen level and risk of breast cancer). Ethanol may also increase the risk of osteoporosis.

Food: CNS effects of caffeine may be enhanced if combination estrogen/progestins are used concurrently with caffeine. Grapefruit juice increases ethinyl estradiol concentrations and would be expected to increase progesterone serum levels as well; clinical implications are unclear.

Herb/Nutraceutical: St John's wort may decrease the plasma levels of combination estrogen/progestin combinations by inducing hepatic enzymes. Avoid dong quai and black cohosh (have estrogen activity). Avoid saw palmetto, red clover, ginseng.

Test InteractionsPathologist should be advised of estrogen/progesterone therapy when specimens are submitted. Reduced response to metyrapone test.

Monitoring ParametersYearly physical examination that includes blood pressure and Papanicolaou smear, breast exam, mammogram. Monitor for signs of endometrial cancer. Adequate diagnostic measures, including endometrial sampling, if indicated, should be performed to rule out malignancy in all cases of undiagnosed abnormal vaginal bleeding. Monitor for loss of vision, sudden onset of proptosis, diplopia, migraine; signs and symptoms of thromboembolic disorders; glycemic control in patients with diabetes; lipid profiles in patients being treated for hyperlipidemias; thyroid function in patients on thyroid hormone replacement therapy.

Menopausal symptoms: Assess need for therapy at 3- to 6-month intervals

Prevention of osteoporosis: Bone density measurement

Monitoring: Lab TestsYearly Papanicolaou smear, mammogram. Monitor for signs of endometrial cancer. Adequate diagnostic measures, including endometrial sampling, if indicated, should be performed to rule out malignancy in all cases of undiagnosed abnormal vaginal bleeding.

Menopausal symptoms: Assess need for therapy at 3- to 6-month intervals

Prevention of osteoporosis: Bone density measurement

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: Estradiol 1 mg [15 pink tablets] and estradiol 1 mg and norgestimate 0.09 mg [15 white tablets] (supplied in blister card of 30)

Generic AvailableNo

ManufacturerOrtho-McNeil Pharmaceutical, Inc

Pricing: U.S. (www.drugstore.com)

Tablets (Prefest)

1/1-0.09 mg (30): $44.90

Mechanism of ActionEstrogens are responsible for the development and maintenance of the female reproductive system and secondary sexual characteristics. Estradiol is the principle intracellular human estrogen and is more potent than estrone and estriol at the receptor level; it is the primary estrogen secreted prior to menopause. Following menopause, estrone and estrone sulfate are more highly produced. Estrogens modulate the pituitary secretion of gonadotropins, luteinizing hormone, and follicle-stimulating hormone through a negative feedback system; estrogen replacement reduces elevated levels of these hormones in postmenopausal women.

Progestins inhibit gonadotropin production which then prevents follicular maturation and ovulation. In women with adequate estrogen, progestins transform a proliferative endometrium into a secretory endometrium; when administered with estradiol, reduces the incidence of endometrial hyperplasia and risk of adenocarcinoma.

Pharmacodynamics/Kinetics

Estradiol: See Estradiol monograph.

Norgestimate:

Protein binding: 17-deacetylnorgestimate: 99%

Metabolism: Forms 17-deacetylnorgestimate (major active metabolite) and other metabolites; first-pass effect

Half-life elimination: 17-deacetylnorgestimate: 37 hours

Excretion: Norgestimate metabolites: Urine and feces

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, headache, depression, insomnia, nervousness, irritability, and mood disturbances

Mental Health: Effects on Psychiatric TreatmentMay cause flu-like symptoms, take this into consideration if also concerned about SSRI discontinuation syndrome. Carbamazepine and topiramate may increase the metabolism of estradiol, leading to a decrease in serum concentrations. Estrogens may inhibit the metabolism of some benzodiazepines (alprazolam, chlordiazepoxide, diazepam), TCAs, and selegiline. Estrogens may increase the clearance of lorazepam, oxazepam, and temazepam.

The Women's Health Initiative (WHI) Memory Study reported an increased risk of developing dementia in postmenopausal women ≥65 years of age during 4 years of treatment with oral conjugated equine estrogens and medroxyprogesterone acetate relative to placebo (1.8% vs 0.9%). Relative risk was 2.05 (95% CI 1.21-3.48). Therefore, estrogens and progestins should not be used for the prevention of dementia. The WHI also reported an increased risk of stroke (29 vs 21 per 10,000 women-years) compared to women receiving placebo. The increase in risk was observed after the first year and persisted. May cause hypertriglyceridemia; monitor in patients receiving antipsychotics especially clozapine, olanzapine, and quetiapine.

Index TermsEstradiol and NGM; Norgestimate and Estradiol; Ortho Prefest

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Alora® may be confused with Aldara®

Elestrin™ may be confused with alosetron

Estraderm® may be confused with Testoderm®

International issues:

Vivelle®: Brand name for ethinyl estradiol and norgestimate in Austria

Estring® may be confused with Estrena® [Finland]

Estrena® [Finland] may be confused with estrone in the U.S.

Transdermal patch may contain conducting metal (eg, aluminum); remove patch prior to MRI.

Pronunciation(es tra DYE ole)

U.S. Brand NamesAlora®; Climara®; Delestrogen®; Depo®-Estradiol; Divigel®; Elestrin™; Estrace®; Estraderm®; Estrasorb™; Estring®; EstroGel®; Evamist™; Femring®; Femtrace®; Gynodiol® [DSC]; Menostar®; Vagifem®; Vivelle-Dot®; Vivelle® [DSC]

Canadian Brand NamesClimara®; Depo®-Estradiol; Estrace®; Estraderm®; Estradot®; Estring®; EstroGel®; Menostar®; Oesclim®; Sandoz-Estradiol Derm 100; Sandoz-Estradiol Derm 50; Sandoz-Estradiol Derm 75; Vagifem®

Pharmacologic CategoryEstrogen Derivative

Use: Labeled IndicationsTreatment of moderate-to-severe vasomotor symptoms associated with menopause; treatment of vulvar and vaginal atrophy; hypoestrogenism (due to hypogonadism, castration, or primary ovarian failure); prostatic cancer (palliation), breast cancer (palliation), osteoporosis (prophylaxis); abnormal uterine bleeding due to hormonal imbalance; postmenopausal urogenital symptoms of the lower urinary tract (urinary urgency, dysuria)

Dosing: AdultsAll dosage needs to be adjusted based upon the patient's response:

Atrophic vaginitis, vulvar/vaginal atrophy:

Intravaginal:

Vaginal cream: Atrophic vaginitis, kraurosis vulvae: Insert 2-4 g/day for 2 weeks then gradually reduce to $^1/_2$ the initial dose for 2 weeks followed by a maintenance dose of 1 g 1-3 times/week

Vaginal ring:

Postmenopausal vaginal atrophy, urogenital symptoms (Estring®): 2 mg intravaginally; following insertion, ring should remain in place for 90 days

Vulvar/vaginal atrophy (Femring®): 0.05 mg intravaginally; following insertion, ring should remain in place for 3 months; dose may be increased to 0.1 mg if needed

Vaginal tablets (Vagifem®); Atrophic vaginitis: Initial: Insert 1 tablet once daily for 2 weeks; maintenance: Insert 1 tablet twice weekly. Attempts to discontinue or taper medication should be made at 3- to 6-month intervals

Topical gel: Vulvar/vaginal atrophy:

Elestrin™: 0.87 g/day applied at the same time each day

EstroGel®: 1.25 g/day applied at the same time each day

Transdermal: Refer to product-specific dosing (below)

Breast cancer (females; inoperable, progressing): Oral: 10 mg 3 times/day for at least 3 months

Hypogonadism:

Oral: 1-2 mg/day in a cyclic regimen for 3 weeks on drug, then 1 week off drug

I.M.: Cypionate: 1.5-2 mg monthly; Valerate: 10-20 mg every 4 weeks

Transdermal: Refer to product-specific dosing (below)

Osteoporosis prevention (females):

Oral: 0.5 mg/day in a cyclic regimen (3 weeks on and 1 week off of drug)

Transdermal: Refer to product-specific dosing (below)

Prostate cancer:

I.M. (valerate): ≥30 mg or more every 1-2 weeks

Oral (androgen-dependent, inoperable, progressing): 10 mg 3 times/day for at least 3 months

Vasomotor symptoms (moderate to severe) associated with menopause:

Oral (in addition to I.M. dosing): 1-2 mg daily, adjusted as necessary to limit symptoms. Administrations should be cyclic (3 weeks on, 1 week off). Patients should be re-evaluated at 3-6 month intervals to determine if treatment is still necessary

I.M.: Cypionate: 1-5 mg every 3-4 weeks; Valerate: 10-20 mg every 4 weeks

Topical emulsion: 3.84 g applied once daily in the morning

Topical gel:

Divigel®: 0.25 g/day; adjust dose based on patient response. Dosing range: 0.25-1 g/day

Elestrin™: 0.87 g/day applied at the same time each day

EstroGel®: 1.25 g/day applied at the same time each day

Topical spray: (Evamist™): Initial: One spray (1.53 mg) per day. Adjust dose based on patient response. Dosing range: 1-3 sprays per day.

Vaginal ring (Femring®): 0.05 mg intravaginally; following insertion, ring should remain in place for 3 months; dose may be increased to 0.1 mg if needed

Transdermal: See product-specific dosing (below)

Transdermal product-specific dosing:

Note: Indicated dose may be used continuously in patients without an intact uterus. May be given continuously or cyclically (3 weeks on, 1 week off) in patients with an intact uterus **(exception - Menostar®, see specific dosing instructions).** When changing patients from oral to transdermal therapy, start transdermal patch 1 week after discontinuing oral hormone (may begin sooner if symptoms reappear within 1 week):

Transdermal once-weekly patch:

Moderate-to-severe vasomotor symptoms associated with menopause, vulvar and vaginal atrophy associated with menopause, female hypoestrogenism (Climara®): Apply 0.025 mg/day patch once weekly. Adjust dose as necessary to control symptoms. Patients should be re-evaluated at 3- to 6-month intervals to determine if treatment is still necessary.

Prevention of osteoporosis in postmenopausal women:

Climara®: Apply patch once weekly; minimum effective dose 0.025 mg/day; adjust dosage based on response to therapy as indicated by biological markers and bone mineral density.

Menostar®: Apply patch once weekly. In women with a uterus, also administer a progestin for 14 days every 6-12 months.

Transdermal twice-weekly patch (Alora®, Estraderm®, Vivelle®):

Moderate to severe vasomotor symptoms associated with menopause, vulvar/vaginal atrophy, female hypogonadism: Titrate to lowest dose possible to control symptoms, adjusting initial dose after the first month of therapy; re-evaluate therapy at 3- to 6-month intervals to taper or discontinue medication:

Alora®, Esclim®, Estraderm®, Vivelle-Dot®: Apply 0.05 mg patch twice weekly

Vivelle®: Apply 0.0375 mg patch twice weekly

Prevention of osteoporosis in postmenopausal women:

Alora®, Vivelle®, Vivelle-Dot®: Apply 0.025 mg patch twice weekly, increase dose as necessary

Estraderm®: Apply 0.05 mg patch twice weekly

Dosing: ElderlyRefer to adult dosing.

Administration: I.M.Injection for intramuscular administration only.

Administration: Topical

Emulsion: Apply to clean dry skin while in a sitting position. Contents of two pouches (total 3.48 g) are to be applied individually, once daily in the morning. Apply contents of first pouch to left thigh, massage into skin of left thigh and calf until thoroughly absorbed (~3 minutes). Apply excess from both hands to the buttocks. Apply contents of second pouch to the right thigh, massage into skin of right thigh and calf until thoroughly absorbed (~3 minutes). Apply excess from both hands to buttocks. Wash hands with soap and water. Allow skin to dry before covering legs with clothing. Do not apply to other areas of body. Do not apply to red or irritated skin.

Gel: Apply to clean, dry, unbroken skin at the same time each day. Allow to dry for 5 minutes prior to dressing. Gel is flammable; avoid fire or flame until dry. After application, wash hands with soap and water. Prior to the first use, pump must be primed. Do not apply gel to breast.

Divigel®: Apply entire contents of packet to right or left upper thigh each day (alternate sites). Do not apply to face, breasts, vaginal area or irritated skin. Apply over an area ~5x7 inches. Do not wash application site for 1 hour. Allow gel to dry before dressing

Elestrin™: Apply to upper arm and shoulder area using two fingers to spread gel. Apply after bath or shower; allow at least 2 hours between applying gel and going swimming. Wait at least 25 minutes before applying sunscreen to application area. Do not apply sunscreen to application area for ≥7 days (may increase absorption of gel).

EstroGel®: Apply gel to the arm, from the wrist to the shoulder. Spread gel as thinly as possible over one arm.

Spray: Evamist™: Prior to first use, prime pump by spraying 3 sprays with the cover on. To administer dose, hold container upright and vertical and rest the plastic cone flat against the skin while spraying. Spray to the inner surface of the forearm, starting near the elbow. If more than one spray is needed, apply to adjacent but not overlapping areas. Apply at the same time each day. Allow spray to dry for ~2 minutes. Do not wash application site for 30 minutes. Apply to clean, dry, unbroken skin. Do not apply to skin other than that of the forearm. Solution contained in the spray is flammable; avoid fire, flame, or smoking until spray has dried. If needed, sunscreen should be applied ~1 hour prior to application of Evamist™.

Transdermal patch: Aerosol topical corticosteroids applied under the patch may reduce allergic reactions. Do not apply transdermal system to breasts, but place on trunk of body (preferably abdomen). Rotate application sites allowing a 1-week interval between applications at a particular site. Do not apply to oily, damaged or irritated skin; avoid waistline or other areas where tight clothing may rub the patch off. Apply patch immediately after removing from protective pouch. In general, if patch falls off, the same patch may be reapplied or a new system may be used for the remainder of the dosing interval. Swimming, bathing, or showering are not expected to affect use of the patch. Note the following exceptions:

Estraderm®: Do not apply to an area exposed to direct sunlight.

Menostar®: Swimming, bathing, or wearing patch while in a sauna have not been studied; adhesion of patch may be decreased or delivery of estradiol may be affected. Remove patch slowly after use to avoid skin irritation. If any adhesive remains on the skin after removal, first allow skin to dry for 15 minutes, then gently rub area with an oil-based cream or lotion. If patch falls off, a new patch should be applied for the remainder of the dosing interval.

Administration: Other

Vaginal ring: Exact positioning is not critical for efficacy, however, patient should not feel anything once inserted. In case of discomfort, ring should be pushed further into vagina. If ring is expelled prior to 90 days, it may be rinsed off and reinserted.

Vaginal tablet: Insert tablet with supplied applicator at the same time each day. Once inserted, depress plunger until a click is heard, then remove applicator and discard. If tablet comes out of applicator prior to insertion, do not replace; use a new tablet filled applicator instead.

Dietary ConsiderationsEnsure adequate calcium and vitamin D intake when used for the prevention of osteoporosis.

ContraindicationsHypersensitivity to estradiol or any component of the formulation; undiagnosed abnormal vaginal bleeding; history of or current thrombophlebitis or venous thromboembolic disorders (including DVT, PE); active or recent (within 1 year) arterial thromboembolic disease (eg, stroke, MI); carcinoma of the breast, except in appropriately selected patients being treated for metastatic disease; estrogen-dependent tumor; hepatic dysfunction or disease; porphyria; pregnancy

Allergy Considerations

- Estrogen Allergy

Warnings/Precautions

Boxed warnings:

- Cardiovascular disease: See “Disease-related concerns” below.
- Dementia: See “Concerns related to adverse effects” below.
- Endometrial carcinoma: See “Concerns related to adverse effects” below.
- Risks vs benefits: See “Other warnings/precautions” below.

Concerns related to adverse effects:

- Breast cancer: Estrogens may increase the risk of breast cancer. An increased risk of invasive breast cancer was observed in postmenopausal women using conjugated equine estrogens (CEE) in combination with medroxyprogesterone acetate (MPA); a smaller increase in risk was seen with estrogen therapy alone in observational studies. An increase in abnormal mammograms has also been reported with estrogen and progestin therapy. Estrogen use may lead to severe hypercalcemia in patients with breast cancer and bone metastases; discontinue estrogen if hypercalcemia occurs.

- Dementia: **[U.S. Boxed Warning]: The risk of dementia may be increased in postmenopausal women;** increased incidence was observed in women ≥65 years of age taking CEE alone or in combination with MPA.

- Endometrial carcinoma: **[U.S. Boxed Warning]: Adequate diagnostic measures, including endometrial sampling, if indicated, should be performed to rule out malignancy in all cases of undiagnosed abnormal vaginal bleeding. Unopposed estrogens may increase the risk of endometrial carcinoma in postmenopausal women with an intact uterus.** The use of a progestin should be considered when administering estrogens to postmenopausal women with an intact uterus. Estrogens may exacerbate endometriosis. Malignant transformation of residual endometrial implants has been reported posthysterectomy with estrogen only therapy. Consider adding a progestin in women with residual endometriosis posthysterectomy.

- Lipid effects: Estrogen compounds are generally associated with lipid effects such as increased HDL-cholesterol and decreased LDL-cholesterol. Triglycerides may also be increased; use with caution in patients with familial defects of lipoprotein metabolism.

- Retinal vascular thrombosis: Estrogens may cause retinal vascular thrombosis; discontinue permanently if papilledema or retinal vascular lesions are observed on examination.

Disease-related concerns:

- Cardiovascular disease: **[U.S. Boxed Warning]: Estrogens with or without progestin should not be used to prevent coronary heart disease.** Use caution with cardiovascular disease or dysfunction. May increase the risks of hypertension, myocardial infarction (MI), stroke, pulmonary emboli (PE), and deep vein thrombosis; incidence of these effects was shown to be significantly increased in postmenopausal women using CEE in combination with MPA. Nonfatal MI, PE, and thrombophlebitis have also been reported in males taking high doses of CEE (eg, for prostate cancer).

- Cholestatic jaundice: Use caution with history of cholestatic jaundice associated with past estrogen use or pregnancy.

- Diseases exacerbated by fluid retention: Use with caution in patients with diseases which may be exacerbated by fluid retention, including asthma, epilepsy, migraine, diabetes or renal dysfunction.

- Gallbladder disease: Use with caution in patients with gallbladder disease.

- Hepatic hemangiomas: Use with caution in patients with hepatic hemangiomas.

- Hypocalcemia: Use with caution in patients with severe hypocalcemia.

- Porphyria: Use with caution in patients with porphyria; use is contraindicated with certain products.

- SLE: Use with caution in patients with SLE.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children. Prior to puberty, estrogens may cause premature closure of the epiphyses, premature breast development in girls or gynecomastia in boys. Vaginal bleeding and vaginal cornification may also be induced in girls.

- Surgical patients: Whenever possible, estrogens should be discontinued at least 4 weeks prior to and for 2 weeks following elective surgery associated with an increased risk of thromboembolism or during periods of prolonged immobilization.

Dosage form specific issues:

- Topical emulsion, gel, spray: Absorption of the topical emulsion (Estrasorb™) and topical gel (Elestrin™) is increased by application of sunscreen; do not apply sunscreen within close proximity of estradiol. When sunscreen is applied ~1 hour prior to the topical spray (Evamist™), no change in absorption was observed (estradiol absorption was decreased when sunscreen is applied 1 hour after Evamist™). Application of Divigel® or EstroGel® with sunscreen has not been evaluated.

- Transdermal patch: May contain conducting metal (eg, aluminum); remove patch prior to MRI.

- Vaginal ring: Use may not be appropriate in women with narrow vagina, vaginal stenosis, vaginal infections, cervical prolapse, rectoceles, cystoceles, or other conditions which may increase the risk of vaginal irritation, ulceration, or increase the risk of expulsion. Remove ring if vaginal infection develops; reinsert only after infection has been appropriately treated. Ring should also be removed in case of ulceration, erosion, or adherence to vaginal wall; do not reinsert until healing is complete.

Other warnings/precautions:

- Osteoporosis use: When used solely for prevention of osteoporosis in women at significant risk, nonestrogen treatment options should be considered.

- Risks vs. benefits: **[U.S. Boxed Warning]: Estrogens with or without progestin should be used for shortest duration possible at the lowest effective dose consistent with treatment goals.** Before prescribing estrogen therapy to postmenopausal women, the risks and benefits must be weighed for each patient. Women should be informed of these risks and benefits, as well as possible effects of progestin when added to estrogen therapy. Conduct periodic risk:benefit assessments.

- Vulvar and vaginal atrophy use: When used solely for the treatment of vulvar and vaginal atrophy, topical vaginal products should be considered. Use caution applying topical products to severely atrophic vaginal mucosa.

Geriatric ConsiderationsBefore prescribing estrogen therapy to postmenopausal women, the risks and benefits must be weighed for each patient. Data in women ≥80 years are minimal and it is unclear if the reduced risk is applicable to women in this age group. Women should be informed of these risks and benefits, as well as possible side effects and the return of menstrual bleeding (when cycled with a progestin), and be involved in the decision to prescribe. Oral therapy may be more convenient for vaginal atrophy and urinary incontinence.

Pregnancy Risk FactorX

Pregnancy ConsiderationsEstrogens are not indicated for use during pregnancy or immediately postpartum. Increased risk of fetal reproductive tract disorders and other birth defects have been observed with diethylstilbestrol (DES). In general, the use of estrogen and progestin as in combination hormonal contraceptives have not been associated with teratogenic effects when inadvertently taken early in pregnancy. These products are not intended to be used during pregnancy.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsThe AAP considers ethinyl estradiol, an estrogen derivative, to be “usually compatible” with breast-feeding. Estrogen has been shown to decrease the quantity and quality of human milk; use only if clearly needed; monitor the growth of the infant closely.

Adverse ReactionsFrequency not defined. Some adverse reactions observed with estrogen and/or progestin combination therapy.

Cardiovascular: Chest pain, DVT, edema, hypertension, MI, stroke, syncope, venous thromboembolism

Central nervous system: Anxiety, dementia, dizziness, epilepsy exacerbation, headache, insomnia, irritability, mental depression, migraine, mood disturbances, nervousness

Dermatologic: Angioedema, chloasma, dermatitis, erythema multiforme, erythema nodosum, hemorrhagic eruption, hirsutism, loss of scalp hair, melasma, rash, pruritus, urticaria

Endocrine & metabolic: Breast cancer, breast enlargement, breast pain, breast tenderness, fibrocystic breast changes, HDL-cholesterol increased, galactorrhea, glucose intolerance, hot flashes, hypocalcemia, LDL-cholesterol decreased, libido changes, nipple pain, serum triglycerides/phospholipids increased, thyroid-binding globulin increased, total thyroid hormone (T_4) increased

Gastrointestinal: Abdominal cramps, abdominal distension, abdominal pain, bloating, cholecystitis, cholelithiasis, diarrhea, dyspepsia, flatulence, gallbladder disease, gastritis, nausea, pancreatitis, vomiting, weight gain/loss

Genitourinary: Alterations in frequency and flow of menses, cervical secretion changes, cystitis, dysmenorrhea, dysuria, endometrial cancer, endometrial hyperplasia, genital eruption, metrorrhagia, ovarian cancer, Pap smear suspicious, urinary tract infection, uterine leiomyomata size increased, leukorrhea, uterine pain, urinary incontinence, urogenital eruption/pruritus, vaginal candidiasis, vaginal discharge, vaginal moniliasis, vaginitis

Vaginal: Trauma from applicator insertion may occur in women with severely atrophic vaginal mucosa; skin hypertrophy, vaginal discomfort, vaginal hemorrhage, vaginal pain

Hematologic: Aggravation of porphyria, antithrombin III and antifactor Xa decreased, fibrinogen levels increased, platelet aggregability increased, platelet count increased, prothrombin increased; factors VII, VIII, IX, X increased

Hepatic: Cholestatic jaundice, hepatic hemangioma enlargement

Local: Thrombophlebitis

Gel, spray: Application site reaction

Transdermal patches: Burning, erythema, irritation

Neuromuscular & skeletal: Arthralgia, arthritis, back pain, chorea, leg cramps, muscle cramps, skeletal pain

Ocular: Contact lens intolerance, corneal curvature steepening, retinal vascular thrombosis, vision abnormal

Respiratory: Asthma exacerbation, pulmonary thromboembolism

Miscellaneous: Anaphylactoid/anaphylactic reactions

Postmarketing and/or case reports: Liver function tests increased (rare), leg pain

Vaginal ring: Bowel obstruction, ring adherence to vaginal wall, toxic shock syndrome

Metabolism/Transport Effects **Substrate** of CYP1A2 (major), 2A6 (minor), 2B6 (minor), 2C9 (minor), 2C19 (minor), 2D6 (minor), 2E1 (minor), 3A4 (major); **Inhibits** CYP1A2 (weak), 2C8 (weak); **Induces** CYP3A4 (weak)

Drug Interactions

Corticosteroids (Systemic): Estrogen Derivatives may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CYP1A2 Inducers (Strong): May increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (Estrogenic Properties): May enhance the adverse/toxic effect of Estrogen Derivatives. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Ropinirole: Estrogen Derivatives may increase the serum concentration of Ropinirole. *Risk C: Monitor therapy*

Somatropin: Estrogen Derivatives may diminish the therapeutic effect of Somatropin. Shown to be a concern with oral hormone replacement therapy in postmenopausal women. *Risk D: Consider therapy modification*

Thyroid Products: Estrogen Derivatives may diminish the therapeutic effect of Thyroid Products. *Risk C: Monitor therapy*

Tipranavir: Estrogen Derivatives may enhance the dermatologic adverse effect of Tipranavir. The combination of tipranavir/ritonavir and ethinyl estradiol/norethindrone was associated with a high incidence of skin rash. Tipranavir may decrease the serum concentration of Estrogen Derivatives. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (routine use increases estrogen level and risk of breast cancer). Ethanol may also increase the risk of osteoporosis.

Food: Folic acid absorption may be decreased

Herb/Nutraceutical: St John's wort may decrease levels. Herbs with estrogenic properties may enhance the adverse/toxic effect of estrogen derivatives; examples include alfalfa, black cohosh, bloodroot, hops, kudzu, licorice, red clover, saw palmetto, soybean, thyme, wild yam, yucca.

Test InteractionsPathologist should be advised of estrogen/progesterone therapy when specimens are submitted. Reduced response to metyrapone test.

Monitoring ParametersRoutine physical examination that includes blood pressure and Papanicolaou smear, breast exam, mammogram. Monitor for signs of endometrial cancer in female patients with uterus. Adequate diagnostic measures, including endometrial sampling, if indicated, should be performed to rule out malignancy in all cases of undiagnosed abnormal vaginal bleeding. Monitor for loss of vision, sudden onset of proptosis, diplopia, migraine; signs and symptoms of thromboembolic disorders; glycemic control in patients with diabetes; lipid profiles in patients being treated for hyperlipidemias; thyroid function in patients on thyroid hormone replacement therapy.

When using Menostar® in a woman with a uterus, endometrial sampling is recommended at yearly intervals or when clinically indicated.

Menopausal symptoms: Assess need for therapy at 3- to 6-month intervals

Prevention of osteoporosis: Bone density measurement

Reference Range

Children: <10 pg/mL (SI: <37 pmol/L)

Male: 10-50 pg/mL (SI: 37-184 pmol/L)

Female:

Premenopausal: 30-400 pg/mL (SI: 110-1468 pmol/L)

Postmenopausal: 0-30 pg/mL (SI: 0-110 pmol/L)

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents or herbal products patient may be taking (eg, increased or decreased levels/effects of estradiol or increased potential for toxicity or thrombolic events). Assess results of annual gynecological exam, therapeutic effectiveness (dependent on rationale for use), need for continued therapy, and adverse effects (eg, thromboembolism, hypertension, edema, CNS changes) on a regular basis during therapy. **Note:** Before prescribing estrogen therapy to postmenopausal women, the risks and benefits must be weighed for each patient. Women should be informed of these risks and benefits, as well as possible effects of progestin when added to estrogen therapy. Estrogens with or without progestin should be used for shortest duration possible consistent with treatment goals and periodic assessment of risk:benefit should be made. Caution patients with diabetes to monitor glucose levels closely (may impair glucose tolerance). Teach patient proper use and application (according to formulation), possible side effects/appropriate interventions, and adverse symptoms to report. Remind patient about the importance of frequent self-breast exams and the need for annual gynecological exam. **Pregnancy risk factor X:** Determine that patient is not pregnant before starting therapy. Do not give to females of childbearing age unless patient is capable of complying with contraceptive use. Advise patient about contraceptive measures as appropriate.

Monitoring: Lab TestsRoutine Papanicolaou smear, mammogram. Adequate diagnostic measures, including endometrial sampling, if indicated, should be performed to rule out malignancy in all cases of undiagnosed abnormal vaginal bleeding.

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy without consulting prescriber. Follow directions for timing and application of your prescription (see product insert or consult prescriber). Wash hands thoroughly prior to and following application; do not apply topical agent to damaged, reddened, or irritated skin; do not allow agent to come in contact with face or eyes. Routine use of alcohol may increase estrogen level and risk of breast cancer. Annual gynecologic and regular self-breast exams are important. If you have diabetes, monitor glucose levels closely (may impair glucose tolerance). You may experience nausea, vomiting, or abdominal pain (small, frequent meals may help); dizziness or mental depression (use caution when driving); rash; hair loss; headache; or breast pain, increased/decreased libido, enlargement/tenderness of breasts, or difficult/painful menstrual cycles. Report unusual swelling of extremities; sudden acute pain in legs or calves, chest, or abdomen; shortness of breath; severe headache or vomiting; sudden blindness or change in visual acuity; weakness or numbness of arm or leg; unusual vaginal bleeding; yellowing of skin or eyes; unusual bruising or bleeding; skin rash; or other persistent adverse reactions. You may become intolerant to wearing contact lenses; notify prescriber if this occurs. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant while taking this medication. Consult prescriber for appropriate contraceptive measures. This medication may cause fetal defects and should not be used during pregnancy. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Cream, vaginal:

Estrace®: 0.1 mg/g (42.5 g)

Emulsion, topical, as hemihydrate:

Estrasorb™: 2.5 mg/g (56s) [each pouch contains 4.35 mg estradiol hemihydrate; contents of two pouches delivers estradiol 0.05 mg/day]

Gel, topical:

Divigel®: 0.1% (0.25 g) [delivers estradiol 0.25 mg/packet]; (0.5 g) [delivers 0.5 mg estradiol/packet]; (1 g) [delivers estradiol 1 mg/packet]

Elestrin™: 0.06% (144 g) [delivers estradiol 0.52 mg/0.87 g; 100 actuations]

EstroGel®: 0.06% (50 g) [delivers estradiol 0.75 mg/1.25 g; 32 actuations; contains ethanol]

Injection, oil, as cypionate:

Depo®-Estradiol: 5 mg/mL (5 mL) [contains chlorobutanol, cottonseed oil]

Injection, oil, as valerate: 10 mg/mL (5 mL); 20 mg/mL (5 mL); 40 mg/mL (5 mL)

Delestrogen®:

10 mg/mL (5 mL) [contains chlorobutanol, sesame oil]

20 mg/mL (5 mL) [contains benzyl alcohol, castor oil]

40 mg/mL (5 mL) [contains benzyl alcohol, castor oil]

Ring, vaginal, as base:

Estring®: 2 mg (1s) [total estradiol 2 mg; releases 7.5 mcg/day over 90 days]

Ring, vaginal, as acetate:

Femring®: 0.05 mg/day (1s) [total estradiol 12.4 mg; releases 0.05 mg/day over 3 months]; 0.1 mg/day (1s) [total estradiol 24.8 mg; releases 0.1 mg/day over 3 months]

Solution, topical [spray]:

Evamist™: 1.53 mg/spray (8.1 mL) [contains 56 sprays after priming; contains ethanol]

Tablet, oral, as acetate:

Femtrace®: 0.45 mg, 0.9 mg, 1.8 mg

Tablet, oral, micronized: 0.5 mg, 1 mg, 2 mg

Estrace®: 0.5 mg, 1 mg, 2 mg [2 mg tablets contain tartrazine]

Gynodiol®: 0.5 mg [DSC], 1 mg [DSC], 1.5 mg [DSC], 2 mg [DSC]

Tablet, vaginal, as base:

Vagifem®: 25 mcg

Transdermal system: 0.025 mg/24 hours (4s) [once-weekly patch]; 0.0375 mg/24 hours (4s) [once-weekly patch]; 0.05 mg/24 hours (4s) [once-weekly patch]; 0.06 mg/24 hours (4s) [once-weekly patch]; 0.075 mg/24 hours [once-weekly patch]; 0.1 mg/24 hours (4s) [once-weekly patch]

Alora® [twice-weekly patch]:

0.025 mg/24 hours (8s) [9 cm^2, total estradiol 0.77 mg]

0.05 mg/24 hours (8s, 24s [DSC]) [18 cm^2, total estradiol 1.5 mg]

0.075 mg/24 hours (8s) [27 cm^2, total estradiol 2.3 mg]

0.1 mg/24 hours (8s) [36 cm^2, total estradiol 3.1 mg]

Climara® [once-weekly patch]:

0.025 mg/24 hours (4s) [6.5 cm^2, total estradiol 2.04 mg]

0.0375 mg/24 hours (4s) [9.375 cm^2, total estradiol 2.85 mg]

0.05 mg/24 hours (4s) [12.5 cm^2, total estradiol 3.8 mg]

0.06 mg/24 hours (4s) [15 cm^2, total estradiol 4.55 mg]

0.075 mg/24 hours (4s) [18.75 cm^2, total estradiol 5.7 mg]

0.1 mg/24 hours (4s) [25 cm^2, total estradiol 7.6 mg]

Estraderm® [twice-weekly patch]:

0.05 mg/24 hours (8s) [10 cm^2, total estradiol 4 mg]

0.1 mg/24 hours (8s) [20 cm^2, total estradiol 8 mg]

Menostar® [once-weekly patch]: 0.014 mg/24 hours (4s) [3.25 cm^2, total estradiol 1 mg]

Vivelle® [twice-weekly patch]:

0.05 mg/24 hours (8s) [14.5 cm^2, total estradiol 4.33 mg] [DSC]

0.1 mg/24 hours (8s) [29 cm^2, total estradiol 8.66 mg] [DSC]

Vivelle-Dot® [twice-weekly patch]:

0.025 mg/day (24s) [2.5 cm^2, total estradiol 0.39 mg]

0.0375 mg/day (24s) [3.75 cm^2, total estradiol 0.585 mg]

0.05 mg/day (24s) [5 cm^2, total estradiol 0.78 mg]

0.075 mg/day (24s) [7.5 cm^2, total estradiol 1.17 mg]

0.1 mg/day (24s) [10 cm^2, total estradiol 1.56 mg]

Generic AvailableYes: Oral tablet, patch, valerate oil for injection

Mechanism of ActionEstrogens are responsible for the development and maintenance of the female reproductive system and secondary sexual characteristics. Estradiol is the principle intracellular human estrogen and is more potent than estrone and estriol at the receptor level; it is the primary estrogen secreted prior to menopause. Following menopause, estrone and estrone sulfate are more highly produced. Estrogens modulate the pituitary secretion of gonadotropins, luteinizing hormone, and follicle-stimulating hormone through a negative feedback system; estrogen replacement reduces elevated levels of these hormones in postmenopausal women.

Pharmacodynamics/Kinetics

Absorption: Oral, topical: Well absorbed

Protein binding: 37% to sex hormone-binding globulin; 61% to albumin

Metabolism: Hepatic via oxidation and conjugation in GI tract; hydroxylated via CYP3A4 to metabolites; first-pass effect; enterohepatic recirculation; reversibly converted to estrone and estriol

Excretion: Primarily urine (as metabolites estrone and estriol); feces (small amounts)

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status May cause dizziness, headache, depression, insomnia, nervousness, irritability, and mood disturbances

Mental Health: Effects on Psychiatric Treatment The Women's Health Initiative (WHI) Memory Study reported an increased risk of developing dementia in postmenopausal women ≥65 years of age during 4 years of treatment with oral conjugated equine estrogens and medroxyprogesterone acetate relative to placebo (1.8% vs 0.9%). Relative risk was 2.05 (95% CI 1.21-3.48). Therefore, estrogens and progestins should not be used for the prevention of dementia. The WHI also reported an increased risk of stroke (29 vs 21 per 10,000 women-years) compared to women receiving placebo. The increase in risk was observed after the first year and persisted. May cause hypertriglyceridemia; monitor in patients receiving antipsychotics especially clozapine, olanzapine, and quetiapine.

Cardiovascular Considerations It is important to recognize that estrogens may induce or worsen hypertension. These problems are less severe with lower doses. Furthermore, estrogens may precipitate thromboembolic events, particularly in women who smoke. It is important that patients on long-term estrogens undergo monitoring of blood pressure and avoid cigarette use.

Several observational trials evaluating the use of estrogen in primary prevention of coronary artery disease in women found a decrease in cardiovascular events. However, a recent trial (HERS) found that women with coronary disease derived no cardiovascular protection compared to those treated with placebo. Substantial evidence suggests that estrogen therapy increases bone mineralization and therefore may be of added benefit in patients with osteoporosis. Estrogen also has a favorable effect on lipids (decreases total cholesterol and LDL, increases HDL) but increases triglycerides. Therapy should be initiated after careful evaluation of risk:benefit for therapy.

Index Terms Estradiol Acetate; Estradiol Cypionate; Estradiol Hemihydrate; Estradiol Transdermal; Estradiol Valerate

Estramustine + Docetaxel + Hydrocortisone

Estramustine + Docetaxel + Prednisone

Estramustine + Etoposide

Estramustine-Vinblastine

Estramustine + Vinorelbine

Paclitaxel + Estramustine + Carboplatin

Paclitaxel + Estramustine + Etoposide

Estramustine-Paclitaxel

Administration: OralAdminister on an empty stomach, at least 1 hour before or 2 hours after eating.

Dietary ConsiderationsShould be taken at least 1 hour before or 2 hours after eating. Milk products and calcium-rich foods or supplements may impair the oral absorption of estramustine phosphate sodium.

StorageRefrigerate at 2°C to 8°C (36°F to 46°F).

ContraindicationsHypersensitivity to estramustine, estradiol, nitrogen mustard, or any component of the formulation; active thrombophlebitis or thromboembolic disorders (except where tumor mass is the cause of thromboembolic disorder and the benefit may outweigh the risk)

Canadian labeling: Additional contraindications (not in the U.S. labeling): Severe hepatic or cardiac disease

Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Allergic reaction: Allergic reactions and angioedema, including airway involvement, have been reported.
- Cardiovascular effects: Elevated blood pressure or congestive heart disease may occur. Estrogen treatment for prostate cancer is associated with an increased risk of thrombosis or MI.
- Estrogenic effects: Estrogen use may cause gynecomastia and/or impotence.
- Fluid retention: Peripheral edema (new onset or exacerbation) or congestive heart disease may occur. Use with caution in patients where fluid accumulation may be poorly tolerated, including cardiovascular disease (HF or hypertension), migraine, seizure disorder or renal dysfunction.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with a history of cardiovascular disease (eg, thrombophlebitis, thrombosis, or thromboembolic disease) and cerebrovascular or coronary artery disease.
- Diabetes: Use with caution in patients with diabetes mellitus; may decrease glucose tolerance.
- Hepatic impairment: Use with caution in patients with hepatic impairment (may be metabolized poorly).
- Metabolic bone disease: Use with caution in patients with metabolic bone diseases due to the effects on calcium and phosphorus homeostasis.
- Osteoblastic metastases: Patients with osteoblastic metastases should have their calcium monitored regularly.
- Renal impairment: Use with caution in patients with renal impairment.

Concurrent drug therapy issues:

- Immunization: Avoid vaccination with live vaccines during treatment (risk of infection may be increased due to immunosuppression). Although the response to vaccines may be diminished, inactivated vaccines may be administered during treatment.

Other warnings/precautions:

- Monitoring: Patients with prostate cancer should have their calcium monitored regularly.

Pregnancy ConsiderationsEstramustine is not indicated for use in women. Men who were impotent on estrogen therapy have regained potency while taking estramustine; effective contraception should be used for male patients with partners of childbearing potential.

Breast-Feeding ConsiderationsEstramustine is not indicated for use in women.

Adverse Reactions

>10%:

Cardiovascular: Edema (20%)

Endocrine & metabolic: Gynecomastia (75%), breast tenderness (71%), libido decreased

Gastrointestinal: Nausea (16%), diarrhea (13%), gastrointestinal upset (12%)

Hepatic: LDH increased (2% to 33%), AST increased (2% to 33%)

Respiratory: Dyspnea (12%)

1% to 10%:

Cardiovascular: CHF (3%), MI (3%), cerebrovascular accident (2%), chest pain (1%), flushing (1%)

Central nervous system: Lethargy (4%), insomnia (3%), emotional lability (2%), anxiety (1%), headache (1%)

Dermatologic: Bruising (3%), dry skin (2%), pruritus (2%), hair thinning (1%), rash (1%), skin peeling (1%)

Gastrointestinal: Anorexia (4%), flatulence (2%), burning throat (1%), gastrointestinal bleeding (1%), thirst (1%), vomiting (1%)

Hematologic: Leukopenia (4%), thrombocytopenia (1%)

Hepatic: Bilirubin increased (1% to 2%)

Local: Thrombophlebitis (3%)

Neuromuscular & skeletal: Leg cramps (9%)

Ocular: Tearing (1%)

Respiratory: Pulmonary embolism (2%), upper respiratory discharge (1%), hoarseness (1%)

<1%, postmarketing, and/or case reports: Allergic reactions, anemia, angina, angioedema, cerebrovascular ischemia, confusion, coronary ischemia, depression, glucose tolerance decreased, hyper-/hypocalcemia, hypertension, impotence, muscle weakness, venous thrombosis

Oncology: Emetic PotentialLow (10% to 30%)
Drug Interactions

Calcium Salts: May decrease the absorption of Estramustine. **Exceptions:** Calcium Chloride. *Risk D: Consider therapy modification*

Clodronate: May increase the serum concentration of Estramustine. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsFood: Estramustine serum levels may be decreased if taken with milk and other dairy products, calcium supplements, and vitamins containing calcium.
Monitoring ParametersSerum calcium, liver function tests; blood pressure
Nursing: Physical Assessment/MonitoringUse caution in presence of renal or hepatic impairment, metabolic disease, seizure disorders, or migraine history. Assess results of laboratory tests (serum calcium levels, LFTs), therapeutic effectiveness, and adverse response (eg, hypertension, CNS changes, thromboembolism) on a regular basis during therapy. Caution patients with diabetes to monitor glucose carefully; glucose tolerance may be decreased. Teach patient appropriate use, possible side effects/appropriate interventions, and adverse symptoms to report.
Monitoring: Lab TestsSerum calcium, liver function tests
Patient EducationDo not take any new prescription or over-the-counter medications or herbal products during therapy unless approved by prescriber. It may take several weeks to manifest effects of this medication. Store capsules in refrigerator. Take on empty stomach, 1 hour before or 2 hours after meals or any supplements containing calcium; do not take with milk or milk products. Patients with diabetes should use caution and monitor glucose carefully; glucose tolerance may be decreased. May cause nausea or vomiting (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); flatulence; diarrhea (buttermilk, boiled milk, or yogurt may help); decreased libido (reversible); or breast tenderness or enlargement. Report sudden acute pain or cramping in legs or calves, unusual swelling in legs or feet, chest pain, shortness of breath, weakness or numbness of arms or legs, respiratory difficulty, or other adverse side effects. **Pregnancy precaution:** Not indicated for use in women. Males who were impotent on estrogen therapy have regained potency while taking estramustine. Males with partners of childbearing potential should consult prescriber for instruction on appropriate barrier contraceptive measures. This drug may cause severe fetal defects.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, as phosphate sodium:

Emcyt®: 140 mg

Generic AvailableNo
ManufacturerPfizer
Pricing: U.S. (www.drugstore.com)

Capsules (Emcyt)

140 mg (150): $752.64

Mechanism of ActionCombines the effects of estradiol and nitrogen mustard. It appears to bind to microtubule proteins, preventing normal tubulin function. The antitumor effect may be due solely to an estrogenic effect. Estramustine causes a marked decrease in plasma testosterone and an increase in estrogen levels.
Pharmacodynamics/Kinetics

Absorption: Oral: 75%

Metabolism:

GI tract: Initial dephosphorylation

Hepatic: Oxidation and hydrolysis; metabolites include estramustine, estrone analog, estrone, and estradiol

Half-life elimination: Terminal: 15-24 hours

Time to peak, serum: 2-3 hours

Excretion: Feces (2.9% to 4.8% as unchanged drug)

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause sedation or insomnia; rarely may cause depression
Mental Health: Effects on Psychiatric TreatmentNone reported
Index TermsEstramustine Phosphate; Estramustine Phosphate Sodium; NSC-89199

Medication Safety Issues

Sound-alike/look-alike issues:

Cenestin® may be confused with Senexon®

International issues:

Cenestin® may be confused with Canesten® which is a brand name for clotrimazole in multiple international markets and a brand name for fluconazole in Great Britain

Pronunciation(ES troe jenz, KON joo gate ed, aye, sin THET ik)

U.S. Brand NamesCenestin®

Canadian Brand NamesCenestin

Pharmacologic CategoryEstrogen Derivative

Use: Labeled IndicationsTreatment of moderate-to-severe vasomotor symptoms of menopause; treatment of vulvar and vaginal atrophy

Dosing: AdultsThe lowest dose that will control symptoms should be used. Medication should be discontinued as soon as possible.

Menopause, moderate-to-severe vasomotor symptoms: Oral: 0.45 mg/day; may be titrated up to 1.25 mg/day; attempts to discontinue medication should be made at 3- to 6-month intervals

Vulvar and vaginal atrophy: Oral: 0.3 mg/day

Dosing: ElderlyRefer to adult dosing. A higher incidence of stroke and invasive breast cancer were observed in women >75 years in a WHI substudy using conjugated equine estrogen.

StorageStore at room temperature of 25°C (77°F).

ContraindicationsHypersensitivity to estrogens or any component of the formulation; undiagnosed abnormal vaginal bleeding; history of or current thrombophlebitis or venous thromboembolic disorders (including DVT, PE); active or recent (within 1 year) arterial thromboembolic disease (eg, stroke, MI); carcinoma of the breast; estrogen-dependent tumor; hepatic dysfunction or disease; pregnancy

Allergy Considerations

- Estrogen Allergy

Warnings/Precautions

Boxed warnings:

- Cardiovascular disease: See “Disease-related concerns” below.
- Dementia: See “Concerns related to adverse effects” below.
- Endometrial carcinoma: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Breast cancer: Estrogens may increase the risk of breast cancer. An increased risk of invasive breast cancer was observed in postmenopausal women using CEE in combination with MPA; a smaller increase in risk was seen with estrogen therapy alone in observational studies. An increase in abnormal mammograms has also been reported with estrogen and progestin therapy. Estrogen use may lead to severe hypercalcemia in patients with breast cancer and bone metastases; discontinue estrogen if hypercalcemia occurs.
- Dementia: **[U.S. Boxed Warning]: The risk of dementia may be increased in postmenopausal women;** increased incidence was observed in women ≥65 years of age taking CEE alone or in combination with MPA.
- Endometrial carcinoma: **[U.S. Boxed Warning]: Unopposed estrogens may increase the risk of endometrial carcinoma in postmenopausal women.** Estrogens may exacerbate endometriosis. Malignant transformation of residual endometrial implants has been reported posthysterectomy with estrogen only therapy. Consider adding a progestin in women with residual endometriosis posthysterectomy.
- Lipid effects: Estrogen compounds are generally associated with lipid effects such as increased HDL-cholesterol and decreased LDL-cholesterol. Triglycerides may also be increased; use with caution in patients with familial defects of lipoprotein metabolism.
- Retinal vascular thrombosis: Estrogens may cause retinal vascular thrombosis; discontinue permanently if papilledema or retinal vascular lesions are observed on examination.

Disease-related concerns:

- Cardiovascular disease: **[U.S. Boxed Warning]: Estrogens with or without progestin should not be used to prevent coronary heart disease.** Use caution with cardiovascular disease or dysfunction. May increase the risks of hypertension, myocardial infarction (MI), stroke, pulmonary emboli (PE), and deep vein thrombosis; incidence of these effects was shown to be significantly increased in postmenopausal women using conjugated equine estrogens (CEE) in combination with medroxyprogesterone acetate (MPA). Nonfatal MI, PE, and thrombophlebitis have also been reported in males taking high doses of CEE (eg, for prostate cancer).

- Cholestatic jaundice: Use caution with history of cholestatic jaundice associated with past estrogen use or pregnancy.

- Diseases exacerbated by fluid retention: Use with caution in patients with diseases which may be exacerbated by fluid retention, including asthma, epilepsy, migraine, diabetes or renal dysfunction.

- Gallbladder disease: Use with caution in patients with gallbladder disease.

- Hepatic hemangiomas: Use with caution in patients with hepatic hemangiomas.

- Hypocalcemia: Use with caution in patients with severe hypocalcemia.

- Porphyria: Use with caution in patients with porphyria.

- SLE: Use with caution in patients with SLE.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children. Prior to puberty, estrogens may cause premature closure of the epiphyses, premature breast development in girls or gynecomastia in boys. Vaginal bleeding and vaginal cornification may also be induced in girls.

- Surgical patients: Whenever possible, estrogens should be discontinued at least 4 weeks prior to and for 2 weeks following elective surgery associated with an increased risk of thromboembolism or during periods of prolonged immobilization.

Other warnings/precautions:

- Osteoporosis use: When used solely for prevention of osteoporosis in women at significant risk, nonestrogen treatment options should be considered.

- Risks vs. benefits: Before prescribing estrogen therapy to postmenopausal women, the risks and benefits must be weighed for each patient. Women should be informed of these risks and benefits, as well as possible effects of progestin when added to estrogen therapy. Estrogens with or without progestin should be used for shortest duration possible consistent with treatment goals. Conduct periodic risk:benefit assessments.

- Vulvar and vaginal atrophy use: When used solely for the treatment of vulvar and vaginal atrophy, topical vaginal products should be considered.

Geriatric ConsiderationsBefore prescribing estrogen therapy to postmenopausal women, the risks and benefits must be weighed for each patient. Women should be informed of these risks and benefits, as well as possible side effects and the return of menstrual bleeding (when cycled with a progestin), and be involved in the decision to prescribe. A higher incidence of stroke and invasive breast cancer were observed in women >75 years in a WHI substudy using conjugated equine estrogen. Oral therapy may be more convenient for vaginal atrophy and urinary incontinence.

Pregnancy ConsiderationsUse during pregnancy is contraindicated.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsThe AAP considers ethinyl estradiol, an estrogen derivative, to be “usually compatible” with breast-feeding. Estrogen has been shown to decrease the quantity and quality of human milk. Use only if clearly needed. Monitor the growth of the infant closely.

Adverse Reactions

>10%:

Central nervous system: Headache (11% to 68%), dizziness (11%), pain (11%)

Endocrine & metabolic: Breast pain (29%), endometrial thickening (19%), metrorrhagia (14%)

Gastrointestinal: Abdominal pain (9% to 28%), nausea (9% to 18%)

Neuromuscular & skeletal: Paresthesia (8% to 33%), back pain (14%)

Respiratory: Upper respiratory tract infection (13%)

Miscellaneous: Infection (2% to 14%)

1% to 10%:

Central nervous system: Anxiety (6%), fever (1%)

Gastrointestinal: Dyspepsia (10%), vomiting (7%), constipation (6%), diarrhea (6%), weight gain (6%)

Genitourinary: Vaginitis (8%)

Neuromuscular & skeletal: Leg cramps (10%), hypertonia (6%)

Respiratory: Rhinitis (6% to 8%), cough (6%)

In addition, the following have been reported with estrogen and/or progestin therapy:

Cardiovascular: Edema, hypertension, MI, stroke, venous thromboembolism

Central nervous system: Epilepsy exacerbation, irritability, mental depression, migraine, mood disturbances, nervousness

Dermatologic: Angioedema, chloasma, erythema multiforme, erythema nodosum, hemorrhagic eruption, hirsutism, melasma, pruritus, rash, scalp hair loss, urticaria

Endocrine & metabolic: Breast cancer, breast enlargement, breast tenderness, glucose tolerance impaired, HDL-cholesterol increased, hyper-/hypocalcemia, LDL-cholesterol decreased, libido changes, serum triglycerides/phospholipids increased, thyroid-binding globulin increased, total thyroid hormone (T_4) increased

Gastrointestinal: Abdominal cramps, bloating, cholecystitis, cholelithiasis, gallbladder disease, pancreatitis, weight gain/loss

Genitourinary: Alterations in frequency and flow of menses, cervical secretion changes, endometrial cancer, endometrial hyperplasia, uterine leiomyomata size increased, vaginal candidiasis

Hematologic: Aggravation of porphyria, antithrombin III and antifactor Xa decreased, fibrinogen levels increased, platelet aggregability and platelet count increased; prothrombin and factors VII, VIII, IX, X increased

Hepatic: Cholestatic jaundice, hepatic hemangiomas enlarged

Neuromuscular & skeletal: Arthralgias, chorea, leg cramps

Local: Thrombophlebitis

Ocular: Contact lens intolerance, retinal vascular thrombosis, corneal curvature steepening

Respiratory: Asthma exacerbation, pulmonary thromboembolism

Miscellaneous: Anaphylactoid/anaphylactic reactions, carbohydrate intolerance

Metabolism/Transport Effects Based on estradiol and estrone: **Substrate** of CYP1A2 (major), 2A6 (minor), 2B6 (minor), 2C9 (minor), 2C19 (minor), 2D6 (minor), 2E1 (minor), 3A4 (major); **Inhibits** CYP1A2 (weak); **Induces** CYP3A4 (weak)

Drug Interactions

Corticosteroids (Systemic): Estrogen Derivatives may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CYP1A2 Inducers (Strong): May increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (Estrogenic Properties): May enhance the adverse/toxic effect of Estrogen Derivatives. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Ropinirole: Estrogen Derivatives may increase the serum concentration of Ropinirole. *Risk C: Monitor therapy*

Somatropin: Estrogen Derivatives may diminish the therapeutic effect of Somatropin. Shown to be a concern with oral hormone replacement therapy in postmenopausal women. *Risk D: Consider therapy modification*

Thyroid Products: Estrogen Derivatives may diminish the therapeutic effect of Thyroid Products. *Risk C: Monitor therapy*

Tipranavir: Estrogen Derivatives may enhance the dermatologic adverse effect of Tipranavir. The combination of tipranavir/ritonavir and ethinyl estradiol/norethindrone was associated with a high incidence of skin rash. Tipranavir may decrease the serum concentration of Estrogen Derivatives. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (routine use increases estrogen level and risk of breast cancer).

Food: Grapefruit juice may increase estrogen levels, leading to increased adverse effects.

Herb/Nutraceutical: St John's wort may decrease levels. Herbs with estrogenic properties may enhance the adverse/toxic effect of estrogen derivatives; examples include alfalfa, black cohosh, bloodroot, hops, kudzu, licorice, red clover, saw palmetto, soybean, thyme, wild yam, yucca.

Test Interactions Pathologist should be advised of estrogen/progesterone therapy when specimens are submitted. Reduced response to metyrapone test observed with conjugated estrogens (equine).

Monitoring Parameters Yearly physical examination that includes blood pressure and Papanicolaou smear, breast exam, mammogram. Monitor for signs of endometrial cancer in female patients with uterus. Adequate diagnostic measures, including endometrial sampling, if indicated, should be performed to rule out malignancy in all cases of undiagnosed abnormal vaginal bleeding. Monitor for loss of vision, sudden onset of proptosis, diplopia, migraine; signs and symptoms of thromboembolic disorders; glycemic control in patients with diabetes; lipid profiles in patients being treated for hyperlipidemias; thyroid function in patients on thyroid hormone replacement therapy.

Menopausal symptoms: Assess need for therapy at 3- to 6-month intervals

Nursing: Physical Assessment/Monitoring Assess potential for interactions with other pharmacological agents or herbal products patient may be taking (eg, increased potential for decreased levels/effects or increased potential for toxicity or thrombolic events). Assess results of annual gynecological exam, therapeutic effectiveness, need for continued treatment, and adverse effects (eg, thromboembolism, hypertension, edema, CNS changes) on a regular basis during therapy. **Note:** Before prescribing estrogen therapy to postmenopausal women, the risks and benefits must be weighed for each patient. Women should be informed of these risks and benefits, as well as possible effects of progestin when added to estrogen therapy. Estrogens with or without progestin should be used for shortest duration possible consistent with treatment goals and periodic assessment of risk:benefit should be made. Caution patients with diabetes to monitor glucose levels closely (may impair glucose tolerance). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report. Remind patient about the importance of frequent self-breast exams and the need for annual gynecological exam. **Pregnancy risk factor X:** Determine that patient is not pregnant before starting therapy. Do not give to females of childbearing age unless patient is capable of complying with contraceptive use. Advise patient about contraceptive measures as appropriate.

Monitoring: Lab TestsYearly Papanicolaou smear, mammogram. Adequate diagnostic measures, including endometrial sampling, if indicated, should be performed to rule out malignancy in all cases of undiagnosed abnormal vaginal bleeding.

Patient EducationDo not take any new medication during therapy without consulting prescriber. Take exactly as directed. Routine use of alcohol may increase estrogen level and risk of breast cancer. Annual gynecologic and regular self-breast exams are important. If you have diabetes, monitor glucose levels closely (may impair glucose tolerance). You may experience nausea, vomiting or abdominal pain (small, frequent meals may help); dizziness or mental depression (use caution when driving); rash; hair loss; headache; or breast pain, increased/decreased libido, or enlargement/tenderness of breasts. difficult/painful menstrual cycles. Report significant swelling of extremities; sudden acute pain in legs or calves, chest, or abdomen; shortness of breath; severe headache or vomiting; sudden blindness; weakness or numbness of arm or leg; unusual vaginal bleeding; yellowing of skin or eyes; unusual bruising or bleeding; any alteration or decrease in mental alertness or acuity; or other persistent adverse reactions. You may become intolerant to wearing contact lenses, notify prescriber if this occurs. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant while taking this medication. Consult prescriber for appropriate contraceptive measures. This medication may cause fetal defects and should not be used during pregnancy. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

0.625 mg (30): $51.99

0.9 mg (30): $51.33

1.25 mg (30): $51.99

Mechanism of ActionConjugated A/synthetic estrogens contain a mixture of 9 synthetic estrogen substances, including sodium estrone sulfate, sodium equilin sulfate, sodium 17 alpha-dihydroequilin, sodium 17 alpha-estradiol and sodium 17 beta-dihydroequilin. Estrogens are responsible for the development and maintenance of the female reproductive system and secondary sexual characteristics. Estradiol is the principle intracellular human estrogen and is more potent than estrone and estriol at the receptor level; it is the primary estrogen secreted prior to menopause. Following menopause, estrone and estrone sulfate are more highly produced. Estrogens modulate the pituitary secretion of gonadotropins, luteinizing hormone, and follicle-stimulating hormone through a negative feedback system; estrogen replacement reduces elevated levels of these hormones in postmenopausal women.

Pharmacodynamics/Kinetics

Absorption: Well absorbed over a period of several hours

Protein-binding: Sex hormone-binding globulin (SHBG) and albumin

Metabolism: Hepatic via CYP3A4; estradiol is converted to estrone and estriol; also undergoes enterohepatic recirculation; estrone sulfate is the main metabolite in postmenopausal women

Excretion: Urine (primarily estriol, also as estradiol, estrone, and conjugates)

Pharmacotherapy PearlsNot biologically equivalent to conjugated estrogens from equine source. Contains 9 unique estrogenic compounds (equine source contains at least 10 active estrogenic compounds).

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, headache, depression, insomnia, nervousness, irritability, and mood disturbances

Mental Health: Effects on Psychiatric TreatmentThe Women's Health Initiative (WHI) Memory Study reported an increased risk of developing dementia in postmenopausal women ≥65 years of age during 4 years of treatment with oral conjugated equine estrogens and medroxyprogesterone acetate relative to placebo (1.8% vs 0.9%). Relative risk was 2.05 (95% CI 1.21-3.48). Therefore, estrogens and progestins should not be used for the prevention of dementia. The WHI also reported an increased risk of stroke (29 vs 21 per 10,000 women-years) compared to women receiving placebo. The increase in risk was observed after the first year and persisted. May cause hypertriglyceridemia; monitor in patients receiving antipsychotics especially clozapine, olanzapine, and quetiapine.

Cardiovascular ConsiderationsIt is important to recognize that estrogens may induce or worsen hypertension. These problems are less severe with lower doses. Furthermore, estrogens may precipitate thromboembolic events, particularly in women who smoke. It is important that patients on long-term estrogens undergo monitoring of blood pressure and avoid cigarette use.

Conjugated estrogens (alone or in combination with a progestin) should not be used to prevent coronary heart disease. The HERS trial found that women with coronary disease derived no cardiovascular protection compared to those treated with placebo. In the Women's Health

Initiative trial, a conjugated estrogen/progestin combination did not offer protection against heart disease. No cardiovascular benefits were seen; in fact, more coronary heart disease was observed in the treatment group. Substantial evidence suggests that estrogen therapy increases bone mineralization and therefore may be of added benefit in patients with osteoporosis. Estrogen also has a favorable effect on lipids (decreases total cholesterol and LDL, increases HDL) but increases triglycerides. Therapy should be initiated after careful evaluation of risk:benefit for therapy.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(ES troe jenz, KON joo gate ed, bee, sin THET ik)

U.S. Brand NamesEnjuvia™

Pharmacologic Category[Estrogen Derivative]()

Use: Labeled IndicationsTreatment of moderate-to-severe vasomotor symptoms of menopause; treatment of vulvar and vaginal atrophy associated with menopause; treatment of moderate-to-severe vaginal dryness and pain with intercourse associated with menopause

Dosing: AdultsThe lowest dose that will control symptoms should be used. Medication should be discontinued as soon as possible.

Menopause, moderate-to-severe vasomotor symptoms: Oral: 0.3 mg/day; may be titrated up to 1.25 mg/day. Attempts to discontinue medication should be made at 3- to 6-month intervals.

Vaginal dryness/vulvar and vaginal atrophy associated with menopause: Oral: 0.3 mg/day. Attempts to discontinue medication should be made at 3- to 6-month intervals.

Dosing: ElderlyRefer to adult dosing. A higher incidence of stroke and invasive breast cancer were observed in women >75 years in a WHI substudy using conjugated equine estrogen.

StorageStore at room temperature of 25°C (77°F).

ContraindicationsHypersensitivity to estrogens or any component of the formulation; undiagnosed abnormal vaginal bleeding; history of or current thrombophlebitis or venous thromboembolic disorders (including DVT, PE); active or recent (within 1 year) arterial thromboembolic disease (eg, stroke, MI); carcinoma of the breast; estrogen-dependent tumor; hepatic dysfunction or disease; pregnancy

Warnings/Precautions

Boxed warnings:

- Cardiovascular disease: See “Disease-related concerns” below.
- Dementia: See “Concerns related to adverse effects” below.
- Endometrial carcinoma: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Breast cancer: Estrogens may increase the risk of breast cancer. An increased risk of invasive breast cancer was observed in postmenopausal women using conjugated equine estrogens (CEE) in combination with medroxyprogesterone acetate (MPA); a smaller increase in risk was seen with estrogen therapy alone in observational studies. An increase in abnormal mammograms has also been reported with estrogen and progestin therapy. Estrogen use may lead to severe hypercalcemia in patients with breast cancer and bone metastases; discontinue estrogen if hypercalcemia occurs.
- Dementia: **[U.S. Boxed Warning]: The risk of dementia may be increased in postmenopausal women;** increased incidence was observed in women ≥65 years of age taking CEE alone or in combination with MPA.
- Endometrial carcinoma: **[U.S. Boxed Warning]: Unopposed estrogens may increase the risk of endometrial carcinoma in postmenopausal women.** Estrogens may exacerbate endometriosis. Malignant transformation of residual endometrial implants has been reported posthysterectomy with estrogen only therapy. Consider adding a progestin in women with residual endometriosis posthysterectomy.
- Lipid effects: Estrogen compounds are generally associated with lipid effects such as increased HDL-cholesterol and decreased LDL-cholesterol. Triglycerides may also be increased; use with caution in patients with familial defects of lipoprotein metabolism.
- Retinal vascular thrombosis: Estrogens may cause retinal vascular thrombosis; discontinue permanently if papilledema or retinal vascular lesions are observed on examination.

Disease-related concerns:

- Cardiovascular disease: **[U.S. Boxed Warning]: Estrogens with or without progestin should not be used to prevent coronary heart disease.** Use caution with cardiovascular disease or dysfunction. May increase the risks of hypertension, myocardial infarction (MI), stroke, pulmonary emboli (PE), and deep vein thrombosis; incidence of these effects was shown to be significantly increased in postmenopausal women using CEE in combination with MPA. Nonfatal MI, PE, and thrombophlebitis have also been reported in males taking high doses of CEE (eg, for prostate cancer).
- Cholestatic jaundice: Use caution with history of cholestatic jaundice associated with past estrogen use or pregnancy.
- Diseases exacerbated by fluid retention: Use with caution in patients with diseases which may be exacerbated by fluid retention, including asthma, epilepsy, migraine, diabetes or renal dysfunction.
- Gallbladder disease: Use with caution in patients with gallbladder disease.
- Hepatic hemangiomas: Use with caution in patients with hepatic hemangiomas.

- Hypocalcemia: Use with caution in patients with severe hypocalcemia.
- Porphyria: Use with caution in patients with porphyria.
- SLE: Use with caution in patients with SLE.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children. Prior to puberty, estrogens may cause premature closure of the epiphyses, premature breast development in girls or gynecomastia in boys. Vaginal bleeding and vaginal cornification may also be induced in girls.
- Surgical patients: Whenever possible, estrogens should be discontinued at least 4 weeks prior to and for 2 weeks following elective surgery associated with an increased risk of thromboembolism or during periods of prolonged immobilization.

Other warnings/precautions:

- Risks vs. benefits: Before prescribing estrogen therapy to postmenopausal women, the risks and benefits must be weighed for each patient. Women should be informed of these risks and benefits, as well as possible effects of progestin when added to estrogen therapy. Estrogens with or without progestin should be used for shortest duration possible consistent with treatment goals. Conduct periodic risk:benefit assessments.
- Vaginal dryness/atrophy: When used solely for the treatment of vaginal dryness and pain with intercourse, or vulvar and vaginal atrophy, topical vaginal products should be considered.

Geriatric ConsiderationsEnjuvia™ has not been studied in an elderly population. Before prescribing estrogen therapy to postmenopausal women, the risks and benefits must be weighed for each patient. Women should be informed of these risks and benefits, as well as possible side effects and the return of menstrual bleeding (when cycled with a progestin), and be involved in the decision to prescribe. A higher incidence of stroke and invasive breast cancer was observed in women >75 years of age in a WHI substudy. Oral therapy may be more convenient for vaginal atrophy and urinary incontinence.

Pregnancy ConsiderationsUse during pregnancy is contraindicated.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsThe AAP considers ethinyl estradiol, an estrogen derivative, to be “usually compatible” with breast-feeding. Estrogen has been shown to decrease the quantity and quality of human milk. Use only if clearly needed. Monitor the growth of the infant closely.

Adverse Reactions

>10%:

Central nervous system: Headache (15% to 25%), pain (10% to 19%)

Endocrine & metabolic: Breast pain (up to 14%)

Gastrointestinal: Abdominal pain (4% to 15%), nausea (7% to 12%)

1% to 10%:

Central nervous system: Dizziness (1% to 7%)

Endocrine & metabolic: Dysmenorrhea (1% to 8%)

Gastrointestinal: Flatulence (4% to 7%)

Genitourinary: Vaginitis (2% to 7%)

Neuromuscular & skeletal: Paresthesia (up to 6%)

Respiratory: Bronchitis (up to 7%), rhinitis (4% to 7%), sinusitis (3% to 7%)

Miscellaneous: Flu-like syndrome (4% to 7%)

In addition, the following have been reported with estrogen and/or progestin therapy:

Cardiovascular: Edema, hypertension, MI, stroke, venous thromboembolism

Central nervous system: Epilepsy exacerbation, irritability, mental depression, migraine, mood disturbances, nervousness

Dermatologic: Angioedema, chloasma, erythema multiforme, erythema nodosum, hemorrhagic eruption, hirsutism, loss of scalp hair, melasma, pruritus, rash, urticaria

Endocrine & metabolic: Breast cancer, breast enlargement, breast tenderness, HDL-cholesterol increased, hyper-/hypocalcemia, impaired glucose tolerance, LDL-cholesterol decreased, libido (changes in), serum triglycerides/phospholipids increased, thyroid-binding globulin increased, total thyroid hormone (T_4) increased

Gastrointestinal: Abdominal cramps, bloating, cholecystitis, cholelithiasis, gallbladder disease, pancreatitis, weight gain/loss

Genitourinary: Alterations in frequency and flow of menses, changes in cervical secretions, endometrial cancer, endometrial hyperplasia, increased size of uterine leiomyomata, vaginal candidiasis

Hematologic: Aggravation of porphyria; antithrombin III and antifactor Xa decreased; fibrinogen levels increased; platelet aggregability and platelet count increased; prothrombin and factors VII, VIII, IX, X increased

Hepatic: Cholestatic jaundice, hepatic hemangiomas enlarged

Local: Thrombophlebitis

Neuromuscular & skeletal: Arthralgias, chorea, leg cramps

Ocular: Contact lens intolerance, corneal curvature steepening, retinal vascular thrombosis

Respiratory: Asthma exacerbation, pulmonary thromboembolism

Miscellaneous: Anaphylactoid/anaphylactic reactions, carbohydrate intolerance

Metabolism/Transport EffectsBased on estradiol and estrone: **Substrate** of CYP1A2 (major), 2A6 (minor), 2B6 (minor), 2C9 (minor), 2C19 (minor), 2D6 (minor), 2E1 (minor), 3A4 (major); **Inhibits** CYP1A2 (weak); **Induces** CYP3A4 (weak)

Drug Interactions

Corticosteroids (Systemic): Estrogen Derivatives may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (Estrogenic Properties): May enhance the adverse/toxic effect of Estrogen Derivatives. *Risk C: Monitor therapy*

Ropinirole: Estrogen Derivatives may increase the serum concentration of Ropinirole. *Risk C: Monitor therapy*

Somatropin: Estrogen Derivatives may diminish the therapeutic effect of Somatropin. Shown to be a concern with oral hormone replacement therapy in postmenopausal women. *Risk D: Consider therapy modification*

Thyroid Products: Estrogen Derivatives may diminish the therapeutic effect of Thyroid Products. *Risk C: Monitor therapy*

Tipranavir: Estrogen Derivatives may enhance the dermatologic adverse effect of Tipranavir. The combination of tipranavir/ritonavir and ethinyl estradiol/norethindrone was associated with a high incidence of skin rash. Tipranavir may decrease the serum concentration of Estrogen Derivatives. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (routine use increases estrogen level and risk of breast cancer).

Food: Grapefruit juice may increase estrogen levels, leading to increased adverse effects.

Herb/Nutraceutical: St John's wort may decrease levels. Herbs with estrogenic properties may enhance the adverse/toxic effect of estrogen derivatives; examples include alfalfa, black cohosh, bloodroot, hops, kudzu, licorice, red clover, saw palmetto, soybean, thyme, wild yam, and yucca.

Test InteractionsPathologist should be advised of estrogen/progesterone therapy when specimens are submitted. Reduced response to metyrapone test observed with conjugated estrogens (equine).

Monitoring ParametersYearly physical examination that may include blood pressure and Papanicolaou smear, breast exam, mammogram. Monitor for signs of endometrial cancer in female patients with uterus. Adequate diagnostic measures, including endometrial sampling, if indicated, should be performed to rule out malignancy in all cases of undiagnosed abnormal vaginal bleeding. Monitor for loss of vision, sudden onset of proptosis, diplopia, migraine; signs and symptoms of thromboembolic disorders; glycemic control in patients with diabetes; lipid profiles in patients being treated for hyperlipidemias; thyroid function in patients on thyroid hormone replacement therapy.

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents or herbal products patient may be taking (eg, increased potential for decreased levels/effects or increased potential for toxicity or thrombolic events). Assess results of annual gynecological exam, therapeutic effectiveness, need for continued treatment, and adverse effects (eg, thromboembolism, hypertension, edema, CNS changes) on a regular basis during therapy. **Note:** Before prescribing estrogen therapy to postmenopausal women, the risks and benefits must be weighed for each patient. Women should be informed of these risks and benefits, as well as possible effects of progestin when added to estrogen therapy. Estrogens with or without progestin should be used for shortest duration possible consistent with treatment goals and periodic assessment of risk:benefit should be made. Caution patients with diabetes to monitor glucose levels closely (may impair glucose tolerance). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report. Remind patient about the importance of frequent self-breast exams and the need for annual gynecological exam. **Pregnancy risk factor X:** Determine that patient is not pregnant before starting therapy. Do not give to females of childbearing age unless patient is capable of complying with contraceptive use. Advise patient about contraceptive measures as appropriate.

Monitoring: Lab TestsPapanicolaou smear, mammogram. Adequate diagnostic measures, including endometrial sampling, if indicated, should be performed to rule out malignancy in all cases of undiagnosed abnormal vaginal bleeding.

Patient EducationDo not take any new medication during therapy without consulting prescriber. Take exactly as directed. Routine use of alcohol may increase estrogen level and risk of breast cancer. Annual gynecologic and regular self-breast exams are important. If you have diabetes, monitor glucose levels closely (may impair glucose tolerance). You may experience nausea, vomiting or abdominal pain (small, frequent meals may help); dizziness or mental depression (use caution when driving); rash; hair loss; headache; or breast pain, increased/decreased libido, or enlargement/tenderness of breasts. difficult/painful menstrual cycles. Report significant swelling of extremities; sudden acute pain in legs or calves, chest, or abdomen; shortness of breath; severe headache or vomiting; sudden blindness; weakness or numbness of arm or leg; unusual vaginal bleeding; yellowing of skin or eyes; unusual bruising or bleeding; any alteration or decrease in mental alertness or acuity; or other persistent adverse reactions. You may become intolerant to wearing contact lenses, notify prescriber if this occurs. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant while taking this medication. Consult prescriber for appropriate contraceptive measures. This medication may cause fetal defects and should not be used during pregnancy. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Enjuvia™: 0.3 mg, 0.45 mg, 0.625 mg, 0.9 mg, 1.25 mg

Generic AvailableNo
Pricing: U.S. (www.drugstore.com)

Tablets (Enjuvia)

0.3 mg (30): $49.23

0.45 mg (100): $154.87

0.625 mg (100): $155.61

1.25 mg (100): $154.87

Mechanism of ActionConjugated B/synthetic estrogens contain a mixture of 10 synthetic estrogen substances, including sodium estrone sulfate, sodium equilin sulfate, sodium 17-alpha-dihydroequilin, sodium 17-alpha-estradiol, and sodium 17-beta-dihydroequilin. Estrogens are responsible for the development and maintenance of the female reproductive system and secondary sexual characteristics. Estradiol is the principle intracellular human estrogen and is more potent than estrone and estriol at the receptor level; it is the primary estrogen secreted prior to menopause. Following menopause, estrone and estrone sulfate are more highly produced. Estrogens modulate the pituitary secretion of gonadotropins, luteinizing hormone, and follicle-stimulating hormone through a negative feedback system; estrogen replacement reduces elevated levels of these hormones in postmenopausal women.
Pharmacodynamics/Kinetics

Absorption: Well absorbed over a period of several hours

Protein-binding: Sex hormone-binding globulin (SHBG) and albumin

Metabolism: Hepatic via CYP3A4; estradiol is converted to estrone and estriol; also undergoes enterohepatic recirculation; estrone sulfate is the main metabolite in postmenopausal women

Half-life elimination: Conjugated estrone: 8-20 hours; conjugated equilin: 5-17 hours

Excretion: Urine (primarily estriol, also as estradiol, estrone, and conjugates)

Pharmacotherapy PearlsNot biologically equivalent to conjugated estrogens from equine source. Contains 10 unique estrogenic compounds (equine source contains at least 10 active estrogenic compounds).
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause dizziness, irritability, depression, mood disturbances, and nervousness
Mental Health: Effects on Psychiatric TreatmentThe risk of dementia may be increased in postmenopausal women. Increased incidence of dementia was observed in women ≥65 years of age who were taking conjugated equine estrogens alone or in combination with medroxyprogesterone acetate. May increase triglycerides; combined use with clozapine, olanzapine, and quetiapine may produce an additive risk. Nausea is common; combined use with lithium, valproic acid, carbamazepine, and SSRIs may produce an additive risk. Carbamazepine and St John's wort may reduce the effectiveness or estrogens.

U.S. Brand NamesPremphase®; Prempro™

Canadian Brand NamesPremphase®; Premplus®; Prempro™

Pharmacologic CategoryEstrogen and Progestin Combination

Use: Labeled IndicationsWomen with an intact uterus: Treatment of moderate-to-severe vasomotor symptoms associated with menopause; treatment of atrophic vaginitis; osteoporosis (prophylaxis)

Dosing: Adults

Treatment of moderate-to-severe vasomotor symptoms associated with menopause or treatment of atrophic vaginitis in females with an intact uterus: (**Note:** The lowest dose that will control symptoms should be used; medication should be discontinued as soon as possible): Oral:

Premphase®: One maroon conjugated estrogen 0.625 mg tablet daily on days 1 through 14 and one light blue conjugated estrogen 0.625 mg/MPA 5 mg tablet daily on days 15 through 28; re-evaluate patients at 3- and 6-month intervals to determine if treatment is still necessary; monitor patients for signs of endometrial cancer; rule out malignancy if unexplained vaginal bleeding occurs

Prempro™: One conjugated estrogen 0.3 mg/MPA 1.5 mg tablet daily; re-evaluate at 3-and 6-month intervals to determine if therapy is still needed; dose may be increased to a maximum of one conjugated estrogen 0.625 mg/MPA 5 mg tablet daily in patients with bleeding or spotting, once malignancy has been ruled out

Osteoporosis prophylaxis in females with an intact uterus: Oral:

Premphase®: One maroon conjugated estrogen 0.625 tablet daily on days 1 through 14 and one light blue conjugated estrogen 0.625 mg/MPA 5 mg tablet daily on days 15 through 28; monitor patients for signs of endometrial cancer; rule out malignancy if unexplained vaginal bleeding occurs

Prempro™: One conjugated estrogen 0.3 mg/MPA 1.5 mg tablet daily; dose may be increased to one conjugated estrogen 0.625 mg/MPA 5 mg tablet daily; in patients with bleeding or spotting, once malignancy has been ruled out

Dosing: ElderlyRefer to adult dosing. A higher incidence of stroke and breast cancer was observed in women >75 years in a WHI substudy.

Dietary ConsiderationsAdministration with food decreases nausea, administer with food. Ensure adequate calcium and vitamin D intake when used for the prevention of osteoporosis.

StorageStore at room temperature 20°C to 25°C (68°F to 77°F).

ContraindicationsHypersensitivity to conjugated estrogens, medroxyprogesterone (MPA), or any component of the formulation; undiagnosed abnormal vaginal bleeding; history of or current thrombophlebitis or venous thromboembolic disorders (including DVT, PE); active or recent (within 1 year) arterial thromboembolic disease (eg, stroke, MI); carcinoma of the breast; estrogen-dependent tumor; hepatic dysfunction or disease; pregnancy

Allergy Considerations

- Estrogen Allergy

Warnings/Precautions

Boxed warnings:

- Cardiovascular disease: See “Disease-related concerns” below.
- Dementia: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Breast cancer: Estrogens may increase the risk of breast cancer. An increased risk of invasive breast cancer was observed in postmenopausal women using CEE in combination with MPA; a smaller increase in risk was seen with estrogen therapy alone in observational studies. An increase in abnormal mammograms has also been reported with estrogen and progestin therapy. Estrogen use may lead to severe hypercalcemia in patients with breast cancer and bone metastases; discontinue estrogen if hypercalcemia occurs.
- Dementia: **[U.S. Boxed Warning]: The risk of dementia may be increased in postmenopausal women;** increased incidence was observed in

women ≥65 years of age taking CEE alone or in combination with MPA.

- Endometrial cancer: Unopposed estrogens may increase the risk of endometrial carcinoma in postmenopausal women. Estrogens may exacerbate endometriosis. Malignant transformation of residual endometrial implants has been reported posthysterectomy with estrogen only therapy.

- Lipid effects: Estrogen compounds are generally associated with lipid effects such as increased HDL-cholesterol and decreased LDL-cholesterol. Triglycerides may also be increased; use with caution in patients with familial defects of lipoprotein metabolism.

- Retinal vascular thrombosis: Estrogens may cause retinal vascular thrombosis; discontinue permanently if papilledema or retinal vascular lesions are observed on examination.

Disease-related concerns:

- Cardiovascular disease: **[U.S. Boxed Warning]: Estrogens with or without progestin should not be used to prevent coronary heart disease.** Use caution with cardiovascular disease or dysfunction. May increase the risks of hypertension, myocardial infarction (MI), stroke, pulmonary emboli (PE), and deep vein thrombosis; incidence of these effects was shown to be significantly increased in postmenopausal women using conjugated equine estrogens (CEE) in combination with medroxyprogesterone acetate (MPA). Nonfatal MI, PE, and thrombophlebitis have also been reported in males taking high doses of CEE (eg, for prostate cancer).

- Cholestatic jaundice: Use caution with history of cholestatic jaundice associated with past estrogen use or pregnancy.

- Diseases exacerbated by fluid retention: Use with caution in patients with diseases which may be exacerbated by fluid retention, including asthma, epilepsy, migraine, diabetes, or renal dysfunction.

- Gallbladder disease: Use with caution in patients with gallbladder disease.

- Hepatic hemangiomas: Use with caution in patients with hepatic hemangiomas.

- Hypocalcemia: Use with caution in patients with severe hypocalcemia.

- Porphyria: Use with caution in patients with porphyria.

- SLE: Use with caution in patients with SLE.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children. Prior to puberty, estrogens may cause premature closure of the epiphyses, premature breast development in girls, or gynecomastia in boys. Vaginal bleeding and vaginal cornification may also be induced in girls.

- Surgical patients: Whenever possible, should be discontinued at least 4 weeks prior to and for 2 weeks following elective surgery associated with an increased risk of thromboembolism or during periods of prolonged immobilization.

Other warnings/precautions:

- Osteoporosis use: When used solely for the prevention of osteoporosis in women at significant risk, nonestrogen treatment options should be considered.

- Risks vs. benefits: Before prescribing estrogen therapy to postmenopausal women, the risks and benefits must be weighed for each patient. Women should be informed of these risks and benefits, as well as possible effects of progestin when added to estrogen therapy. Estrogens with or without progestin should be used for shortest duration possible consistent with treatment goals. Conduct periodic risk:benefit assessments.

- Vulvar and vaginal atrophy use: When used solely for the treatment of vulvar and vaginal atrophy, topical vaginal products should be considered.

Geriatric ConsiderationsBefore prescribing estrogen therapy to postmenopausal women, the risks and benefits must be weighed for each patient. Women should be informed of these risks and benefits, as well as possible side effects and the return of menstrual bleeding (when cycled with a progestin), and be involved in the decision to prescribe. A higher incidence of stroke and invasive breast cancer was observed in women >75 years in a WHI substudy. Oral therapy may be more convenient for vaginal atrophy and urinary incontinence.
Pregnancy ConsiderationsSee individual agents; use of this combination is contraindicated during pregnancy
LactationEnters breast milk/use caution
Breast-Feeding ConsiderationsSee individual agents.
Adverse Reactions

>10%:

Central nervous system: Headache (28% to 37%), pain (11% to 13%), depression (6% to 11%)

Endocrine & metabolic: Breast pain (32% to 38%), dysmenorrhea (8% to 13%)

Gastrointestinal: Abdominal pain (16% to 23%), nausea (9% to 11%)

Neuromuscular & skeletal: Back pain (13% to 16%)

Respiratory: Pharyngitis (11% to 13%)

Miscellaneous: Infection (16% to 18%), flu-like syndrome (10% to 13%)

1% to 10%:

Cardiovascular: Peripheral edema (3% to 4%)

Central nervous system: Dizziness (3% to 5%)

Dermatologic: Pruritus (5% to 10%), rash (4% to 6%)

Endocrine & metabolic: Leukorrhea (5% to 9%)

Gastrointestinal: Flatulence (8% to 9%), diarrhea (5% to 6%), dyspepsia (5% to 6%)

Genitourinary: Vaginitis (5% to 7%), cervical changes (4% to 5%), vaginal hemorrhage (1% to 3%)

Neuromuscular & skeletal: Weakness (6% to 10%), arthralgia (7% to 9%), leg cramps (3% to 5%), hypertonia (3% to 4%)

Respiratory: Sinusitis (7% to 8%), rhinitis (6% to 8%)

Additional adverse effects reported with conjugated estrogens and/or progestins: Abdominal cramps, acne, abnormal uterine bleeding, aggravation of porphyria, amenorrhea, anaphylactoid reactions, anaphylaxis, antifactor Xa decreased, antithrombin III decreased, appetite changes, bloating, breast enlargement, breast tenderness, cerebral embolism, cerebral thrombosis, chloasma, cholestatic jaundice, cholecystitis, cholelithiasis, chorea, contact lens intolerance, cystitis-like syndrome, decreased carbohydrate tolerance, dizziness; factors VII, VIII, IX, X, XII, VII-X complex, and II-VII-X complex increased; endometrial hyperplasia, erythema multiforme, erythema nodosum, galactorrhea, hemorrhagic eruption, fatigue, fibrinogen increased, impaired glucose tolerance, HDL-cholesterol increased, hirsutism, hypertension, increase in size of uterine leiomyomata, gallbladder disease, insomnia, LDL-cholesterol decreased, libido changes, loss of scalp hair, melasma, migraine, nervousness, optic neuritis, pancreatitis, platelet aggregability and platelet count increased, premenstrual like syndrome, PT and PTT accelerated, pulmonary embolism, pyrexia, retinal thrombosis, somnolence, steepening of corneal curvature, thrombophlebitis, thyroid-binding globulin increased, total thyroid hormone (T_4) increased, triglycerides increased, urticaria, vaginal candidiasis, vomiting, weight gain/loss

Metabolism/Transport Effects

Based on estradiol and estrone: **Substrate** of CYP1A2 (major), 2A6 (minor), 2B6 (minor), 2C9 (minor), 2C19 (minor), 2D6 (minor), 2E1 (minor), 3A4 (major); **Inhibits** CYP1A2 (weak), 2C8 (weak); **Induces** CYP3A4 (weak)

Medroxyprogesterone: **Substrate** of CYP3A4 (major); **Induces** CYP3A4 (weak)

Drug Interactions

Acitretin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk X: Avoid combination*

Aminoglutethimide: May increase the metabolism of Progestins. *Risk D: Consider therapy modification*

Aprepitant: May decrease the serum concentration of Contraceptive (Progestins). *Risk D: Consider therapy modification*

Barbiturates: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

CarBAMazepine: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Estrogen Derivatives may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CYP1A2 Inducers (Strong): May increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Fosaprepitant: May decrease the serum concentration of Contraceptive (Progestins). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Griseofulvin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk X: Avoid combination*

Herbs (Estrogenic Properties): May enhance the adverse/toxic effect of Estrogen Derivatives. *Risk C: Monitor therapy*

Herbs (Progestogenic Properties) (eg, Bloodroot, Yucca): May enhance the adverse/toxic effect of Progestins. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Phenytoin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Rifamycin Derivatives: May decrease the serum concentration of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Ropinirole: Estrogen Derivatives may increase the serum concentration of Ropinirole. *Risk C: Monitor therapy*

Somatropin: Estrogen Derivatives may diminish the therapeutic effect of Somatropin. Shown to be a concern with oral hormone replacement therapy in postmenopausal women. *Risk D: Consider therapy modification*

St Johns Wort: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Thyroid Products: Estrogen Derivatives may diminish the therapeutic effect of Thyroid Products. *Risk C: Monitor therapy*

Tipranavir: Estrogen Derivatives may enhance the dermatologic adverse effect of Tipranavir. The combination of tipranavir/ritonavir and ethinyl estradiol/norethindrone was associated with a high incidence of skin rash. Tipranavir may decrease the serum concentration of Estrogen Derivatives. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Contraceptive (Progestins) may diminish the anticoagulant effect of Vitamin K Antagonists. In contrast, enhanced anticoagulant effects have also been noted with some products. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (routine use increases estrogen level and risk of breast cancer). Ethanol may also increase the risk of osteoporosis.

Food: Folic acid absorption may be decreased.

Herb/Nutraceutical: St John's wort may decrease levels. Avoid black cohosh, dong quai (has estrogenic activity). Avoid red clover, saw palmetto, ginseng (due to potential hormonal effects).

Test InteractionsPathologist should be advised of estrogen/progesterone therapy when specimens are submitted. Reduced response to metyrapone test.

Monitoring ParametersYearly physical examination that includes blood pressure and Papanicolaou smear, breast exam, mammogram. Monitor for signs of endometrial cancer. Adequate diagnostic measures, including endometrial sampling, if indicated, should be performed to rule out malignancy in all cases of undiagnosed abnormal vaginal bleeding. Monitor for loss of vision, sudden onset of proptosis, diplopia, migraine; signs and symptoms of thromboembolic disorders; glycemic control in patients with diabetes; lipid profiles in patients being treated for hyperlipidemias; thyroid function in patients on thyroid hormone replacement therapy.

Menopausal symptoms: Assess need for therapy at 3- to 6-month intervals

Prevention of osteoporosis: Bone density measurement

Nursing: Physical Assessment/MonitoringSee individual agents.

Monitoring: Lab TestsSerum cholesterol, HDL, LDL triglycerides

Patient EducationSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Premphase® [therapy pack contains 2 separate tablet formulations]: Conjugated estrogens 0.625 mg [14 maroon tablets] and conjugated estrogen 0.625 mg/medroxyprogesterone acetate 5 mg [14 light blue tablets] (28s)

Prempro™:

0.3/1.5: Conjugated estrogens 0.3 mg and medroxyprogesterone acetate 1.5 mg (28s)

0.45/1.5: Conjugated estrogens 0.45 mg and medroxyprogesterone acetate 1.5 mg (28s)

0.625/2.5: Conjugated estrogens 0.625 mg and medroxyprogesterone acetate 2.5 mg (28s)

0.625/5: Conjugated estrogens 0.625 mg and medroxyprogesterone acetate 5 mg (28s)

0.625-2.5 mg (28): $62.33

0.625-5 mg (28): $60.25

Mechanism of Action

Conjugated estrogens contain a mixture of estrone sulfate, equilin sulfate, 17 alpha-dihydroequilin, 17 alpha-estradiol, and 17 beta-dihydroequilin. Estrogens are responsible for the development and maintenance of the female reproductive system and secondary sexual characteristics. Estradiol is the principle intracellular human estrogen and is more potent than estrone and estriol at the receptor level; it is the primary estrogen secreted prior to menopause. Following menopause, estrone and estrone sulfate are more highly produced. Estrogens modulate the pituitary secretion of gonadotropins, luteinizing hormone, and follicle-stimulating hormone through a negative feedback system; estrogen replacement reduces elevated levels of these hormones in postmenopausal women.

MPA inhibits gonadotropin production which then prevents follicular maturation and ovulation. In women with adequate estrogen, MPA transforms a proliferative endometrium into a secretory endometrium; when administered with conjugated estrogens, reduces the incidence of endometrial hyperplasia and risk of adenocarcinoma.

Pharmacodynamics/KineticsSee individual agents.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, headache, depression, insomnia, nervousness, irritability, and mood disturbances

Mental Health: Effects on Psychiatric Treatment Barbiturates and carbamazepine may decrease the effects of estrogens; estrogens may affect metabolism of benzodiazepines; monitor for clinical effect. The Women's Health Initiative (WHI) Memory Study reported an increased risk of developing dementia in postmenopausal women ≥65 years of age during 4 years of treatment with oral conjugated equine estrogens and medroxyprogesterone acetate relative to placebo (1.8% vs 0.9%). Relative risk was 2.05 (95% CI 1.21-3.48). Therefore, estrogens and progestins should not be used for the prevention of dementia. The WHI also reported an increased risk of stroke (29 vs 21 per 10,000 women-years) compared to women receiving placebo. The increase in risk was observed after the first year and persisted. May cause hypertriglyceridemia; monitor in patients receiving antipsychotics especially clozapine, olanzapine, and quetiapine.

Cardiovascular Considerations It is important to recognize that estrogens may induce or worsen hypertension. These problems are less severe with lower doses. Furthermore, estrogens may precipitate thromboembolic events, particularly in women who smoke. It is important that patients on long-term estrogens undergo monitoring of blood pressure and avoid cigarette use.

Conjugated estrogens (alone or in combination with a progestin) should not be used to prevent coronary heart disease. The HERS trial found that women with coronary disease derived no cardiovascular protection compared to those treated with placebo. In the Women's Health Initiative trial, a conjugated estrogen/progestin combination did not offer protection against heart disease. No cardiovascular benefits were seen; in fact, more coronary heart disease was observed in the treatment group. Substantial evidence suggests that estrogen therapy increases bone mineralization and therefore may be of added benefit in patients with osteoporosis. Estrogen also has a favorable effect on lipids (decreases total cholesterol and LDL, increases HDL) but increases triglycerides. Therapy should be initiated after careful evaluation of risk:benefit for therapy.

Index Terms Medroxyprogesterone and Estrogens (Conjugated); MPA and Estrogens (Conjugated)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Premarin® may be confused with Primaxin®, Provera®, Remeron®

Pronunciation(ES troe jenz KON joo gate ed, EE kwine)

U.S. Brand NamesPremarin®

Canadian Brand NamesC.E.S.®; Premarin®

Pharmacologic CategoryEstrogen Derivative

Use: Labeled IndicationsTreatment of moderate-to-severe vasomotor symptoms associated with menopause; treatment of vulvar and vaginal atrophy; hypoestrogenism (due to hypogonadism, castration, or primary ovarian failure); prostatic cancer (palliation); breast cancer (palliation); osteoporosis (prophylaxis, postmenopausal women at significant risk only); abnormal uterine bleeding; moderate-to-severe dyspareunia (pain during intercourse) due to vaginal/vulvar atrophy of menopause

Use: Unlabeled/InvestigationalUremic bleeding

Dosing: Adults

Breast cancer palliation, metastatic disease in selected patients (male and female): Oral: 10 mg 3 times/day for at least 3 months

Uremic bleeding (unlabeled use): I.V.: 0.6 mg/kg/day for 5 days

Androgen-dependent prostate cancer palliation (males): Oral: 1.25-2.5 mg 3 times/day

Prevention of postmenopausal osteoporosis: Oral: Initial: 0.3 mg/day, cyclically* or daily, depending on medical assessment of patient. Dose may be adjusted based on bone mineral density and clinical response. The lowest effective dose should be used.

Menopause (moderate to severe vasomotor symptoms): Oral: Initial: 0.3 mg/day. May be given cyclically* or daily, depending on medical assessment of patient. The lowest dose that will control symptoms should be used. Medication should be discontinued as soon as possible.

Vulvar and vaginal atrophy: Oral: Initial: 0.3 mg/day. The lowest dose that will control symptoms should be used. May be given cyclically* or daily, depending on medical assessment of patient. Medication should be discontinued as soon as possible.

Vaginal cream: Intravaginal: 0.5-2 g/day given cyclically*

Moderate-to-severe dyspareunia: Intravaginal: Vaginal cream: 0.5 g twice weekly (eg, Monday and Thursday) or once daily cyclically*

Female hypogonadism: Oral: 0.3-0.625 mg/day given cyclically*; dose may be titrated in 6- to 12-month intervals; progestin treatment should be added to maintain bone mineral density once skeletal maturity is achieved.

Female castration, primary ovarian failure: Oral: 1.25 mg/day given cyclically*; adjust according to severity of symptoms and patient response. For maintenance, adjust to the lowest effective dose.

Abnormal uterine bleeding:

Acute/heavy bleeding:

Oral (unlabeled route): 1.25 mg, may repeat every 4 hours for 24 hours, followed by 1.25 mg once daily for 7-10 days

I.M., I.V.: 25 mg, may repeat in 6-12 hours if needed

Note: Treatment should be followed by a low-dose oral contraceptive; medroxyprogesterone acetate along with or following estrogen therapy can also be given

Nonacute/lesser bleeding: Oral (unlabeled route): 1.25 mg once daily for 7-10 days

***Cyclic administration:** Either 3 weeks on, 1 week off **or** 25 days on, 5 days off

Dosing: ElderlyRefer to adult dosing. A higher incidence of stroke and breast cancer was observed in women >75 years in a WHI substudy.

Dosing: PediatricAdolescents: Refer to adult dosing.

Dosing: Hepatic Impairment

Mild to moderate liver impairment: Dosage reduction of estrogens is recommended.

Severe liver impairment: **Not recommended.**

Administration: I.M.May be administered intramuscularly.
Administration: I.V.Administer I.V. doses slowly to avoid a flushing reaction.
Administration: OralAdminister at bedtime to minimize adverse effects. May be administered without regard to meals.
Administration: OtherVaginal cream: Administer at bedtime to minimize adverse effects. To clean applicator, remove plunger from barrel. Wash with mild soap and warm water; do not boil or use hot water.
Dietary ConsiderationsEnsure adequate calcium and vitamin D intake when used for the prevention of osteoporosis. Powder for reconstitution for injection (25 mg) contains lactose 200 mg.
Storage

Injection: Refrigerate at 2°C to 8°C (36°F to 46°F) prior to reconstitution. Use immediately following reconstitution.

Tablets, vaginal cream: Store at room temperature 20°C to 25°C (68°F to 77°F).

ReconstitutionInjection: Reconstitute with sterile water for injection; slowly inject diluent against side wall of the vial. Agitate gently; do not shake violently.
CompatibilityStable in D_5W and NS.

Y-site administration: Compatible: Heparin with hydrocortisone sodium succinate, potassium chloride, vitamin B complex with C.

Compatibility when admixed: Incompatible: Ascorbic acid.

ContraindicationsHypersensitivity to estrogens or any component of the formulation; undiagnosed abnormal vaginal bleeding; history of or current thrombophlebitis or venous thromboembolic disorders (including DVT, PE); active or recent (within 1 year) arterial thromboembolic disease (eg, stroke, MI); carcinoma of the breast (except in appropriately selected patients being treated for metastatic disease); estrogen-dependent tumor; hepatic dysfunction or disease; pregnancy
Allergy Considerations

- Estrogen Allergy

Warnings/Precautions

Boxed warnings:

- Cardiovascular disease: See “Disease-related concerns” below.

- Dementia: See “Concerns related to adverse effects” below.

- Endometrial carcinoma: See “Concerns related to adverse effects” below.

- Risks vs benefits: See “Other warnings/precautions” below.

Concerns related to adverse effects:

- Breast cancer: Estrogens may increase the risk of breast cancer. An increased risk of invasive breast cancer was observed in postmenopausal women using conjugated estrogens (CE) in combination with medroxyprogesterone acetate (MPA); a smaller increase in risk was seen with estrogen therapy alone in observational studies. An increase in abnormal mammograms has also been reported with estrogen and progestin therapy. Estrogen use may lead to severe hypercalcemia in patients with breast cancer and bone metastases; discontinue estrogen if hypercalcemia occurs.

- Dementia: **[U.S. Boxed Warning]: The risk of dementia may be increased in postmenopausal women;** increased incidence was observed in women ≥65 years of age taking CE alone or in combination with MPA.

- Endometrial carcinoma: [**U.S. Boxed Warning]: Adequate diagnostic measures, including endometrial sampling (if indicated), should be performed to rule out malignancy in all cases of undiagnosed abnormal vaginal bleeding. Unopposed estrogens may increase the risk of endometrial carcinoma in postmenopausal women with an intact uterus.** Risk appears to be associated with long-term use. The use of a progestin should be considered when administering estrogens to postmenopausal women with an intact uterus.

- Lipid effects: Estrogen compounds are generally associated with lipid effects such as increased HDL-cholesterol and decreased LDL-cholesterol. Triglycerides may also be increased; use with caution in patients with familial defects of lipoprotein metabolism.

- Retinal vascular thrombosis: Estrogens may cause retinal vascular thrombosis; discontinue permanently if papilledema or retinal vascular lesions are observed on examination.

- Vaginal bleeding: Presentation of irregular, unresolving vaginal bleeding warrants further evaluation including endometrial sampling, if indicated, to rule out malignancy

Disease-related concerns:

- Cardiovascular disease: **[U.S. Boxed Warning]: Estrogens with or without progestin should not be used to prevent cardiovascular disease.** Use caution with cardiovascular disease or dysfunction. May increase the risks of hypertension, myocardial infarction (MI), stroke, pulmonary emboli (PE), and deep vein thrombosis; incidence of these effects was shown to be significantly increased in postmenopausal women using CE alone or in combination with MPA. Nonfatal MI, PE, and thrombophlebitis have also been reported in males taking high doses of CE (eg, for prostate cancer).

- Cholestatic jaundice: Use caution with history of cholestatic jaundice associated with past estrogen use or pregnancy.

- Diseases exacerbated by fluid retention: Use with caution in patients with diseases which may be exacerbated by fluid retention, including asthma, epilepsy, migraine, diabetes, heart failure, or renal dysfunction.

- Endometriosis: Estrogens may exacerbate endometriosis. Malignant transformation of residual endometrial implants has been reported posthysterectomy with estrogen only therapy. Consider adding a progestin in women with residual endometriosis posthysterectomy.

- Gallbladder disease: Use with caution in patients with gallbladder disease.

- Hepatic hemangiomas: Use with caution in patients with hepatic hemangiomas.

- Hypocalcemia: Use with caution in patients with severe hypocalcemia.

- Porphyria: Use with caution in patients with porphyria.

- SLE: Use with caution in patients with SLE.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children. Prior to puberty, estrogens may cause premature closure of the epiphyses, premature breast development in girls or gynecomastia in boys. Vaginal bleeding and vaginal cornification may also be induced in girls.

- Surgical patients: Whenever possible, estrogens should be discontinued at least 4 weeks prior to and for 2 weeks following elective surgery associated with an increased risk of thromboembolism or during periods of prolonged immobilization.

Dosage form specific issues:

- Vaginal cream: Use of the vaginal cream may weaken latex found in condoms, diaphragms or cervical caps.

Other warnings/precautions:

- Osteoporosis use: When used solely for prevention of osteoporosis in women at significant risk, nonestrogen treatment options should be considered.

- Risks vs benefits: **[U.S. Boxed Warning]: Estrogens with or without progestin should be used for shortest duration possible at the lowest effective dose consistent with treatment goals.** Before prescribing estrogen therapy to postmenopausal women, the risks and benefits must be weighed for each patient. Women should be informed of these risks and benefits, as well as possible effects of progestin when added to estrogen therapy. Estrogens with or without progestin should be used for shortest duration possible consistent with treatment goals. Conduct periodic risk:benefit assessments.

- Vulvar and vaginal atrophy use: When used solely for the treatment of vulvar and vaginal atrophy, topical vaginal products should be considered. Use caution applying topical products to severely atrophic vaginal mucosa.

Geriatric ConsiderationsBefore prescribing estrogen therapy to postmenopausal women, the risks and benefits must be weighed for each patient. Women should be informed of these risks and benefits, as well as possible side effects and the return of menstrual bleeding (when cycled with a progestin), and be involved in the decision to prescribe. A higher incidence of stroke and invasive breast cancer was observed in women >75 years in a WHI substudy. Oral therapy may be more convenient for vaginal atrophy and urinary incontinence.

Pregnancy ConsiderationsEstrogens are not indicated for use during pregnancy or immediately postpartum. In general, the use of estrogen and progestin as in combination hormonal contraceptives have not been associated with teratogenic effects when inadvertently taken early in pregnancy. These products are contraindicated for use during pregnancy. Use of the vaginal cream may weaken latex found in condoms, diaphragms or cervical caps.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsThe AAP considers ethinyl estradiol, an estrogen derivative, to be “usually compatible” with breast-feeding. Estrogen has been shown to decrease the quantity and quality of human milk. Use only if clearly needed. Monitor the growth of the infant closely.

Adverse Reactions

Note: Percentages reported in postmenopausal women following oral use.

>10%:

Central nervous system: Headache (26% to 32%; placebo 28%)

Endocrine & metabolic: Breast pain (7% to 12%; placebo 9%)

Gastrointestinal: Abdominal pain (15% to 17%)

Genitourinary: Vaginal hemorrhage (2% to 14%)

Neuromuscular & skeletal: Back pain (13% to 14%)

1% to 10%:

Central nervous system: Nervousness (2% to 5%)

Dermatologic: Pruritus (4% to 5%)

Gastrointestinal: Flatulence (6% to 7%)

Genitourinary: Vaginitis (5% to 7%), leukorrhea (4% to 7%), vaginal moniliasis (5% to 6%)

Neuromuscular & skeletal: Weakness (7% to 8%), leg cramps (3% to 7%)

Additional adverse reactions reported with injection or vaginal cream; frequency not defined:

Genitourinary: Cystis-like syndrome, genital pruritus, vulvovaginal discomfort

Local: injection site: Edema, pain, phlebitis

In addition, the following have been reported with estrogen and/or progestin therapy:

Cardiovascular: DVT, edema, hypertension, MI, stroke, superficial venous thrombosis

Central nervous system: Dementia, dizziness, epilepsy exacerbation, headache, irritability, mental depression, migraine, mood disturbances, nervousness

Dermatologic: Angioedema, chloasma, erythema multiforme, erythema nodosum, hemorrhagic eruption, hirsutism, loss of scalp hair, melasma, pruritus, rash, urticaria

Endocrine & metabolic: Breast cancer, breast discharge, breast enlargement, breast tenderness, dysmenorrhea, fibrocystic breast changes, galactorrhea, glucose intolerance, HDL-cholesterol increased, hyper-/hypocalcemia, LDL-cholesterol decreased, libido (changes in), ovarian cancer, serum triglycerides/phospholipids increased, thyroid-binding globulin increased, total thyroid hormone (T_4) increased

Gastrointestinal: Abdominal cramps, bloating, cholecystitis, cholelithiasis, gallbladder disease, ischemic colitis, nausea, pancreatitis, vomiting, weight gain/loss

Genitourinary: Abnormal uterine bleeding/spotting, changes in cervical ectropion, changes in cervical secretions, endometrial cancer, endometrial hyperplasia, increased size of uterine leiomyomata, vaginal candidiasis

Hematologic: Aggravation of porphyria, antithrombin III and antifactor Xa decreased; factors II, II-VII-X complex, VII, VIII, VII-X complex, IX, X , and XII increased; increased beta-thromboglobulin, fibrinogen levels, plasminogen/plasminogen activity, platelet aggregability, platelet count, and prothrombin

Hepatic: Cholestatic jaundice, hepatic hemangiomas enlarged

Neuromuscular & skeletal: Arthralgias, chorea, leg cramps

Local: Thrombophlebitis

Ocular: Contact lens intolerance, corneal curvature steepening, retinal vascular thrombosis

Respiratory: Asthma exacerbation, pulmonary thromboembolism

Miscellaneous: Anaphylactoid/anaphylactic reactions, benign meningioma growth potentiation

Metabolism/Transport Effects

Based on estradiol and estrone: **Substrate** of CYP1A2 (major), 2A6 (minor), 2B6 (minor), 2C9 (minor), 2C19 (minor), 2D6 (minor), 2E1 (minor), 3A4 (major); Inhibits CYP1A2 (weak), 2C8 (weak); Induces CYP3A4 (weak)

Drug Interactions

Corticosteroids (Systemic): Estrogen Derivatives may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CYP1A2 Inducers (Strong): May increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (Estrogenic Properties): May enhance the adverse/toxic effect of Estrogen Derivatives. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Ropinirole: Estrogen Derivatives may increase the serum concentration of Ropinirole. *Risk C: Monitor therapy*

Somatropin: Estrogen Derivatives may diminish the therapeutic effect of Somatropin. Shown to be a concern with oral hormone replacement therapy in postmenopausal women. *Risk D: Consider therapy modification*

Thyroid Products: Estrogen Derivatives may diminish the therapeutic effect of Thyroid Products. *Risk C: Monitor therapy*

Tipranavir: Estrogen Derivatives may enhance the dermatologic adverse effect of Tipranavir. The combination of tipranavir/ritonavir and ethinyl estradiol/norethindrone was associated with a high incidence of skin rash. Tipranavir may decrease the serum concentration of Estrogen Derivatives. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (routine use increases estrogen level and risk of breast cancer). Ethanol may also increase the risk of osteoporosis.

Food: Folic acid absorption may be decreased.

Herb/Nutraceutical: St John's wort may decrease levels. Herbs with estrogenic properties may enhance the adverse/toxic effect of estrogen derivatives; examples include alfalfa, black cohosh, bloodroot, hops, kudzu, licorice, red clover, saw palmetto, soybean, thyme, wild yam, yucca.

Test InteractionsPathologist should be advised of estrogen/progesterone therapy when specimens are submitted. Reduced response to metyrapone test.

Monitoring ParametersRoutine physical examination that includes blood pressure and Papanicolaou smear, breast exam, mammogram. Monitor for signs of endometrial cancer in female patients with uterus. Adequate diagnostic measures, including endometrial sampling, if indicated, should be performed to rule out malignancy in all cases of undiagnosed abnormal vaginal bleeding. Monitor for loss of vision, sudden onset of proptosis, diplopia, migraine; signs and symptoms of thromboembolic disorders; glycemic control in patients with diabetes; lipid profiles in patients being treated for hyperlipidemias; thyroid function in patients on thyroid hormone replacement therapy.

Menopausal symptoms: Assess need for therapy at 3- to 6-month intervals

Prevention of osteoporosis: Bone density measurement

Uremic bleeding: Bleeding time

Reference Range

Children: <10 mcg/24 hours (SI: <35 µmol/day) (values at Mayo Medical Laboratories)

Adults:

Male: 15-40 mcg/24 hours (SI: 52-139 µmol/day)

Female:

Menstruating: 15-80 mcg/24 hours (SI: 52-277 µmol/day)

Postmenopausal: <20 mcg/24 hours (SI: <69 µmol/day)

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents or herbal products patient may be taking (eg, increased potential for decreased levels/effects or increased potential for toxicity or thrombolic events). Assess results of annual gynecological exam, therapeutic effectiveness (dependent on rationale for use), need for continued therapy, and adverse effects (eg, thromboembolism, hypertension, edema, CNS changes) on a regular basis during therapy. **Note:** Before prescribing estrogen therapy to postmenopausal women, the risks and benefits must be weighed for each patient. Women should be informed of these risks and benefits, as well as possible effects of progestin when added to estrogen therapy. Estrogens with or without progestin should be used for shortest duration possible consistent with treatment goals and periodic assessment of risk:benefit should be made. Caution patients with diabetes to monitor glucose levels closely (may impair glucose tolerance). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report. Remind patient about the importance of frequent self-breast exams and the need for annual gynecological exam. Determine that patient is not pregnant before starting therapy. Do not give to females of childbearing age unless patient is capable of complying with contraceptive use. Advise patient about appropriate contraceptive measures as appropriate.

Monitoring: Lab TestsRoutine physical examination that includes blood pressure and Papanicolaou smear. Adequate diagnostic measures, including endometrial sampling, if indicated, should be performed to rule out malignancy in all cases of undiagnosed abnormal vaginal bleeding.

Uremic bleeding: Bleeding time

Patient EducationDo not take any new medication during therapy without consulting prescriber. Use/apply exactly as directed and maintain prescribed cycles or term as prescribed. Routine use of alcohol may increase estrogen level and risk of breast cancer. Annual gynecologic exams and regular self-breast exams are important. If you have diabetes, monitor glucose levels closely (may impair glucose tolerance). You may experience nausea, vomiting, bloating, or abdominal pain (small, frequent meals may help); dizziness or mental depression (use caution when driving); rash; hair loss; headache; breast pain, increased/decreased libido, or enlargement/tenderness of breasts; or difficult/painful menstrual cycles. Report significant swelling of extremities; sudden acute pain in legs, chest, or abdomen; shortness of breath; severe headache or vomiting; CNS changes (dementia, mood disturbances, irritability, nervousness); sudden blindness; weakness or numbness of arm or leg; unusual vaginal bleeding; yellowing of skin or eyes; unusual bruising or bleeding; or other persistent adverse reactions. You may become intolerant to wearing contact lenses; notify prescriber if this occurs. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant while taking this medication. Consult prescriber for appropriate contraceptive measures. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Cream, vaginal:

Premarin®: 0.625 mg/g (42.5 g)

Injection, powder for reconstitution:

Premarin®: 25 mg [contains benzyl alcohol (in diluent), lactose 200 mg]

Tablet:

Premarin®: 0.3 mg, 0.45 mg, 0.625 mg, 0.9 mg, 1.25 mg

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Cream (Premarin)

0.625 mg/g (42.5): $95.99

Tablets (Premarin)

0.3 mg (30): $56.99

0.45 mg (30): $51.99

0.625 mg (30): $50.97

0.9 mg (30): $49.99

1.25 mg (30): $49.99

Mechanism of ActionConjugated estrogens contain a mixture of estrone sulfate, equilin sulfate, 17 alpha-dihydroequilin, 17 alpha-estradiol and 17 beta-dihydroequilin. Estrogens are responsible for the development and maintenance of the female reproductive system and secondary sexual characteristics. Estradiol is the principle intracellular human estrogen and is more potent than estrone and estriol at the receptor level; it is the primary estrogen secreted prior to menopause. Following menopause, estrone and estrone sulfate are more highly produced. Estrogens modulate the pituitary secretion of gonadotropins, luteinizing hormone, and follicle-stimulating hormone through a negative feedback system; estrogen replacement reduces elevated levels of these hormones in postmenopausal women.

Pharmacodynamics/Kinetics

Absorption: Well absorbed

Protein binding: Binds to sex-hormone-binding globulin and albumin

Metabolism: Hepatic via CYP3A4; estradiol is converted to estrone and estriol; also undergoes enterohepatic recirculation (avoided with vaginal administration); estrone sulfite is the main metabolite in postmenopausal women

Half-life elimination: Total estrone: 27 hours

Time to peak, plasma: Total estrone: 7 hours

Excretion: Urine (primarily estriol, also as estradiol, estrone, and conjugates

Related Information

- Depression

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, headache, depression, insomnia, nervousness, irritability, and mood disturbances

Mental Health: Effects on Psychiatric TreatmentBarbiturates and carbamazepine may decrease estrogen levels. The Women's Health Initiative (WHI) Memory Study reported an increased risk of developing dementia in postmenopausal women ≥65 years of age during 4 years of treatment with oral conjugated equine estrogens and medroxyprogesterone acetate relative to placebo (1.8% vs 0.9%). Relative risk was 2.05 (95% CI 1.21-3.48). Therefore, estrogens and progestins should not be used for the prevention of dementia. The WHI also reported an increased risk of stroke (29 vs 21 per 10,000 women-years) compared to women receiving placebo. The increase in risk was observed after the first year and persisted. May cause hypertriglyceridemia; monitor in patients receiving antipsychotics especially clozapine, olanzapine, and quetiapine.

Cardiovascular ConsiderationsIt is important to recognize that estrogens may induce or worsen hypertension. These problems are less severe with lower doses. Furthermore, estrogens may precipitate thromboembolic events, particularly in women who smoke. It is important that patients on long-term estrogens undergo monitoring of blood pressure and avoid cigarette use.

Conjugated estrogens (alone or in combination with a progestin) should not be used to prevent coronary heart disease. The HERS trial found that women with coronary disease derived no cardiovascular protection compared to those treated with placebo. In the Women's Health Initiative trial, a conjugated estrogen/progestin combination did not offer protection against heart disease. No cardiovascular benefits were seen; in fact, more coronary heart disease was observed in the treatment group. Substantial evidence suggests that estrogen therapy increases bone mineralization and therefore may be of added benefit in patients with osteoporosis. Estrogen also has a favorable effect on lipids (decreases total cholesterol and LDL, increases HDL) but increases triglycerides. Therapy should be initiated after careful evaluation of risk:benefit for therapy.

Medication Safety Issues

Sound-alike/look-alike issues:

Estratest® may be confused with Eskalith®, Estratab®, Estratest® H.S.

Estratest® H.S. may be confused with Eskalith®, Estratab®, Estratest®

Pronunciation(ES troe jenz es TER i fied & meth il tes TOS te rone)

U.S. Brand NamesCovaryx™; Covaryx™ HS; E.E.M.T. D.S.; E.E.M.T. H.S.; Estratest®; Estratest® H.S.; Syntest D.S. [DSC]; Syntest H.S. [DSC]

Canadian Brand NamesEstratest®

Pharmacologic CategoryEstrogen and Progestin Combination

Use: Labeled IndicationsVasomotor symptoms of menopause

Dosing: AdultsMenopause (vasomotor symptoms): Oral: Lowest dose that will control symptoms should be chosen, normally given 3 weeks on and 1 week off

Dosing: ElderlyRefer to adult dosing.

Dietary ConsiderationsShould be taken with food at same time each day.

ContraindicationsHypersensitivity to estrogens, methyltestosterone, or any component of the formulation; undiagnosed abnormal vaginal bleeding; history of or current thrombophlebitis or venous thromboembolic disorders (including DVT, PE); active or recent (within 1 year) arterial thromboembolic disease (eg, stroke, MI); carcinoma of the breast, except in appropriately selected patients being treated for metastatic disease; estrogen-dependent tumor; hepatic dysfunction or disease; pregnancy; breast-feeding

Allergy Considerations

- Androgen Allergy
- Estrogen Allergy

Warnings/Precautions

Boxed warnings:

- Cardiovascular disease: See “Disease-related concerns” below.
- Dementia: See “Concerns related to adverse effects” below.
- Endometrial carcinoma: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Breast cancer: Estrogens may increase the risk of breast cancer. An increased risk of invasive breast cancer was observed in postmenopausal women using CEE in combination with MPA; a smaller increase in risk was seen with estrogen therapy alone in observational studies. An increase in abnormal mammograms has also been reported with estrogen and progestin therapy. Estrogen use may lead to severe hypercalcemia in patients with breast cancer and bone metastases; discontinue estrogen if hypercalcemia occurs.
- Dementia: **[U.S. Boxed Warning]: The risk of dementia may be increased in postmenopausal women;** increased incidence was observed in women ≥65 years of age taking CEE alone or in combination with MPA.
- Endometrial cancer: **[U.S. Boxed Warning]: Unopposed estrogens may increase the risk of endometrial carcinoma in postmenopausal women**. Estrogens may exacerbate endometriosis. Malignant transformation of residual endometrial implants has been reported posthysterectomy with estrogen only therapy.
- Lipid effects: Estrogen compounds are generally associated with lipid effects such as increased HDL-cholesterol and decreased LDL-cholesterol. Triglycerides may also be increased; use with caution in patients with familial defects of lipoprotein metabolism.
- Retinal vascular thrombosis: Estrogens may cause retinal vascular thrombosis; discontinue permanently if papilledema or retinal vascular lesions are observed on examination.

Disease-related concerns:

- Cardiovascular disease: **[U.S. Boxed Warning]: Estrogens with or without progestin should not be used to prevent coronary heart disease.** Use caution with cardiovascular disease or dysfunction. May increase the risks of hypertension, myocardial infarction (MI), stroke, pulmonary emboli (PE), and deep vein thrombosis; incidence of these effects was shown to be significantly increased in postmenopausal women using conjugated equine estrogens (CEE) in combination with medroxyprogesterone acetate (MPA). Nonfatal MI, PE, and thrombophlebitis have also been reported in males taking high doses of CEE (eg, for prostate cancer).

- Cholestatic jaundice: Use caution with history of cholestatic jaundice associated with past estrogen use or pregnancy.

- Diseases exacerbated by fluid retention: Use with caution in patients with diseases which may be exacerbated by fluid retention, including asthma, epilepsy, migraine, diabetes, or renal dysfunction.

- Gallbladder disease: Use with caution in patients with gallbladder disease.

- Hepatic hemangiomas: Use with caution in patients with hepatic hemangiomas.

- Hypocalcemia: Use with caution in patients with severe hypocalcemia.

- Porphyria: Use with caution in patients with porphyria.

- SLE: Use with caution in patients with SLE.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children. Prior to puberty, estrogens may cause premature closure of the epiphyses, premature breast development in girls, or gynecomastia in boys. Vaginal bleeding and vaginal cornification may also be induced in girls.

- Surgical patients: Whenever possible, should be discontinued at least 4 weeks prior to and for 2 weeks following elective surgery associated with an increased risk of thromboembolism or during periods of prolonged immobilization.

Other warnings/precautions:

- Risks vs. benefits: Before prescribing estrogen therapy to postmenopausal women, the risks and benefits must be weighed for each patient. Women should be informed of these risks and benefits, as well as possible effects of progestin when added to estrogen therapy. Estrogens with or without progestin should be used for shortest duration possible consistent with treatment goals. Conduct periodic risk:benefit assessments.

Pregnancy Risk FactorX
Pregnancy ConsiderationsRefer to Estrogens (Esterified) monograph.
Adverse Reactions1% to 10%:

Cardiovascular: Increase in blood pressure, edema, thromboembolic disorder

Central nervous system: Depression, headache

Dermatologic: Chloasma, melasma

Endocrine & metabolic: Breast tenderness, change in menstrual flow, hypercalcemia

Gastrointestinal: Nausea, vomiting

Hepatic: Cholestatic jaundice

Metabolism/Transport EffectsBased on estrone: **Substrate** of CYP1A2 (major), 2B6 (minor), 2C9 (minor), 2E1 (minor), 3A4 (major)
Drug Interactions

Corticosteroids (Systemic): Estrogen Derivatives may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CycloSPORINE: Androgens may enhance the hepatotoxic effect of CycloSPORINE. Androgens may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

CYP1A2 Inducers (Strong): May increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (Estrogenic Properties): May enhance the adverse/toxic effect of Estrogen Derivatives. *Risk C: Monitor therapy*

Ropinirole: Estrogen Derivatives may increase the serum concentration of Ropinirole. *Risk C: Monitor therapy*

Somatropin: Estrogen Derivatives may diminish the therapeutic effect of Somatropin. Shown to be a concern with oral hormone replacement therapy in postmenopausal women. *Risk D: Consider therapy modification*

Thyroid Products: Estrogen Derivatives may diminish the therapeutic effect of Thyroid Products. *Risk C: Monitor therapy*

Tipranavir: Estrogen Derivatives may enhance the dermatologic adverse effect of Tipranavir. The combination of tipranavir/ritonavir and ethinyl estradiol/norethindrone was associated with a high incidence of skin rash. Tipranavir may decrease the serum concentration of Estrogen Derivatives. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Androgens may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Monitoring ParametersYearly physical examination that includes blood pressure and Papanicolaou smear, breast exam, mammogram. Monitor for signs of endometrial cancer. Adequate diagnostic measures, including endometrial sampling, if indicated, should be performed to rule out malignancy in all cases of undiagnosed abnormal vaginal bleeding. Monitor for loss of vision, sudden onset of proptosis, diplopia, migraine; signs and symptoms of thromboembolic disorders; glycemic control in patients with diabetes; lipid profiles in patients being treated for hyperlipidemias; thyroid function in patients on thyroid hormone replacement therapy.

Menopausal symptoms: Assess need for therapy at 3- to 6-month intervals

Monitoring: Lab TestsYearly Papanicolaou smear, mammogram. Monitor for signs of endometrial cancer. Adequate diagnostic measures, including endometrial sampling, if indicated, should be performed to rule out malignancy in all cases of undiagnosed abnormal vaginal bleeding.

Menopausal symptoms: Assess need for therapy at 3- to 6-month intervals

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Tablet: Esterified estrogens 1.25 mg and methyltestosterone 2.5 mg [contains tartrazine]; esterified estrogen 0.625 mg and methyltestosterone 1.25 mg

Covaryx™: Esterified estrogens 1.25 mg and methyltestosterone 2.5 mg [contains tartrazine]

Covaryx™ H.S.: Esterified estrogens 1.25 mg and methyltestosterone 2.5 mg [contains tartrazine]

Estratest®: Esterified estrogen 1.25 mg and methyltestosterone 2.5 mg

Estratest® H.S.: Esterified estrogen 0.625 mg and methyltestosterone 1.25 mg

E.E.M.T. D.S., Syntest D.S. [DSC]: Esterified estrogen 1.25 mg and methyltestosterone 2.5 mg

E.E.M.T. H.S., Syntest H.S. [DSC]: Esterified estrogen 0.625 mg and methyltestosterone 1.25 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Est Estrogens-Methyltest DS)

1.25-2.5 mg (30): $46.96

Tablets (Est Estrogens-Methyltest HS)

0.625-1.25 mg (30): $43.76

Tablets (Estratest)

1.25-2.5 mg (30): $113.18

Tablets (Estratest H.S.)

0.625-1.25 mg (30): $97.80

Mechanism of Action

Conjugated estrogens: Activate estrogen receptors (DNA protein complex) located in estrogen-responsive tissues. Once activated, regulate transcription of certain genes leading to observed effects.

Testosterone: Increases synthesis of DNA, RNA, and various proteins in target tissues

Pharmacodynamics/KineticsSee individual agents.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, headache, depression, insomnia, nervousness, irritability, and mood disturbances

Mental Health: Effects on Psychiatric TreatmentBarbiturates and carbamazepine may decrease the effects of estrogens; estrogens may affect metabolism of benzodiazepines; monitor for clinical effect. The Women's Health Initiative (WHI) Memory Study reported an increased risk of developing dementia in postmenopausal women ≥65 years of age during 4 years of treatment with oral conjugated equine estrogens and medroxyprogesterone acetate relative to placebo (1.8% vs 0.9%). Relative risk was 2.05 (95% CI 1.21-3.48). Therefore, estrogens and progestins should not be used for the prevention of dementia. The WHI also reported an increased risk of stroke (29 vs 21 per 10,000 women-years) compared to women receiving placebo. The increase in risk was observed after the first year and persisted. May cause hypertriglyceridemia; monitor in patients receiving antipsychotics especially clozapine, olanzapine, and quetiapine.

Index TermsConjugated Estrogen and Methyltestosterone; Esterified Estrogen and Methyltestosterone

Medication Safety Issues

Sound-alike/look-alike issues:

> Estratab® may be confused with Estratest®, Estratest® H.S.

Pronunciation(ES troe jenz, es TER i fied)

U.S. Brand NamesMenest®

Canadian Brand NamesEstratab®; Menest®

Pharmacologic CategoryEstrogen Derivative

Use: Labeled IndicationsTreatment of moderate to severe vasomotor symptoms associated with menopause; treatment of vulvar and vaginal atrophy; hypoestrogenism (due to hypogonadism, castration, or primary ovarian failure); prostatic cancer (palliation); breast cancer (palliation); osteoporosis (prophylaxis, in women at significant risk only)

Dosing: Adults

Prostate cancer (palliation): Oral: 1.25-2.5 mg 3 times/day

Female hypogonadism: Oral: 2.5-7.5 mg of estrogen daily for 20 days followed by a 10-day rest period. Administer cyclically (3 weeks on and 1 week off). If bleeding does not occur by the end of the 10-day period, repeat the same dosing schedule; the number of courses dependent upon the responsiveness of the endometrium. If bleeding occurs before the end of the 10-day period, begin an estrogen-progestin cyclic regimen of 2.5-7.5 mg esterified estrogens daily for 20 days. During the last 5 days of estrogen therapy, give an oral progestin. If bleeding occurs before regimen is concluded, discontinue therapy and resume on the fifth day of bleeding.

Menopause, moderate to severe vasomotor symptoms: Oral: 1.25 mg/day administered cyclically (3 weeks on and 1 week off). If patient has not menstruated within the last 2 months or more, cyclic administration is started arbitrary. If the patient is menstruating, cyclical administration is started on day 5 of the bleeding. For short-term use only and should be discontinued as soon as possible. Re-evaluate at 3- to 6-month intervals for tapering or discontinuation of therapy.

Atopic vaginitis and kraurosis vulvae: Oral: 0.3 to ≥1.25 mg/day, depending on the tissue response of the individual patient. Administer cyclically. For short-term use only and should be discontinued as soon as possible. Re-evaluate at 3- to 6-month intervals for tapering or discontinuation of therapy.

Breast cancer (palliation): Oral: 10 mg 3 times/day for at least 3 months

Osteoporosis in postmenopausal women: Oral: Initial: 0.3 mg/day and increase to a maximum daily dose of 1.25 mg/day; initiate therapy as soon as possible after menopause; cyclically or daily, depending on medical assessment of patient. Monitor patients with an intact uterus for signs of endometrial cancer; rule out malignancy if unexplained vaginal bleeding occurs

Female castration and primary ovarian failure: Oral: 1.25 mg/day, cyclically. Adjust dosage upward or downward, according to the severity of symptoms and patient response. For maintenance, adjust dosage to lowest level that will provide effective control.

Dosing: ElderlyRefer to adult dosing. A higher incidence of stroke and invasive breast cancer were observed in women >75 years in a WHI substudy using conjugated equine estrogen.

Dosing: Hepatic Impairment

Mild to moderate liver impairment: Dosage reduction of estrogens is recommended.

Severe liver impairment: **Not recommended**.

Dietary ConsiderationsShould be taken with food at same time each day. Ensure adequate calcium and vitamin D intake when used for the prevention of osteoporosis.

StorageStore below 30°C (86°F). Protect from moisture.

ContraindicationsHypersensitivity to estrogens or any component of the formulation; undiagnosed abnormal vaginal bleeding; history of or current thrombophlebitis or venous thromboembolic disorders (including DVT, PE); active or recent (within 1 year) arterial thromboembolic disease (eg, stroke, MI); carcinoma of the breast, except in appropriately selected patients being treated for metastatic disease; estrogen-dependent tumor; hepatic dysfunction or disease; pregnancy

Allergy Considerations

- Estrogen Allergy

Warnings/Precautions

Boxed warnings:

- Cardiovascular disease: See “Disease-related concerns” below.

- Dementia: See "Concerns related to adverse effects" below.
- Endometrial carcinoma: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Breast cancer: Estrogens may increase the risk of breast cancer. An increased risk of invasive breast cancer was observed in postmenopausal women using CEE in combination with MPA; a smaller increase in risk was seen with estrogen therapy alone in observational studies. An increase in abnormal mammograms has also been reported with estrogen and progestin therapy. Estrogen use may lead to severe hypercalcemia in patients with breast cancer and bone metastases; discontinue estrogen if hypercalcemia occurs.
- Dementia: **[U.S. Boxed Warning]: The risk of dementia may be increased in postmenopausal women;** increased incidence was observed in women ≥65 years of age taking CEE alone or in combination with MPA.
- Endometrial carcinoma: **[U.S. Boxed Warning]: Unopposed estrogens may increase the risk of endometrial carcinoma in postmenopausal women.** Estrogens may exacerbate endometriosis. Malignant transformation of residual endometrial implants has been reported posthysterectomy with estrogen only therapy. Consider adding a progestin in women with residual endometriosis posthysterectomy.
- Lipid effects: Estrogen compounds are generally associated with lipid effects such as increased HDL-cholesterol and decreased LDL-cholesterol. Triglycerides may also be increased; use with caution in patients with familial defects of lipoprotein metabolism.
- Retinal vascular thrombosis: Estrogens may cause retinal vascular thrombosis; discontinue permanently if papilledema or retinal vascular lesions are observed on examination.

Disease-related concerns:

- Cardiovascular disease: **[U.S. Boxed Warning]: Estrogens with or without progestin should not be used to prevent coronary heart disease.** Use caution with cardiovascular disease or dysfunction. May increase the risks of hypertension, myocardial infarction (MI), stroke, pulmonary emboli (PE), and deep vein thrombosis; incidence of these effects was shown to be significantly increased in postmenopausal women using conjugated equine estrogens (CEE) in combination with medroxyprogesterone acetate (MPA). Nonfatal MI, PE, and thrombophlebitis have also been reported in males taking high doses of CEE (eg, for prostate cancer).
- Cholestatic jaundice: Use caution with history of cholestatic jaundice associated with past estrogen use or pregnancy.
- Diseases exacerbated by fluid retention: Use with caution in patients with diseases which may be exacerbated by fluid retention, including asthma, epilepsy, migraine, diabetes or renal dysfunction.
- Gallbladder disease: Use with caution in patients with gallbladder disease.
- Hepatic hemangiomas: Use with caution in patients with hepatic hemangiomas.
- Hypocalcemia: Use with caution in patients with severe hypocalcemia.
- Porphyria: Use with caution in patients with porphyria.
- SLE: Use with caution in patients with SLE.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children. Prior to puberty, estrogens may cause premature closure of the epiphyses, premature breast development in girls or gynecomastia in boys. Vaginal bleeding and vaginal cornification may also be induced in girls.
- Surgical patients: Whenever possible, estrogens should be discontinued at least 4 weeks prior to and for 2 weeks following elective surgery associated with an increased risk of thromboembolism or during periods of prolonged immobilization.

Other warnings/precautions:

- Osteoporosis use: When used solely for prevention of osteoporosis in women at significant risk, nonestrogen treatment options should be considered.
- Risks vs. benefits: Before prescribing estrogen therapy to postmenopausal women, the risks and benefits must be weighed for each patient. Women should be informed of these risks and benefits, as well as possible effects of progestin when added to estrogen therapy. Estrogens with or without progestin should be used for shortest duration possible consistent with treatment goals. Conduct periodic risk:benefit assessments.
- Vulvar and vaginal atrophy use: When used solely for the treatment of vulvar and vaginal atrophy, topical vaginal products should be considered.

Geriatric ConsiderationsBefore prescribing estrogen therapy to postmenopausal women, the risks and benefits must be weighed for each patient. Women should be informed of these risks and benefits, as well as possible side effects and the return of menstrual bleeding (when cycled with a progestin), and be involved in the decision to prescribe. A higher incidence of stroke and invasive breast cancer were observed in women >75 years in a WHI substudy using conjugated equine estrogen. Oral therapy may be more convenient for vaginal atrophy and urinary incontinence.

Pregnancy Risk FactorX

Pregnancy ConsiderationsIncreased risk of fetal reproductive tract disorders and other birth defects; do not use during pregnancy.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsThe AAP considers ethinyl estradiol, an estrogen derivative, to be "usually compatible" with breast-feeding. Estrogen has been shown to decrease the quantity and quality of human milk; use only if clearly needed; monitor the growth of the infant closely.

Adverse ReactionsFrequency not defined.

Cardiovascular: Edema, hypertension, venous thromboembolism

Central nervous system: Dizziness, headache, mental depression, migraine

Dermatologic: Chloasma, erythema multiforme, erythema nodosum, hemorrhagic eruption, hirsutism, loss of scalp hair, melasma

Endocrine & metabolic: Breast enlargement, breast tenderness, libido (changes in), increased thyroid-binding globulin, increased total thyroid hormone (T_4), increased serum triglycerides/phospholipids, increased HDL-cholesterol, decreased LDL-cholesterol, impaired glucose tolerance, hypercalcemia

Gastrointestinal: Abdominal cramps, bloating, cholecystitis, cholelithiasis, gallbladder disease, nausea, pancreatitis, vomiting, weight gain/loss

Genitourinary: Alterations in frequency and flow of menses, changes in cervical secretions, endometrial cancer, increased size of uterine leiomyomata, vaginal candidiasis

Hematologic: Aggravation of porphyria, decreased antithrombin III and antifactor Xa, increased levels of fibrinogen, increased platelet aggregability and platelet count; increased prothrombin and factors VII, VIII, IX, X

Hepatic: Cholestatic jaundice

Neuromuscular & skeletal: Chorea

Ocular: Contact lens intolerance, corneal curvature steepening

Respiratory: Pulmonary thromboembolism

Miscellaneous: Carbohydrate intolerance

Metabolism/Transport EffectsBased on estrone: **Substrate** of CYP1A2 (major), 2B6 (minor), 2C9 (minor), 2E1 (minor), 3A4 (major)

Drug Interactions

Corticosteroids (Systemic): Estrogen Derivatives may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CYP1A2 Inducers (Strong): May increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (Estrogenic Properties): May enhance the adverse/toxic effect of Estrogen Derivatives. *Risk C: Monitor therapy*

Ropinirole: Estrogen Derivatives may increase the serum concentration of Ropinirole. *Risk C: Monitor therapy*

Somatropin: Estrogen Derivatives may diminish the therapeutic effect of Somatropin. Shown to be a concern with oral hormone replacement therapy in postmenopausal women. *Risk D: Consider therapy modification*

Thyroid Products: Estrogen Derivatives may diminish the therapeutic effect of Thyroid Products. *Risk C: Monitor therapy*

Tipranavir: Estrogen Derivatives may enhance the dermatologic adverse effect of Tipranavir. The combination of tipranavir/ritonavir and ethinyl estradiol/norethindrone was associated with a high incidence of skin rash. Tipranavir may decrease the serum concentration of Estrogen Derivatives. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (routine use increases estrogen level and risk of breast cancer). Ethanol may also increase the risk of osteoporosis.

Food: Folic acid absorption may be decreased.

Herb/Nutraceutical: St John's wort may decrease levels. Herbs with estrogenic properties may enhance the adverse/toxic effect of estrogen derivatives; examples include alfalfa, black cohosh, bloodroot, hops, kudzu, licorice, red clover, saw palmetto, soybean, thyme, wild yam, yucca.

Test InteractionsPathologist should be advised of estrogen/progesterone therapy when specimens are submitted. Reduced response to metyrapone test.

Monitoring ParametersYearly physical examination that includes blood pressure and Papanicolaou smear, breast exam, mammogram. Monitor for signs of endometrial cancer in female patients with uterus. Adequate diagnostic measures, including endometrial sampling, if indicated, should be performed to rule out malignancy in all cases of undiagnosed abnormal vaginal bleeding. Monitor for loss of vision, sudden onset of proptosis, diplopia, migraine; signs and symptoms of thromboembolic disorders; glycemic control in patients with diabetes; lipid profiles in patients being treated for hyperlipidemias; thyroid function in patients on thyroid hormone replacement therapy.

Menopausal symptoms: Assess need for therapy at 3- to 6-month intervals

Prevention of osteoporosis: Bone density measurement

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents or herbal products patient may be taking (eg, increased potential for decreased levels/effects or increased potential for toxicity or thrombolic events). Assess results of annual gynecological exam, therapeutic effectiveness (dependent on rationale for use), need for continued treatment, and adverse effects (eg, thromboembolism, hypertension, edema, CNS changes) on a regular basis during therapy. **Note:** Before prescribing estrogen therapy to postmenopausal women, the risks and benefits must be weighed for each patient. Women should be informed of these risks and benefits, as well as possible effects of progestin when added to estrogen therapy. Estrogens with or without progestin should be used for shortest duration possible consistent with treatment goals and periodic assessment of risk:benefit should be made. Caution patients with diabetes to monitor glucose levels closely (may impair glucose tolerance). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report. Remind patient about the importance of frequent self-breast exams and the need for annual gynecological exam. **Pregnancy risk factor X:** Determine that patient is not pregnant before starting therapy. Do not give to females of childbearing age unless patient is capable of complying with contraceptive use. Advise patient about contraceptive measures as appropriate.

Monitoring: Lab TestsYearly Papanicolaou smear, mammogram. Adequate diagnostic measures, including endometrial sampling, if indicated, should be performed to rule out malignancy in all cases of undiagnosed abnormal vaginal bleeding.

Patient EducationDo not take any new medication during therapy without consulting prescriber. Take exactly as directed and maintain prescribed cycles or term as prescribed. Routine use of alcohol may increase estrogen level and risk of breast cancer. Annual gynecologic and regular self-breast exams are important. If you have diabetes, monitor glucose levels closely (may impair glucose tolerance). You may experience nausea, vomiting or abdominal pain (small, frequent meals may help); dizziness or mental depression (use caution when driving); rash; hair loss; headache; or breast pain, increased/decreased libido, or enlargement/tenderness of breasts. difficult/painful menstrual cycles. Report significant swelling of extremities; sudden acute pain in legs or calves, chest, or abdomen; shortness of breath; severe headache or vomiting; sudden blindness; weakness or numbness of arm or leg; unusual vaginal bleeding; yellowing of skin or eyes; unusual bruising or bleeding, or other persistent adverse reactions. You may become intolerant to wearing contact lenses, notify prescriber if this occurs. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant while taking this medication. Consult prescriber for appropriate contraceptive measures. This medication may cause fetal defects and should not be used during pregnancy. Consult prescriber if breast-feeding.

Dosage FormsTablet: 0.3 mg, 0.625 mg, 1.25 mg, 2.5 mg

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Tablets (Menest)

0.3 mg (30): $27.99

0.625 mg (30): $32.69

1.25 mg (30): $41.15

2.5 mg (30): $61.72

Mechanism of ActionEsterified estrogens contain a mixture of estrogenic substances; the principle component is estrone. Preparations contain 75% to 85% sodium estrone sulfate and 6% to 15% sodium equilin sulfate such that the total is not <90%. Estrogens are responsible for the development and maintenance of the female reproductive system and secondary sexual characteristics. Estradiol is the principle intracellular human estrogen and is more potent than estrone and estriol at the receptor level; it is the primary estrogen secreted prior to menopause. In males and following menopause in females, estrone and estrone sulfate are more highly produced. Estrogens modulate the pituitary secretion of gonadotropins, luteinizing hormone, and follicle-stimulating hormone through a negative feedback system; estrogen replacement reduces elevated levels of these hormones.

Pharmacodynamics/Kinetics

Absorption: Readily

Metabolism: Rapidly hepatic to estrone sulfate, conjugated and unconjugated metabolites; first-pass effect

Excretion: Urine (as unchanged drug and as glucuronide and sulfate conjugates)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, headache, depression, insomnia, nervousness, irritability, and mood disturbances

Mental Health: Effects on Psychiatric TreatmentThe Women's Health Initiative (WHI) Memory Study reported an increased risk of developing dementia in postmenopausal women ≥65 years of age during 4 years of treatment with oral conjugated equine estrogens and medroxyprogesterone acetate relative to placebo (1.8% vs 0.9%). Relative risk was 2.05 (95% CI 1.21-3.48). Therefore, estrogens and progestins should not be used for the prevention of dementia. The WHI also reported an increased risk of stroke (29 vs 21 per 10,000 women-years) compared to women receiving placebo. The increase in risk was observed after the first year and persisted. May cause hypertriglyceridemia; monitor in patients receiving antipsychotics especially clozapine, olanzapine, and quetiapine.

Cardiovascular ConsiderationsIt is important to recognize that estrogens may induce or worsen hypertension. These problems are less severe with lower doses. Furthermore, estrogens may precipitate thromboembolic events, particularly in women who smoke. It is important that patients on long-term estrogens undergo monitoring of blood pressure and avoid cigarette use.

Conjugated estrogens (alone or in combination with a progestin) should not be used to prevent coronary heart disease. The HERS trial found that women with coronary disease derived no cardiovascular protection compared to those treated with placebo. In the Women's Health Initiative trial, a conjugated estrogen/progestin combination did not offer protection against heart disease. No cardiovascular benefits were seen; in fact, more coronary heart disease was observed in the treatment group. Substantial evidence suggests that estrogen therapy increases bone mineralization and therefore may be of added benefit in patients with osteoporosis. Estrogen also has a favorable effect on lipids (decreases total cholesterol and LDL, increases HDL) but increases triglycerides. Therapy should be initiated after careful evaluation of risk:benefit for therapy.

Index TermsEsterified Estrogens

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(ES troe pih pate)

U.S. Brand NamesOgen®; Ortho-Est®

Canadian Brand NamesOgen®

Pharmacologic CategoryEstrogen Derivative

Use: Labeled IndicationsTreatment of moderate to severe vasomotor symptoms associated with menopause; treatment of vulvar and vaginal atrophy; hypoestrogenism (due to hypogonadism, castration, or primary ovarian failure); osteoporosis (prophylaxis, in women at significant risk only)

Dosing: Adults

Menopause, moderate to severe vasomotor symptoms: Oral: Usual dosage range: 0.75-6 mg estropipate daily. Use the lowest dose and regimen that will control symptoms, and discontinue as soon as possible. Attempt to discontinue or taper medication at 3- to 6-month intervals. If a patient with vasomotor symptoms has not menstruated within the last ≥2 months, start the cyclic administration arbitrarily. If the patient has menstruated, start cyclic administration on day 5 of bleeding.

Female hypogonadism: Oral: 1.5-9 mg estropipate daily for the first 3 weeks, followed by a rest period of 8-10 days; use the lowest dose and regimen that will control symptoms. Repeat if bleeding does not occur by the end of the rest period. The duration of therapy necessary to product the withdrawal bleeding will vary according to the responsiveness of the endometrium. If satisfactory withdrawal bleeding does not occur, give an oral progestin in addition to estrogen during the third week of the cycle.

Female castration or primary ovarian failure: Oral: 1.5-9 mg estropipate daily for the first 3 weeks of a theoretical cycle, followed by a rest period of 8-10 days; use the lowest dose and regimen that will control symptoms

Osteoporosis prophylaxis (females): Oral: 0.75 mg estropipate daily for 25 days of a 31-day cycle

Atrophic vaginitis or kraurosis vulvae: Oral: 0.75-6 mg estropipate daily; administer cyclically. Use the lowest dose and regimen that will control symptoms; discontinue as soon as possible.

Dosing: ElderlyRefer to adult dosing. A higher incidence of stroke and invasive breast cancer were observed in women >75 years in a WHI substudy using conjugated equine estrogen.

Dosing: Hepatic Impairment

Mild to moderate liver impairment: Dosage reduction of estrogens is recommended.

Severe liver impairment: **Not recommended.**

Dietary ConsiderationsEnsure adequate calcium and vitamin D intake when used for the prevention of osteoporosis.

StorageTablet: Store below 25°C (77°F).

ContraindicationsHypersensitivity to estrogens or any component of the formulation; undiagnosed abnormal vaginal bleeding; history of or current thrombophlebitis or venous thromboembolic disorders (including DVT, PE); active or recent (within 1 year) arterial thromboembolic disease (eg, stroke, MI); carcinoma of the breast, except in appropriately selected patients being treated for metastatic disease; estrogen-dependent tumor; hepatic dysfunction or disease; pregnancy

Allergy Considerations

- Estrogen Allergy

Warnings/Precautions

Boxed warnings:

- Cardiovascular disease: See “Disease-related concerns” below.
- Dementia: See “Concerns related to adverse effects” below.
- Endometrial carcinoma: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Breast cancer: Estrogens may increase the risk of breast cancer. An increased risk of invasive breast cancer was observed in postmenopausal women using CEE in combination with MPA; a smaller increase in risk was seen with estrogen therapy alone in observational studies. An increase in abnormal mammograms has also been reported with estrogen and progestin therapy. Estrogen use may lead to severe hypercalcemia in patients with breast cancer and bone metastases; discontinue estrogen if hypercalcemia occurs.
- Dementia: **[U.S. Boxed Warning]: The risk of dementia may be increased in postmenopausal women;** increased incidence was observed in women ≥65 years of age taking CEE alone or in combination with MPA.

- Endometrial carcinoma: **[U.S. Boxed Warning]: Unopposed estrogens may increase the risk of endometrial carcinoma in postmenopausal women.** Estrogens may exacerbate endometriosis. Malignant transformation of residual endometrial implants has been reported posthysterectomy with estrogen only therapy. Consider adding a progestin in women with residual endometriosis posthysterectomy.

- Lipid effects: Estrogen compounds are generally associated with lipid effects such as increased HDL-cholesterol and decreased LDL-cholesterol. Triglycerides may also be increased; use with caution in patients with familial defects of lipoprotein metabolism.

- Retinal vascular thrombosis: Estrogens may cause retinal vascular thrombosis; discontinue permanently if papilledema or retinal vascular lesions are observed on examination.

Disease-related concerns:

- Cardiovascular disease: **[U.S. Boxed Warning]: Estrogens with or without progestin should not be used to prevent coronary heart disease.** Use caution with cardiovascular disease or dysfunction. May increase the risks of hypertension, myocardial infarction (MI), stroke, pulmonary emboli (PE), and deep vein thrombosis; incidence of these effects was shown to be significantly increased in postmenopausal women using conjugated equine estrogens (CEE) in combination with medroxyprogesterone acetate (MPA). Nonfatal MI, PE, and thrombophlebitis have also been reported in males taking high doses of CEE (eg, for prostate cancer).

- Cholestatic jaundice: Use caution with history of cholestatic jaundice associated with past estrogen use or pregnancy.

- Diseases exacerbated by fluid retention: Use with caution in patients with diseases which may be exacerbated by fluid retention, including asthma, epilepsy, migraine, diabetes or renal dysfunction.

- Gallbladder disease: Use with caution in patients with gallbladder disease.

- Hepatic hemangiomas: Use with caution in patients with hepatic hemangiomas.

- Hypocalcemia: Use with caution in patients with severe hypocalcemia.

- Porphyria: Use with caution in patients with porphyria.

- SLE: Use with caution in patients with SLE.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children. Prior to puberty, estrogens may cause premature closure of the epiphyses, premature breast development in girls or gynecomastia in boys. Vaginal bleeding and vaginal cornification may also be induced in girls.

- Surgical patients: Whenever possible, estrogens should be discontinued at least 4 weeks prior to and for 2 weeks following elective surgery associated with an increased risk of thromboembolism or during periods of prolonged immobilization.

Other warnings/precaution:

- Osteoporosis use: When used solely for prevention of osteoporosis in women at significant risk, nonestrogen treatment options should be considered.

- Risks vs. benefits: Before prescribing estrogen therapy to postmenopausal women, the risks and benefits must be weighed for each patient. Women should be informed of these risks and benefits, as well as possible effects of progestin when added to estrogen therapy. Estrogens with or without progestin should be used for shortest duration possible consistent with treatment goals. Conduct periodic risk:benefit assessments.

- Vulvar and vaginal atrophy use: When used solely for the treatment of vulvar and vaginal atrophy, topical vaginal products should be considered.

Pregnancy Risk FactorX

Pregnancy ConsiderationsIncreased risk of fetal reproductive tract disorders and other birth defects; do not use during pregnancy.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsThe AAP considers ethinyl estradiol, an estrogen derivative, to be “usually compatible” with breast-feeding. Estrogen has been shown to decrease the quantity and quality of human milk; monitor the growth of the infant closely.

Adverse ReactionsFrequency not defined.

Cardiovascular: Edema, hypertension, venous thromboembolism

Central nervous system: Dizziness, headache, mental depression, migraine

Dermatologic: Chloasma, erythema multiforme, erythema nodosum, hemorrhagic eruption, hirsutism, loss of scalp hair, melasma

Endocrine & metabolic: Breast enlargement, breast tenderness, libido (changes in), increased thyroid-binding globulin, increased total thyroid hormone (T_4), increased serum triglycerides/phospholipids, increased HDL-cholesterol, decreased LDL-cholesterol, impaired glucose tolerance, hypercalcemia

Gastrointestinal: Abdominal cramps, bloating, cholecystitis, cholelithiasis, gallbladder disease, nausea, pancreatitis, vomiting, weight gain/loss

Genitourinary: Alterations in frequency and flow of menses, changes in cervical secretions, endometrial cancer, increased size of uterine leiomyomata, vaginal candidiasis

Hematologic: Aggravation of porphyria, decreased antithrombin III and antifactor Xa, increased levels of fibrinogen, increased platelet aggregability and platelet count; increased prothrombin and factors VII, VIII, IX, X

Hepatic: Cholestatic jaundice

Neuromuscular & skeletal: Chorea

Ocular: Ocular: Contact lens intolerance, corneal curvature steepening

Respiratory: Pulmonary thromboembolism

Miscellaneous: Carbohydrate intolerance

Metabolism/Transport EffectsBased on estrone: **Substrate** of CYP1A2 (major), 2B6 (minor), 2C9 (minor), 2E1 (minor), 3A4 (major)

Drug Interactions

Corticosteroids (Systemic): Estrogen Derivatives may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CYP1A2 Inducers (Strong): May increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (Estrogenic Properties): May enhance the adverse/toxic effect of Estrogen Derivatives. *Risk C: Monitor therapy*

Ropinirole: Estrogen Derivatives may increase the serum concentration of Ropinirole. *Risk C: Monitor therapy*

Somatropin: Estrogen Derivatives may diminish the therapeutic effect of Somatropin. Shown to be a concern with oral hormone replacement therapy in postmenopausal women. *Risk D: Consider therapy modification*

Thyroid Products: Estrogen Derivatives may diminish the therapeutic effect of Thyroid Products. *Risk C: Monitor therapy*

Tipranavir: Estrogen Derivatives may enhance the dermatologic adverse effect of Tipranavir. The combination of tipranavir/ritonavir and ethinyl estradiol/norethindrone was associated with a high incidence of skin rash. Tipranavir may decrease the serum concentration of Estrogen Derivatives. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Routine use increases estrogen level and risk of breast cancer; avoid ethanol. Ethanol may also increase the risk of osteoporosis.

Food: Folic acid absorption may be decreased.

Herb/Nutraceutical: St John's wort may decrease levels. Herbs with estrogenic properties may enhance the adverse/toxic effect of estrogen derivatives; examples include alfalfa, black cohosh, bloodroot, hops, kudzu, licorice, red clover, saw palmetto, soybean, thyme, wild yam, yucca.

Test InteractionsPathologist should be advised of estrogen/progesterone therapy when specimens are submitted. Reduced response to metyrapone test.

Monitoring ParametersYearly physical examination that includes blood pressure and Papanicolaou smear, breast exam, mammogram. Monitor for signs of endometrial cancer in female patients with uterus. Adequate diagnostic measures, including endometrial sampling, if indicated, should be performed to rule out malignancy in all cases of undiagnosed abnormal vaginal bleeding. Monitor for loss of vision, sudden onset of proptosis, diplopia, migraine; signs and symptoms of thromboembolic disorders; glycemic control in patients with diabetes; lipid profiles in patients being treated for hyperlipidemias; thyroid function in patients on thyroid hormone replacement therapy.

Menopausal symptoms: Assess need for therapy at 3- to 6-month intervals

Prevention of osteoporosis: Bone density measurement

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents or herbal products patient may be taking (eg, increased potential for decreased levels/effects or increased potential for toxicity or thromboembolic events). Assess results of annual gynecological exam, therapeutic effectiveness (dependent on rationale for use), need for continued therapy, and adverse effects (eg, thromboembolism, hypertension, edema, CNS changes) on a regular basis during therapy. **Note:** Before prescribing estrogen therapy to postmenopausal women, the risks and benefits must be weighed for each patient. Women should be informed of these risks and benefits, as well as possible effects of progestin when added to estrogen therapy. Estrogens with or without progestin should be used for shortest duration possible consistent with treatment goals and periodic assessment of risk:benefit should be made. Caution patients with diabetes to monitor glucose levels closely (may impair glucose tolerance). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report. Remind patient about the importance of frequent self-breast exams and the need for annual gynecological exam. **Pregnancy risk factor X:** Determine that patient is not pregnant before starting therapy. Do not give to females of childbearing age unless patient is capable of complying with barrier contraceptive use. Advise patient about contraceptive measures as appropriate.

Monitoring: Lab TestsYearly Papanicolaou smear, mammogram

Patient EducationDo not take any new medication during therapy without consulting prescriber. Use/apply exactly as directed and maintain prescribed cycles or term as prescribed. Routine use of alcohol may increase estrogen level and risk of breast cancer. Annual gynecologic exams and regular self-breast exams are important. If you have diabetes, monitor glucose levels closely (may impair glucose tolerance). You may experience nausea, vomiting or abdominal pain (small, frequent meals may help); dizziness or mental depression (use caution when driving); rash; hair loss; headache; or breast pain, change in libido, enlargement and/or tenderness of breasts; difficult or painful menstrual cycles. Report significant swelling of extremities; sudden acute pain in legs or calves, chest, or abdomen; shortness of breath; severe headache or vomiting; sudden blindness; weakness or numbness of arm or leg; unusual vaginal bleeding; yellowing of skin or eyes; unusual bruising or bleeding, or other persistent adverse reactions. You may become intolerant to wearing contact lenses, notify prescriber if this occurs. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant while taking this medication. Consult prescriber for appropriate contraceptive measures. This medication may cause fetal defects and should not be used during pregnancy. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 0.625 mg [estropipate 0.75 mg]; 1.25 mg [estropipate 1.5 mg]; 2.5 mg [estropipate 3 mg]

Ogen®: 0.625 mg [estropipate 0.75 mg]; 1.25 mg [estropipate 1.5 mg]; 2.5 mg [estropipate 3 mg]

Mechanism of ActionEstrogens are responsible for the development and maintenance of the female reproductive system and secondary sexual characteristics. Estradiol is the principle intracellular human estrogen and is more potent than estrone and estriol at the receptor level; it is the primary estrogen secreted prior to menopause. In males and following menopause in females, estrone and estrone sulfate are more highly produced. Estrogens modulate the pituitary secretion of gonadotropins, luteinizing hormone, and follicle-stimulating hormone through a negative feedback system; estrogen replacement reduces elevated levels of these hormones. Estropipate is prepared from purified crystalline estrone that has been solubilized as the sulfate and stabilized with piperazine.

Pharmacodynamics/Kinetics

Absorption: Well absorbed

Metabolism: Hepatic and in target tissues; first-pass effect

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, headache, depression, insomnia, nervousness, irritability, and mood disturbances

Mental Health: Effects on Psychiatric TreatmentThe Women's Health Initiative (WHI) Memory Study reported an increased risk of developing dementia in postmenopausal women ≥65 years of age during 4 years of treatment with oral conjugated equine estrogens and medroxyprogesterone acetate relative to placebo (1.8% vs 0.9%). Relative risk was 2.05 (95% CI 1.21-3.48). Therefore, estrogens and progestins should not be used for the prevention of dementia. The WHI also reported an increased risk of stroke (29 vs 21 per 10,000 women-years) compared to women receiving placebo. The increase in risk was observed after the first year and persisted. May cause hypertriglyceridemia; monitor in patients receiving antipsychotics especially clozapine, olanzapine, and quetiapine.

Index TermsOrtho Est; Piperazine Estrone Sulfate

Medication Safety Issues

Sound-alike/look-alike issues:

Lunesta® may be confused with Neulasta®

Pronunciation(es zoe PIK lone)
U.S. Brand NamesLunesta®
Pharmacologic Category[Hypnotic, Nonbenzodiazepine]
Use: Labeled IndicationsTreatment of insomnia
Use: DentalNot established at this time
Dosing: Adults

Insomnia: Oral: Initial: 2 mg immediately before bedtime (maximum dose: 3 mg)

Concurrent use with strong CYP3A4 inhibitor: 1 mg immediately before bedtime; if needed, dose may be increased to 2 mg

Dosing: Elderly

Difficulty **falling** asleep: Initial: 1 mg before immediately bedtime; maximum dose: 2 mg.

Difficulty **staying** asleep: 2 mg immediately before bedtime.

Dosing: Renal ImpairmentNo adjustment required.
Dosing: Hepatic Impairment

Mild-to-moderate: Use with caution; dosage adjustment unnecessary

Severe: Initial dose: 1 mg; maximum dose: 2 mg

Administration: OralBecause of the rapid onset of action, eszopiclone should be administered immediately prior to bedtime or after the patient has gone to bed and is having difficulty falling asleep. Do not take with, or immediately following, a high-fat meal. Do not crush or break tablet.
Dietary ConsiderationsAvoid taking after a heavy meal; may delay onset.
StorageStore at controlled room temperature of 25°C (77°F).
RestrictionsC-IV

An FDA-approved patient medication guide is available and must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsThere are no contraindications listed within the manufacturer's labeling.
Allergy Considerations

- Eszopiclone Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Abnormal thinking/behavioral changes: Hypnotics/sedatives have been associated with abnormal thinking and behavior changes including decreased inhibition, aggression, bizarre behavior, agitation, hallucinations, and depersonalization. These changes may occur unpredictably and may indicate previously unrecognized psychiatric disorders; evaluate appropriately.
- Amnesia: Can occur, do not take unless a full night's sleep and clearance of the drug from the body are possible.
- CNS depression: May cause CNS depression impairing physical and mental capabilities; patients must be cautioned about performing tasks, which require mental alertness (operating machinery or driving).
- Hypersensitivity reactions: Postmarketing studies have indicated that the use of hypnotic/sedative agents for sleep has been associated with hypersensitivity reactions including anaphylaxis as well as angioedema.
- Sleep-related activities: An increased risk for hazardous sleep-related activities such as sleep-driving; cooking and eating food, and making phone calls while asleep have also been noted.

Disease-related concerns:

- Depression: Use with caution in patients with depression; worsening of depression, including suicidal ideation has been reported with the use of hypnotics. Intentional overdose may be an issue in this population; prescribe least amount of medication needed.
- Drug abuse: Use with caution in patients with a history of drug dependence.
- Hepatic impairment: Use with caution in patients with hepatic impairment; dosage adjustment required with severe impairment.
- Respiratory disease: Use with caution in patients with respiratory compromise, COPD or sleep apnea.

Concurrent drug therapy issues:

- CNS depressants/psychoactive medications: Use with caution in patients receiving other CNS depressants or psychoactive medication; effects with other sedative drugs or ethanol may be potentiated.
- CYP3A4 inhibitors: Use with caution in patients taking strong CYP3A4 inhibitors.

Special populations:

- Elderly: Use with caution in the elderly; dosage adjustment recommended.
- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: Symptomatic treatment of insomnia should be initiated only after careful evaluation of potential causes of sleep disturbance. Failure of sleep disturbance to resolve after 7-10 days may indicate psychiatric and/or medical illness.
- Duration of therapy: Tolerance, as assessed by sleep measurement, did not develop over 6 months of use.
- Rapid onset: Because of the rapid onset of action, administer immediately prior to bedtime or after the patient has gone to bed and is having difficulty falling asleep.
- Withdrawal: Abrupt discontinuance may lead to withdrawal symptoms.

Geriatric ConsiderationsIn subjects >65 years of age, the AUC was increased by 41%. The manufacturer reports that in studies, the pattern of adverse reactions in elderly subjects was not different from that seen in younger adults.
Pregnancy Risk FactorC
Pregnancy ConsiderationsNo evidence of teratogenicity in animal models (high dose). There are no adequate or well-controlled studies in pregnant women; use only if clearly needed.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions

>10%:

Central nervous system: Headache (15% to 21%)

Gastrointestinal: Unpleasant taste (8% to 34%)

1% to 10%:

Cardiovascular: Chest pain, peripheral edema

Central nervous system: Somnolence (8% to 10%), dizziness (5% to 7%), pain (4% to 5%), nervousness (up to 5%), depression (1% to 4%), confusion (up to 3%), hallucinations (1% to 3%), anxiety (1% to 3%), abnormal dreams (1% to 3%), migraine

Dermatologic: Rash (3% to 4%), pruritus (1% to 4%)

Endocrine & metabolic: Libido decreased (up to 3%), dysmenorrhea (up to 3%), gynecomastia (males up to 3%)

Gastrointestinal: Xerostomia (3% to 7%), dyspepsia (2% to 6%), nausea (4% to 5%), diarrhea (2% to 4%), vomiting (up to 3%)

Genitourinary: Urinary tract infection (up to 3%)

Neuromuscular & skeletal: Neuralgia (up to 3%)

Miscellaneous: Infection (5% to 10%), viral infection (3%), accidental injury (up to 3%)

<1% (Limited to life-threatening or important): Abnormal gait, agitation, alopecia, allergic reaction, amenorrhea, anorexia, asthma, ataxia, breast enlargement, breast neoplasm, bronchitis, cholelithiasis, colitis, conjunctivitis, contact dermatitis, cystitis, dehydration, diaphoresis, dry eyes, dyspnea, dysphagia, dysuria, eczema, emotional lability, epistaxis, erythema multiforme, euphoria, facial edema, fever, gout, heat stroke, hematuria, hepatitis, hepatomegaly, herpes zoster, hostility, hypercholesterolemia, hypertension, hypokalemia, kidney calculus, kidney pain, liver damage, maculopapular rash, malaise, mastitis, melena, memory impairment, menorrhagia, myasthenia, mydriasis, myopathy, neck rigidity, neuritis, neuropathy, neurosis, nystagmus, oliguria, paresthesia, photophobia, photosensitivity, pyelonephritis, rectal hemorrhage, reflexes decreased, stomach ulcer, swelling, thrombophlebitis, tinnitus, tongue edema, tremor, twitching, ulcerative stomatitis, urinary frequency, urinary incontinence, urticaria, urethritis, vaginal hemorrhage, vaginitis, vestibular disorder, vertigo, vesiculobullous rash

Postmarketing and/or case reports: Anaphylaxis, angioedema, complex sleep-related behavior (sleep-driving, cooking or eating food, making phone calls)

Metabolism/Transport Effects**Substrate** of CYP2E1 (minor), 3A4 (major)
Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Eszopiclone. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Flumazenil: May diminish the sedative effect of Hypnotics (Nonbenzodiazepine). *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Use caution with concurrent use. Effects are additive and may decrease psychomotor function.

Food: Onset of action may be reduced if taken with or immediately after a heavy meal.

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Nursing: Physical Assessment/MonitoringEvaluate potential causes of insomnia prior to initiating medication. Assess effectiveness and interactions of other medications patient may be taking Assess for history of addiction; long-term use can result in dependence, abuse, or tolerance. After long-term use, taper dosage slowly when discontinuing. Be alert to possibility of anaphylaxis any time during therapy. Monitor for CNS depression, abnormal thinking, and behavior changes. For inpatient use, institute safety measures and monitor effectiveness and adverse reactions. For outpatients, monitor for effectiveness of therapy and adverse reactions at beginning of therapy and periodically with long-term use. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationUse exactly as directed; do not increase dose or frequency or discontinue without consulting prescriber. Drug may cause physical and/or psychological dependence. While using this medication, do not use alcohol or other prescription or OTC medications (especially, pain medications, sedatives, antihistamines, or hypnotics) without consulting prescriber. Take immediately prior to bedtime (quick onset) or when having difficulty falling asleep. Do not use unless you are able to get 8 or more hours of sleep before you must be active again. Swallow whole, do not crush or break tablet. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, dizziness, lightheadedness, or difficulty with coordination (use caution when driving or engaging in tasks requiring alertness until response to drug is known); headache, or unpleasant taste. Report CNS changes (confusion, depression, increased sedation, excitation, severe headache, abnormal thinking, insomnia, or nightmares); respiratory difficulty; or unusual swelling, especially on face or neck. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablets (Lunesta)

1 mg (30): $167.00

2 mg (30): $168.77

3 mg (30): $168.78

Mechanism of ActionMay interact with GABA-receptor complexes at binding domains located close to or allosterically coupled to benzodiazepine receptors.

Pharmacodynamics/Kinetics

Absorption: Rapid; high-fat/heavy meal may delay absorption

Protein binding: 52% to 59%

Metabolism: Hepatic via oxidation and demethylation (CYP2E1, 3A4); 2 primary metabolites; one with activity less than parent.

Half-life elimination: ~6 hours; Elderly (≥65 years): ~9 hours

Time to peak, plasma: ~1 hour

Excretion: Urine (up to 75%, primarily as metabolites; <10% as parent drug)

Related Information

- CMS: Long-Term Care Facility Thresholds
- Nonbenzodiazepine Anxiolytics and Hypnotics

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Unpleasant taste and xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health CommentIn 2007, the FDA requested that all manufacturers of sedative-hypnotic drug products revise labeling to include a greater emphasis on the risks of adverse effects. These risks include severe allergic reactions (anaphylaxis, angioedema) and complex sleep-related behaviors, which may include sleep-driving (driving while not fully awake and with no memory of the event), making phone calls, and preparing and eating food while asleep. Eszopiclone may be associated with a lower potential for abuse compared to benzodiazepines.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Special Alerts

Tumor Necrosis Factor: Alpha Blockers Associated with Unrecognized Invasive Fungal Infections - September 4, 2008

The U.S. Food and Drug Administration (FDA) is alerting healthcare professionals of an increased risk for opportunistic fungal infections in patients treated with antitumor necrosis factor (anti-TNF) agents adalimumab (Humira®), certolizumab pegol (Cimzia®), etanercept (Enbrel®), and infliximab (Remicade®). The FDA has received reports of pulmonary and disseminated cases of histoplasmosis, coccidioidomycosis, blastomycosis, and other fungal infections associated with use of these agents. In some cases, the symptoms of fungal infection (eg, fever, cough, malaise, dyspnea, fatigue) were unrecognized and precluded prompt antifungal treatment, resulting in 12 deaths. In response, the FDA is requiring manufacturers of these agents to strengthen the boxed warning statement in the labeling to further emphasize the risk of invasive fungal infection. Patients should be monitored closely for signs and symptoms suggestive of fungal infection, evidence of which should result in prompt discontinuation of the medication and appropriate diagnostic evaluation. Symptomatic patients should be questioned about their residence in or travel from areas of endemic mycoses, which should prompt consideration of empiric antifungal therapy.

Additional information can be found at: http://www.fda.gov/medwatch/safety/2008/safety08.htm#TNF2

Tumor Necrosis Factor (TNF) Blockers and Malignancy Risk - June 5, 2008

The U.S. Food and Drug Administration (FDA) issued an Early Communication to healthcare professionals regarding a possible association between TNF blocker (adalimumab, certolizumb pegol, etanercept, and infliximab) use and the development of malignancies in children and young adults. Over the last 10 years, the FDA has received ~30 reports of cancer in children or young adults who had been treated with TNF blockers prior to the age of 18 years. TNF blockers were given for the treatment of Juvenile Idiopathic Arthritis (JIA [formerly termed Juvenile Rheumatoid Arthritis]), Crohn’s disease, or other indications in combination with other immunosuppressive medications (eg, azathioprine, 6-mercaptopurine or methotrexate). Approximately half of the reported cancers were lymphomas (Hodgkin’s and non-Hodgkin’s), which are cancers involving the cells of the immune system.

TNF blockers work by suppressing the immune system. The prescribing information for each TNF blocker contains warnings regarding the possible association of malignancy development with use. Malignancies may not be detected in short-term studies; long-term studies are necessary to identify the impact of TNF blocker therapy on malignancy development. The manufacturers of the four TNF blockers available in the U.S. are being asked by the FDA to provide information regarding all cases of cancer reported in children taking TNF blockers. The FDA is expected to report its findings in approximately 6 months, after completing a safety review and evaluation.

Additional information is available at http://www.fda.gov/medwatch/safety/2008/safety08.htm#TNF

Etanercept (Enbrel®): Revised Prescribing Information With the Addition of a Boxed Warning Concerning the Risk of Infection, Including Tuberculosis - May 2008

These product labeling changes have previously been incorporated into the etanercept Lexi-Comp monograph.

The FDA MedWatch alert can be found at: http://www.fda.gov/medwatch/safety/2008/safety08.htm#Enbrel

Pronunciation(et a NER sept)

U.S. Brand NamesEnbrel®

Canadian Brand NamesEnbrel®

Pharmacologic CategoryAntirheumatic, Disease Modifying; Tumor Necrosis Factor (TNF) Blocking Agent

Use: Labeled IndicationsTreatment of moderately- to severely-active rheumatoid arthritis (RA); moderately- to severely-active polyarticular juvenile idiopathic arthritis (JIA); psoriatic arthritis; active ankylosing spondylitis (AS); moderate-to-severe chronic plaque psoriasis

Dosing: Adults

Rheumatoid arthritis, psoriatic arthritis, ankylosing spondylitis: SubQ:

Once-weekly dosing: 50 mg once weekly

Twice-weekly dosing: 25 mg given twice weekly (individual doses should be separated by 72-96 hours)

Plaque psoriasis:

Initial: 50 mg twice weekly, 3-4 days apart (starting doses of 25 or 50 mg once weekly have also been used successfully); maintain initial dose for 3 months

Maintenance dose: 50 mg once weekly

Dosing: ElderlySubQ: Refer to adult dosing. Although greater sensitivity of some elderly patients cannot be ruled out, no overall differences in safety or effectiveness were observed.
Dosing: Pediatric**Juvenile idiopathic arthritis:** Children 2-17 years: SubQ:

Once-weekly dosing: 0.8 mg/kg (maximum: 50 mg/dose) once weekly

Twice-weekly dosing: 0.4 mg/kg (maximum: 25 mg/dose) twice weekly (individual doses should be separated by 72-96 hours)

Administration: OtherAdminister subcutaneously. Rotate injection sites. New injections should be given at least one inch from an old site and never into areas where the skin is tender, bruised, red, or hard. **Note:** If the physician determines that it is appropriate, patients may self-inject after proper training in injection technique.

Powder for reconstitution: Follow package instructions carefully for reconstitution. The maximum amount injected at any single site should not exceed 25 mg.

Solution for injection: May be allowed to reach room temperature prior to injection.

StorageStore prefilled syringes at 2°C to 8°C (36°F to 46°F); protect from light; do not freeze or shake. Powder for reconstitution must be refrigerated at 2°C to 8°C (36°F to 46°F). Do not freeze. Reconstituted vials of etanercept should be administered as soon as possible after reconstitution. If not administered immediately after reconstitution, etanercept may be stored in the vial at 2°C to 8°C (36°F to 46°F) for up to 14 days.
ReconstitutionReconstitute lyophilized powder aseptically with 1 mL sterile bacteriostatic water for injection, USP (supplied); swirl gently, do not shake. Do not filter reconstituted solution during preparation or administration.
Restrictions

An FDA-approved patient medication guide is available and must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to etanercept or any component of the formulation; patients with sepsis (mortality may be increased); active infections (including chronic or local infection)
Warnings/Precautions

Boxed warnings:

• Infections: See "Concerns related to adverse effects" below.

• Tuberculosis: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Anaphylaxis/hypersensitivity reactions: Allergic reactions may occur, but anaphylaxis has not been observed. If an anaphylactic reaction or other serious allergic reaction occurs, administration should be discontinued immediately and appropriate therapy initiated.

- Autoimmune disorder: Positive antinuclear antibody titers have been detected in patients (with negative baselines). Rare cases of autoimmune disorder, including lupus-like syndrome or autoimmune hepatitis, have been reported; monitor and discontinue if symptoms develop.

- Hepatitis B: Rare reactivation of hepatitis B has occurred in chronic carriers of the virus; evaluate prior to initiation and during treatment in patients at risk for hepatitis B infection.

- Infections: **[U.S. Boxed Warning]: Serious and potentially fatal infections have been reported including bacterial sepsis and tuberculosis.** Cases of unrecognized invasive fungal infections (eg, histoplasmosis, blastomycosis, coccidioidomycosis) have also been reported with anti-TNF agent use. Discontinue administration if patient develops a serious infection or sepsis. Caution should be exercised when considering the use in patients with chronic infection, history of recurrent infection, or predisposition to infection (eg, poorly-controlled diabetes or residence/travel from areas of endemic mycoses). Do not give to patients with an active chronic or localized infection. Patients should be educated about the symptoms of infection and closely monitored for signs and symptoms while undergoing treatment.

- Malignancy: Use may affect defenses against malignancies; impact on the development and course of malignancies is not fully defined. As compared to the general population, an increased risk of lymphoma has been noted in clinical trials; however, rheumatoid arthritis has been previously associated with an increased rate of lymphoma.

- Tuberculosis: **[U.S. Boxed Warning]: Tuberculosis (disseminated or extrapulmonary) has been reported in patients receiving etanercept; both reactivation of latent infection and new infections have been reported.** Patients should be evaluated for latent tuberculosis infection with a tuberculin skin test prior to starting therapy. Treatment of latent tuberculosis should be initiated before therapy is used. Some patients who tested negative prior to therapy have developed active infection; monitor for signs and symptoms of tuberculosis in all patients.

Disease-related concerns:

- Demyelinating CNS disease: Use with caution in patients with pre-existing or recent onset CNS demyelinating disorders; rare cases of new onset or exacerbation of CNS demyelinating disorders have occurred; may present with mental status changes and some may be associated with permanent disability. Optic neuritis, transverse myelitis, multiple sclerosis, and new onset or exacerbation of seizures have been reported.

- Heart failure: Use with caution in patients with heart failure or decreased left ventricular function; worsening and new-onset heart failure has been reported.
- Hematologic disorders: Use with caution in patients with a history of significant hematologic abnormalities; has been associated with pancytopenia and aplastic anemia (rare cases in postmarketing experience). Patients must be advised to seek medical attention if they develop signs and symptoms suggestive of blood dyscrasias; discontinue if significant hematologic abnormalities are confirmed.
- Wegener's granulomatosis: Use is not recommended for use in patients with Wegener's granulomatosis who are receiving immunosuppressive therapy due to higher incidence of noncutaneous solid malignancies.

Concurrent drug therapy issues:

- Anakinra: Due to higher incidence of serious infections, should not be used in combination with anakinra unless no satisfactory alternatives exist, and then only with extreme caution.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <2 years of age.
- Varicella virus exposure: Patients with a significant exposure to varicella virus should temporarily discontinue therapy; treatment with varicella zoster immune globulin should be considered.

Dosage form specific issues:

- Latex: Some dosage forms may contain dry natural rubber (latex).

Other warnings/precautions:

- Immunizations: Patients should be brought up to date with all immunizations before initiating therapy. Live vaccines should not be given concurrently; there is no data available concerning secondary transmission of live vaccines in patients receiving therapy.

Geriatric ConsiderationsClinical trials including those ≥65 years of age with rheumatoid arthritis have not demonstrated any differences in safety and efficacy between elderly and younger adults to date. Since elderly have a higher incidence of infections in general, caution should be used, with close monitoring and patient education.

Pregnancy Risk FactorB

Pregnancy ConsiderationsDevelopmental toxicity studies performed in animals have revealed no evidence of harm to the fetus. There are no studies in pregnant women; this drug should be used during pregnancy only if clearly needed. A pregnancy registry has been established to monitor outcomes of women exposed to etanercept during pregnancy (877-311-8972).

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsIt is not known whether etanercept is excreted in human milk. Because many immunoglobulins are excreted in human milk and the potential for serious adverse reactions exists, a decision should be made whether to discontinue nursing or to discontinue the drug, taking into account the importance of the drug to the mother.

Adverse ReactionsPercentages reported for adults except where specified.

>10%:

Central nervous system: Headache (17%; children 19%)

Gastrointestinal: Abdominal pain (5%; children 19%), vomiting (3%; children 13%)

Local: Injection site reaction (14% to 37%; erythema, itching, pain or swelling)

Respiratory: Respiratory tract infection (upper; 12% to 29%), rhinitis (12% to 16%)

Miscellaneous: Infection (35%; children 63%), positive ANA (11%), positive antidouble-stranded DNA antibodies (15% by RIA, 3% by *Crithidia luciliae* assay)

≥3% to 10%:

Cardiovascular: Edema (2% to 8%)

Central nervous system: Dizziness (7%)

Dermatologic: Rash (5%)

Gastrointestinal: Dyspepsia (4%), nausea (children 9%)

Neuromuscular & skeletal: Weakness (5%)

Respiratory: Pharyngitis (7%), respiratory disorder (5%), sinusitis (3%), cough (6%)

<3%, postmarketing, and/or case reports: Abscess, adenopathy, allergic reactions, alopecia, anemia, angioedema, anorexia, aplastic anemia, appendicitis, aseptic meningitis, bursitis, cerebral ischemia, chest pain, cholecystitis, coagulopathy; demyelinating CNS disorders (suggestive of multiple sclerosis, transverse myelitis, or optic neuritis); deep vein thrombosis, depression, diarrhea, dyspnea, erythema multiforme, fatigue, fever, flushing, flu-like syndrome, gastrointestinal hemorrhage, heart failure, hepatitis (autoimmune), hydrocephalus (with normal pressure), hyper-/hypotension; infections (bacterial, fungal, protozoal, viral); interstitial lung disease, intestinal perforation, joint pain, leukopenia, lupus-like syndrome, lymphadenopathy, malignancies (including lymphoma), membranous glomerulopathy, MI, mouth ulcer, multiple sclerosis, myocardial ischemia, neutropenia, ocular inflammation, optic neuritis,

pancytopenia, pancreatitis, paresthesia, polymyositis, pruritus, psoriasis exacerbation, pulmonary disease, pulmonary embolism, renal calculus, sarcoidosis, seizure, stroke, Stevens-Johnson syndrome, subcutaneous nodules, taste disturbances, thrombocytopenia, thrombophlebitis, toxic epidermal necrolysis, transaminases increased, tuberculosis, tuberculous arthritis, urinary tract infection, urticaria, vasculitis (cutaneous), weight gain, xerophthalmia, xerostomia

Drug Interactions

Abatacept: Anti-TNF Agents may enhance the adverse/toxic effect of Abatacept. An increased risk of serious infection during concomitant use has been reported. *Risk D: Consider therapy modification*

Anakinra: Anti-TNF Agents may enhance the adverse/toxic effect of Anakinra. An increased risk of serious infection during concomitant use has been reported. *Risk X: Avoid combination*

Cyclophosphamide: Etanercept may enhance the adverse/toxic effect of Cyclophosphamide. An increased risk of solid cancer development may be present. *Risk D: Consider therapy modification*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Rilonacept: Anti-TNF Agents may enhance the adverse/toxic effect of Rilonacept. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Echinacea may decrease the therapeutic effects of etanercept (avoid concurrent use).

Monitoring Parameters

Signs and symptoms of infection (prior to and during therapy); latent TB screening prior to therapy initiation

Nursing: Physical Assessment/MonitoringMonitor for signs and symptoms of infection. Assess for liver dysfunction. Monitor effectiveness of therapy (eg, pain, range of motion, mobility, ADL function, inflammation). Assess knowledge/teach patient appropriate administration (injection technique and needle disposal if self-administered), possible side effects/interventions, and adverse symptoms to report.

Monitoring: Lab Tests

Latent TB screening prior to therapy initiation

Patient EducationIf self-injecting, follow instructions for injection and disposal of needles exactly. If redness, swelling, or irritation appears at the injection site, contact prescriber. Do not have any vaccinations while using this medication without consulting prescriber first. You may experience headache or dizziness (use caution when driving or engaging in tasks requiring alertness until response to drug is known). If stomach pain or cramping; unusual bleeding or bruising; persistent fever; paleness; blood in vomitus, stool, or urine occurs, stop medication and contact prescriber **immediately**. Also immediately report skin rash, unusual muscle or bone weakness, or signs of respiratory flu or other infection (eg, chills, fever, sore throat, easy bruising or bleeding, mouth sores, unhealed sores). **Breast-feeding precaution:** Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Enbrel®: 25 mg [contains sucrose 10 mg; diluent contains benzyl alcohol]

Injection, solution [preservative free]:

Enbrel®: 50 mg/mL (0.51 mL, 0.98 mL) [contains sucrose 1%; natural rubber/natural latex in packaging]

Mechanism of ActionEtanercept is a recombinant DNA-derived protein composed of tumor necrosis factor receptor (TNFR) linked to the Fc portion of human IgG1. Etanercept binds tumor necrosis factor (TNF) and blocks its interaction with cell surface receptors. TNF plays an important role in the inflammatory processes and the resulting joint pathology of rheumatoid arthritis (RA), polyarticular-course juvenile idiopathic arthritis (JIA), ankylosing spondylitis (AS), and plaque psoriasis.

Pharmacodynamics/Kinetics

Onset of action: ~2-3 weeks; RA: 1-2 weeks

Half-life elimination: RA: SubQ: 72-132 hours

Time to peak: RA: SubQ: 35-103 hours

Excretion: Clearance: Children: 45.9 mL/hour/m^2; Adults: 89 mL/hour (52 mL/hour/m^2)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusDizziness is common; may cause depression
Mental Health: Effects on Psychiatric TreatmentNone reported

Medication Safety Issues

Sound-alike/look-alike issues:

Edecrin® may be confused with Eulexin®, Ecotrin®

Pronunciation(eth a KRIN ik AS id)

U.S. Brand NamesEdecrin®

Canadian Brand NamesEdecrin®

Pharmacologic CategoryDiuretic, Loop

Use: Labeled IndicationsManagement of edema associated with congestive heart failure; hepatic cirrhosis or renal disease; short-term management of ascites due to malignancy, idiopathic edema, and lymphedema

Dosing: AdultsI.V. formulation should be diluted in D_5W or NS (1 mg/mL) and infused over several minutes.

Edema:

Oral: 50-100 mg/day in 1-2 divided doses; may increase in increments of 25-50 mg at intervals of several days to a maximum of 400 mg/24 hours.

I.V.: 0.5-1 mg/kg/dose (maximum: 100 mg/dose); repeat doses not routinely recommended; however, if indicated, repeat doses every 8-12 hours.

Dosing: ElderlyOral: Initial: 25-50 mg/day

Dosing: Pediatric

Edema: Oral: Children: 1 mg/kg/dose once daily; increase at intervals of 2-3 days as needed, to a maximum of 3 mg/kg/day.

Dosing: Renal Impairment

Cl_{cr} <10 mL/minute: Avoid use.

Not removed by hemo- or peritoneal dialysis; supplemental dose is not necessary.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V.Injection should **not** be given SubQ or I.M. due to local pain and irritation. Single I.V. doses should not exceed 100 mg. Administer each 10 mg over a minute.

Administration: I.V. DetailIf a second dose is needed, it is recommended to use a new injection site to avoid possible thrombophlebitis.

pH: 6.3-7.7

Dietary ConsiderationsThis product may cause a potassium loss. Your healthcare provider may prescribe a potassium supplement, another medication to help prevent the potassium loss, or recommend that you eat foods high in potassium, especially citrus fruits. Do not change your diet on your own while taking this medication, especially if you are taking potassium supplements or medications to reduce potassium loss. Too much potassium can be as harmful as too little.

CompatibilityStable in D_5NS, D_5W, LR, NS.

Incompatible with whole blood or its derivatives.

Y-site administration: Compatible: Heparin with hydrocortisone sodium succinate, potassium chloride, vitamin B complex with C.

Compatibility when admixed: Compatible: Chlorpromazine, cimetidine, prochlorperazine, promazine. **Incompatible:** Hydralazine, procainamide, ranitidine, tolazoline, triflupromazine.

Extemporaneously PreparedTo make a 1 mg/mL suspension: Dissolve 120 mg ethacrynic acid powder in a small amount of 10% alcohol. Add a small amount of 50% sorbitol solution and stir. Adjust pH to 7 with 0.1N sodium hydroxide solution. Add sufficient 50% sorbitol solution to make a final volume of 120 mL. (Methylparaben 6 mg and propylparaben 2.4 mg are added as preservatives.) Stable 220 days at room temperature.

Handbook on Extemporaneous Formulations, Bethesda, MD: American Society of Hospital Pharmacists, 1987.

ContraindicationsHypersensitivity to ethacrynic acid or any component of the formulation; anuria; history of severe watery diarrhea caused by this product; infants

Warnings/Precautions

Concerns related to adverse effects:

- Fluid/electrolyte loss: Loop diuretics are potent diuretics; excess amounts can lead to profound diuresis with fluid and electrolyte loss; close medical supervision and dose evaluation are required. Watch for and correct electrolyte disturbances; adjust dose to avoid dehydration.

- Hypersensitivity reactions: Can rarely occur, however, ethacrynic acid has no cross-reactivity to sulfonamides or sulfonylureas.

- Nephrotoxicity: Monitor fluid status and renal function in an attempt to prevent oliguria, azotemia, and reversible increases in BUN and creatinine; close medical supervision of aggressive diuresis required.

- Ototoxicity: Rapid I.V. administration, renal impairment, excessive doses, and concurrent use of other ototoxins is associated with ototoxicity; has been associated with a higher incidence of ototoxicity than other loop diuretics.

Disease-related concerns:

- Cirrhosis: In cirrhosis, avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy.

Concurrent drug therapy issues:

- Antihypertensives: Coadministration of antihypertensives may increase the risk of hypotension.

Geriatric ConsiderationsEthacrynic acid is rarely used because of its increased incidence of ototoxicity as compared to the other loop diuretics.

Pregnancy Risk FactorB

Pregnancy ConsiderationsNo data available. Generally, use of diuretics during pregnancy is avoided due to risk of decreased placental perfusion.

LactationContraindicated

Adverse ReactionsFrequency not defined.

Central nervous system: Headache, fatigue, apprehension, confusion, fever, chills, encephalopathy (patients with pre-existing liver disease); vertigo

Dermatologic: Skin rash, Henoch-Schönlein purpura (in patient with rheumatic heart disease)

Endocrine & metabolic: Hyponatremia, hyperglycemia, variations in phosphorus, CO_2 content, bicarbonate, and calcium; reversible hyperuricemia, gout, hyperglycemia, hypoglycemia (occurred in two uremic patients who received doses above those recommended)

Gastrointestinal: Anorexia, malaise, abdominal discomfort or pain, dysphagia, nausea, vomiting, and diarrhea, gastrointestinal bleeding, acute pancreatitis (rare)

Genitourinary: Hematuria

Hepatic: Jaundice, abnormal liver function tests

Hematology: Agranulocytosis, severe neutropenia, thrombocytopenia

Local: Thrombophlebitis (with intravenous use), local irritation and pain

Ocular: Blurred vision

Otic: Tinnitus, temporary or permanent deafness

Renal: Serum creatinine increased

Drug Interactions

ACE Inhibitors: Loop Diuretics may enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Loop Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: Loop Diuretics may enhance the adverse/toxic effect of Allopurinol. Loop Diuretics may increase the serum concentration of Allopurinol. Specifically, Loop Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Aminoglycosides: Loop Diuretics may enhance the adverse/toxic effect of Aminoglycosides. Specifically, nephrotoxicity and ototoxicity. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Loop Diuretics. *Risk D: Consider therapy modification*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Dofetilide: Loop Diuretics may enhance the QTc-prolonging effect of Dofetilide. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Neuromuscular-Blocking Agents: Loop Diuretics may diminish the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. Loop Diuretics may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the diuretic effect of Loop Diuretics. *Risk C: Monitor therapy*

Phenytoin: May diminish the diuretic effect of Loop Diuretics. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Monitoring ParametersBlood pressure, renal function, serum electrolytes, and fluid status closely, including weight and I & O daily; hearing

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents or herbal products patient may be taking (especially anything that would impact blood pressure or add to risk of ototoxicity). **Infusion:** See Administration. Assess results of laboratory tests, therapeutic effectiveness (according to purpose for use), and adverse response (eg, dehydration, electrolyte imbalance, CNS changes) on a regular basis during therapy. Caution patients with diabetes to monitor glucose levels closely (may cause hyper/hypoglycemia). Teach patient appropriate use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsRenal function, serum electrolytes

Patient EducationInform prescriber of all prescriptions, OTC medications, or herbal products you are taking, and any allergies you have. Do not take any new medication during therapy without consulting prescriber. Take prescribed dose with food early in day. Include orange juice or bananas (or other potassium-rich foods) in your diet, but do not take potassium supplements without consulting prescriber. If you have diabetes, monitor serum glucose closely (this medication may alter glucose levels). May cause postural hypotension (use caution when rising from lying or sitting position, when climbing stairs, or when driving); lightheadedness, dizziness, or drowsiness (use caution driving or when engaging in hazardous activities); diarrhea (buttermilk, boiled milk, or yogurt may help); or decreased accommodation to heat (avoid excessive exercise in hot weather). Report hearing changes (ringing in ears); persistent headache; unusual confusion or nervousness; abdominal pain or blood stool (black stool); palpitations, chest pain, rapid heartbeat; flu-like symptoms; skin rash or itching; blurred vision; swelling of ankles or feet; weight changes of more than 3 lb/day; increased fatigue; or joint/muscle swelling, pain, cramping, or trembling. **Breast-feeding precaution:** Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution, as ethacrynate sodium: 50 mg

Tablet: 25 mg

Generic AvailableNo

ManufacturerMerck & Co

Pricing: U.S. (www.drugstore.com)

Tablets (Edecrin)

25 mg (100): $112.49

Mechanism of ActionInhibits reabsorption of sodium and chloride in the ascending loop of Henle and distal renal tubule, interfering with the chloride-binding cotransport system, thus causing increased excretion of water, sodium, chloride, magnesium, and calcium

Pharmacodynamics/Kinetics

Onset of action: Diuresis: Oral: ~30 minutes; I.V.: 5 minutes

Peak effect: Oral: 2 hours; I.V.: 30 minutes

Duration: Oral: 12 hours; I.V.: 2 hours

Absorption: Oral: Rapid

Protein binding: >90%

Metabolism: Hepatic (35% to 40%) to active cysteine conjugate

Half-life elimination: Normal renal function: 2-4 hours

Excretion: Feces and urine (30% to 60% as unchanged drug)

Related Information

- Heart Failure (Systolic)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness; may rarely cause drowsiness, nervousness, or confusion

Mental Health: Effects on Psychiatric TreatmentRare reports of agranulocytosis; use caution with clozapine and carbamazepine; may increase serum lithium levels, however, more likely with thiazide diuretic

Cardiovascular ConsiderationsLimited use over other loop diuretics because of increased risk of ototoxicity. Hypotensive effect of ethacrynic acid may be more pronounced in patients previously on a diuretic therapy or who have volume depletion.

Anesthesia and Critical Care Concerns/Other ConsiderationsEthacrynic acid has limited use over other loop diuretics because of increased risk of ototoxicity. If given the morning of surgery, it may render the patient volume depleted and blood pressure may be labile during general anesthesia.

Index TermsEthacrynate Sodium

Medication Safety Issues

Sound-alike/look-alike issues:

Myambutol® may be confused with Nembutal®

Pronunciation(e THAM byoo tole)

U.S. Brand NamesMyambutol®

Canadian Brand NamesEtibi®

Pharmacologic CategoryAntitubercular Agent

Use: Labeled IndicationsTreatment of tuberculosis and other mycobacterial diseases in conjunction with other antituberculosis agents

Dosing: Adults

Tuberculosis, active (suggested doses by lean body weight): Oral:

Daily therapy: 15-25 mg/kg

40-55 kg: 800 mg

56-75 kg: 1200 mg

76-90 kg: 1600 mg (maximum dose regardless of weight)

Twice weekly directly observed therapy (DOT): 50 mg/kg

40-55 kg: 2000 mg

56-75 kg: 2800 mg

76-90 kg: 4000 mg (maximum dose regardless of weight)

Three times/week DOT: 25-30 mg/kg (maximum: 2.5 g)

40-55 kg: 1200 mg

56-75 kg: 2000 mg

76-90 kg: 2400 mg (maximum dose regardless of weight)

Note: Used as part of a multidrug regimen. Treatment regimens consist of an initial 2 month phase, followed by a continuation phase of 4 or 7 additional months; frequency of dosing may differ depending on phase of therapy.

Disseminated*Mycobacterium avium*complex (MAC) in patients with advanced HIV infection: Oral: 15 mg/kg ethambutol in combination with azithromycin 600 mg daily

Nontuberculous mycobacterium (*M. kansasii*) (unlabeled use; IDSA guidelines): Oral: 15 mg/kg/day for duration to include 12 months of culture-negative sputum; typically used in combination with rifampin and isoniazid; **Note:** Previous recommendations stated to use 25 mg/kg/day for the initial 2 months of therapy; however, IDSA guidelines state this may be unnecessary given the success of rifampin-based regimens with ethambutol 15 mg/kg/day or omitted altogether.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Treatment of tuberculosis Oral:

Daily therapy: 15-20 mg/kg/day (maximum: 1 g/day)

Twice weekly directly observed therapy (DOT): 50 mg/kg (maximum: 4 g/dose)

See “Note” in adult dosing.

Dosing: Renal Impairment

Cl_{cr} 10-50 mL/minute: Administer every 24-36 hours.

Cl_{cr} <10 mL/minute: Administer every 48 hours.

Slightly dialyzable (5% to 20%); administer dose postdialysis.

Peritoneal dialysis: Dose as for Cl_{cr} <10 mL/minute.

Continuous arteriovenous or venovenous hemofiltration: Administer every 24-36 hours.

Calculations

- Adjusted Body Weight
- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics
- Ideal Body Weight: Adults

Dietary ConsiderationsMay be taken with food as absorption is not affected, may cause gastric irritation.

StorageStore at controlled room temperature of 20°C to 25°C (68°F to 77°F).

ContraindicationsHypersensitivity to ethambutol or any component of the formulation; optic neuritis; use in children, unconscious patients, or any other patient who may be unable to discern and report visual changes

Warnings/Precautions

Concerns related to adverse effects:

- Hepatic toxicity: Has been reported, possibly due to concurrent therapy.

- Optic neuritis: May cause optic neuritis, resulting in decreased visual acuity or other vision changes. Discontinue promptly in patients with changes in vision, color blindness, or visual defects (effects normally reversible, but reversal may require up to a year).

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment; dosage modification recommended.

Special populations:

- Pediatrics: Use only in children whose visual acuity can accurately be determined and monitored (not recommended for use in children <13 years of age unless the benefit outweighs the risk).

Geriatric ConsiderationsSince most elderly patients acquired their tuberculosis before current antituberculin regimens were available, ethambutol is only indicated when patients are from areas where drug resistant *M. tuberculosis* is endemic, in HIV-infected elderly patients, and when drug resistant *M. tuberculosis* is suspected (see dose adjustments for renal impairment).

Pregnancy Risk FactorC

Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women; teratogenic effects have been seen in animals. Ethambutol has been used safely during pregnancy.

LactationEnters breast milk/use caution (AAP considers “compatible”)

Breast-Feeding ConsiderationsThe manufacturer suggests use during breast-feeding only if benefits to the mother outweigh the possible risk to the infant. Some references suggest that exposure to the infant is low and does not produce toxicity, and breast-feeding should not be discouraged. Other references recommend if breast-feeding, monitor the infant for rash, malaise, nausea, or vomiting.

Adverse ReactionsFrequency not defined.

Cardiovascular: Myocarditis, pericarditis

Central nervous system: Headache, confusion, disorientation, malaise, mental confusion, fever, dizziness, hallucinations

Dermatologic: Rash, pruritus, dermatitis, exfoliative dermatitis

Endocrine & metabolic: Acute gout or hyperuricemia

Gastrointestinal: Abdominal pain, anorexia, nausea, vomiting

Hematologic: Leukopenia, thrombocytopenia, eosinophilia, neutropenia, lymphadenopathy

Hepatic: Abnormal LFTs, hepatotoxicity (possibly related to concurrent therapy), hepatitis

Neuromuscular & skeletal: Peripheral neuritis, arthralgia

Ocular: Optic neuritis; symptoms may include decreased acuity, scotoma, color blindness, or visual defects (usually reversible with discontinuation, irreversible blindness has been described)

Renal: Nephritis

Respiratory: Infiltrates (with or without eosinophilia), pneumonitis

Miscellaneous: Anaphylaxis, anaphylactoid reaction; hypersensitivity syndrome (rash, eosinophilia, and organ-specific inflammation)

Drug Interactions

Aluminum Hydroxide: May decrease the absorption of Ethambutol. *Risk D: Consider therapy modification*

Monitoring ParametersBaseline and periodic (monthly) visual testing (each eye individually, as well as both eyes tested together) in patients receiving >15 mg/kg/day; baseline and periodic renal, hepatic, and hematopoietic tests

Nursing: Physical Assessment/MonitoringUse caution in presence of renal insufficiency. Assess results of baseline and periodic laboratory tests, therapeutic effectiveness, and adverse response (eg, CNS changes, neuritis, and ocular changes) on a regular basis during therapy. Teach patient appropriate use (need to adhere to dosing program), possible side effects/appropriate interventions (regular ophthalmic evaluations), and adverse symptoms to report.

Monitoring: Lab TestsBaseline and periodic (monthly) visual testing (each eye individually, as well as both eyes tested together) in patients receiving >15 mg/kg/day; baseline and periodic renal, hepatic, and hematopoietic tests

Patient EducationTake as scheduled, with meals. Avoid missing doses and do not discontinue without consulting prescriber. Avoid aluminum-containing antacids for at least 4 hours following ethambutol. May cause GI distress (small, frequent meals and good oral care may help), dizziness, disorientation, drowsiness (avoid driving or engaging in tasks that require alertness until response to drug is known). You will need to have frequent ophthalmic exams and periodic medical check-ups to evaluate drug effects. Report vision changes, numbness or tingling of extremities, or persistent loss of appetite. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as hydrochloride: 100 mg, 400 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Ethambutol HCl)

400 mg (30): $55.99

Mechanism of ActionSuppresses mycobacteria multiplication by interfering with RNA synthesis

Pharmacodynamics/Kinetics

Absorption: ~80%

Distribution: Widely throughout body; concentrated in kidneys, lungs, saliva, and red blood cells

Relative diffusion from blood into CSF: Adequate with or without inflammation (exceeds usual MICs)

CSF:blood level ratio: Normal meninges: 0%; Inflamed meninges: 25%

Protein binding: 20% to 30%

Metabolism: Hepatic (20%) to inactive metabolite

Half-life elimination: 2.5-3.6 hours; End-stage renal disease: 7-15 hours

Time to peak, serum: 2-4 hours

Excretion: Urine (~50%) and feces (20%) as unchanged drug

Ethanolamine Oleate

Lexi-Drugs Online

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Ethamolin® may be confused with ethanol

Pronunciation(ETH a nol a meen OH lee ate)
U.S. Brand NamesEthamolin®
Pharmacologic CategorySclerosing Agent
Use: Labeled Indications**Orphan drug:** Sclerosing agent used for bleeding esophageal varices
Dosing: AdultsEsophageal varices (sclerotherapy): Injection: 1.5-5 mL per varix, up to 20 mL total or 0.4 mL/kg for a 50 kg patient; doses should be decreased in patients with severe hepatic dysfunction and should receive less than recommended maximum dose
Dosing: ElderlyRefer to adult dosing.
ContraindicationsHypersensitivity to agent or oleic acid
Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis: Fatal anaphylactic shock has been reported following administration.
- Aspiration pneumonia: Fatal aspiration pneumonia has occurred.

Disease-related concerns:

- Cardiorespiratory disease: Use with caution in patients with concomitant cardiorespiratory disease.
- Hepatic impairment: Use with caution in patients with significant liver dysfunction (Child class C); decreased dose recommended.

Special populations:

- Critically-ill patients: Use with caution in critically-ill patients.
- Elderly: Use with caution in the elderly.
- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy Risk FactorC
Adverse Reactions

1% to 10%:

Central nervous system: Pyrexia (1.8%)

Gastrointestinal: Esophageal ulcer (2%), esophageal stricture (1.3%)

Respiratory: Pleural effusion (2%), pneumonia (1.2%)

Miscellaneous: Retrosternal pain (1.6%)

<1%: Esophagitis, perforation, injection necrosis, acute renal failure, anaphylaxis

Drug InteractionsThere are no known significant interactions.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: 5% [50 mg/mL] (2 mL) [contains benzyl alcohol]

Generic AvailableNo
Mechanism of ActionDerived from oleic acid and similar in physical properties to sodium morrhuate; however, the exact mechanism of the hemostatic effect used in endoscopic injection sclerotherapy is not known. Intravenously injected ethanolamine oleate produces a sterile inflammatory response resulting in fibrosis and occlusion of the vein; a dose-related extravascular inflammatory reaction occurs when the drug diffuses through the venous wall. Autopsy results indicate that variceal obliteration occurs secondary to mural necrosis and fibrosis. Thrombosis appears to be a transient reaction.
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported
Index TermsMonoethanolamine

Ethinyl Estradiol and Desogestrel

Apri® may be confused with Apriso™

Ortho-Cept® may be confused with Ortho-Cyclen®

Pronunciation(ETH in il es tra DYE ole & des oh JES trel)

U.S. Brand NamesApri®; Cesia™; Cyclessa®; Desogen®; Kariva™; Mircette®; Ortho-Cept®; Reclipsen™; Solia™; Velivet™

Canadian Brand NamesCyclessa®; Linessa®; Marvelon®; Ortho-Cept®

Pharmacologic CategoryContraceptive; Estrogen and Progestin Combination

Use: Labeled IndicationsPrevention of pregnancy

Use: Unlabeled/InvestigationalTreatment of hypermenorrhea (menorrhagia); pain associated with endometriosis; dysmenorrhea; dysfunctional uterine bleeding

Dosing: AdultsFemales: Contraception: Oral:

Schedule 1 (Sunday starter): Dose begins on first Sunday after onset of menstruation; if the menstrual period starts on Sunday, take first tablet that very same day. **With a Sunday start, an additional method of contraception should be used until after the first 7 days of consecutive administration.**

For 21-tablet package: Dosage is 1 tablet daily for 21 consecutive days, followed by 7 days off of the medication; a new course begins on the 8th day after the last tablet is taken.

For 28-tablet package: Dosage is 1 tablet daily without interruption.

Schedule 2 (Day 1 starter): Dose starts on first day of menstrual cycle taking 1 tablet daily.

For 21-tablet package: Dosage is 1 tablet daily for 21 consecutive days, followed by 7 days off of the medication; a new course begins on the 8th day after the last tablet is taken.

For 28-tablet package: Dosage is 1 tablet daily without interruption.

If all doses have been taken on schedule and one menstrual period is missed, continue dosing cycle. If two consecutive menstrual periods are missed, pregnancy test is required before new dosing cycle is started.

Missed doses **monophasic formulations** (refer to package insert for complete information):

One dose missed: Take as soon as remembered or take 2 tablets next day

Two consecutive doses missed in the first 2 weeks: Take 2 tablets as soon as remembered or 2 tablets next 2 days. **An additional method of contraception should be used for 7 days after missed dose.**

Two consecutive doses missed in week 3 or three consecutive doses missed at any time: Schedule 1 (Sunday starter): Continue to take 1 tablet daily until Sunday, then discard the rest of the pack, and a new pack is started that same day. Schedule 2 (Day 1 starter): Current pack should be discarded, and a new pack started that same day. **An additional method of contraception should be used for 7 days after missed dose.**

Missed doses **biphasic/triphasic formulations** (refer to package insert for complete information):

One dose missed: Take as soon as remembered or take 2 tablets next day.

Two consecutive doses missed in week 1 or week 2 of the pack: Take 2 tablets as soon as remembered and 2 tablets the next day. Resume taking 1 tablet daily until the pack is empty. **An additional method of contraception should be used for 7 days after a missed dose.**

Two consecutive doses missed in week 3 of the pack; **an additional method of contraception must be used for 7 days after a missed dose**:

Schedule 1 (Sunday starter): Take 1 tablet every day until Sunday. Discard the remaining pack and start a new pack of pills on the same day.

Schedule 2 (Day 1 starter): Discard the remaining pack and start a new pack the same day.

Three or more consecutive doses missed; **an additional method of contraception must be used for 7 days after a missed dose**:

Schedule 1 (Sunday starter): Take 1 tablet every day until Sunday; on Sunday, discard the pack and start a new pack.

Schedule 2 (Day 1 starter): Discard the remaining pack and begin new pack of tablets starting on the same day.

Dosing: PediatricFemales: Contraception: Oral: See adult dosing; not to be used prior to menarche.

Dosing: Renal ImpairmentSpecific guidelines not available; use with caution and monitor blood pressure closely. Consider other forms of contraception.

Dosing: Hepatic ImpairmentContraindicated in patients with hepatic impairment.

Administration: OralAdminister at the same time each day.

Dietary ConsiderationsShould be taken at same time each day.

StorageStore at controlled room temperature of 25°C (77°F).

ContraindicationsHypersensitivity to ethinyl estradiol, etonogestrel, desogestrel, or any component of the formulation; history of or current thrombophlebitis or venous thromboembolic disorders (including DVT, PE); active or recent (within 1 year) arterial thromboembolic disease (eg, stroke, MI); cerebral vascular disease, coronary artery disease, valvular heart disease with complications, severe hypertension; diabetes mellitus with vascular involvement; severe headache with focal neurological symptoms; known or suspected breast carcinoma, endometrial cancer, estrogen-dependent neoplasms, undiagnosed abnormal genital bleeding; hepatic dysfunction or tumor, cholestatic jaundice of pregnancy, jaundice with prior combination hormonal contraceptive use; major surgery with prolonged immobilization; heavy smoking (≥15 cigarettes/day) in patients >35 years of age; pregnancy

Allergy Considerations

- Estrogen Allergy

Warnings/Precautions

Boxed warnings:

- Smokers: See “Special populations” below.

Concerns related to adverse effects:

- Breast cancer: The use of combination hormonal contraceptives has been associated with a slight increase in frequency of breast cancer, however, studies are not consistent.
- Glucose intolerance: Combination hormonal contraceptives may cause glucose intolerance.
- Lipid effects: Combination hormonal contraceptives may effect serum triglyceride and lipoprotein levels. Estrogen compounds are generally associated with lipid effects such as increased HDL-cholesterol and decreased LDL-cholesterol. Triglycerides may also be increased; use with caution in patients with familial defects of lipoprotein metabolism.
- Retinal vascular thrombosis: Estrogens may cause retinal vascular thrombosis (has been reported rarely with combination hormonal contraceptives); discontinue permanently if papilledema or retinal vascular lesions are observed on examination.
- Thromboembolism: May increase the risk of thromboembolism.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with risk factors for coronary artery disease; may lead to increased risk of myocardial infarction. May have a dose-related risk of vascular disease and hypertension; women with hypertension should be encouraged to use another form of contraception.
- Depression: Use with caution in patients with depression.
- Diseases exacerbated by fluid retention: Use with caution in patients with diseases which may be exacerbated by fluid retention, including asthma, epilepsy, migraine, diabetes or renal dysfunction.
- Gallbladder disease: May have a dose-related risk of gallbladder disease.
- Migraine: Use with caution in patients with a history of migraine.
- Renal impairment: Women with renal disease should be encouraged to use another form of contraception.

Special populations:

- Pediatrics: Not for use prior to menarche.
- Smokers: **[U.S. Boxed Warning]: The risk of cardiovascular side effects increases in women who smoke cigarettes, especially those who are >35 years of age; women who use combination hormonal contraceptives should be strongly advised not to smoke.**
- Surgical patients: Whenever possible, should be discontinued at least 4 weeks prior to and for 2 weeks following elective surgery associated with an increased risk of thromboembolism or during periods of prolonged immobilization.

Other warnings/precautions:

- HIV infection protection: Combination hormonal contraceptives do not protect against HIV infection or other sexually-transmitted diseases.
- Minimum effective dosage: The minimum dosage combination of estrogen/progestin that will effectively treat the individual patient should be used. New patients should be started on products containing ≤0.035 mg of estrogen per tablet.

Pregnancy Risk FactorX

Pregnancy ConsiderationsPregnancy should be ruled out prior to treatment and discontinued if pregnancy occurs. In general, the use of combination hormonal contraceptives when inadvertently taken early in pregnancy have not been associated with teratogenic effects. Due to increased risk of thromboembolism postpartum, combination hormonal contraceptives should not be started earlier than 4-6 weeks following delivery. Hormonal contraceptives may be less effective in obese patients. An increase in oral contraceptive failure was noted in women with a BMI >27.3. Similar findings were noted in patients weighing ≥90 kg (198 lb) using the contraceptive patch.

LactationEnters breast milk/not recommended (AAP rates “compatible”)

Breast-Feeding ConsiderationsJaundice and breast enlargement in the nursing infant have been reported following the use of combination hormonal contraceptives. May decrease the quality and quantity of breast milk; a nonhormonal form of contraception is recommended.

Adverse ReactionsThe following reactions have been associated with oral contraceptive use:

Increased risk or evidence of association with use:

Cardiovascular: Arterial thromboembolism, cerebral hemorrhage, cerebral thrombosis, hypertension, mesenteric thrombosis, MI, venous thrombosis (with or without embolism)

Gastrointestinal: Gallbladder disease

Hepatic: Hepatic adenomas, liver tumors (benign)

Local: Thrombophlebitis

Ocular: Retinal thrombosis

Respiratory: Pulmonary embolism

Adverse reactions considered drug related:

Cardiovascular: Edema, varicose vein aggravation

Central nervous system: Depression, migraine, mood changes

Dermatologic: Chloasma, melasma, rash (allergic)

Endocrine & metabolic: Amenorrhea, breakthrough bleeding, breast changes (enlargement, pain, secretion, tenderness), fluid retention, infertility (temporary), lactation decreased (with use immediately postpartum), menstrual flow changes, spotting

Gastrointestinal: Abdominal bloating, abdominal cramps, abdominal pain, appetite changes, nausea, weight changes, vomiting

Genitourinary: Cervical ectropion, cervical secretion, vaginal candidiasis, vaginitis

Hematologic: Folate decreased, porphyria exacerbation

Hepatic: Cholestatic jaundice

Neuromuscular & skeletal: Chorea exacerbation

Ocular: Contact lens intolerance, corneal curvature changes (steepening)

Miscellaneous: Anaphylactic/anaphylactoid reactions (including angioedema, circulatory collapse, respiratory collapse, urticaria), SLE exacerbation

Adverse reactions in which association is not confirmed or denied: Acne, Budd-Chiari syndrome, cataracts, colitis, cystitis-like syndrome, dizziness, dysmenorrhea, erythema multiforme, erythema nodosum, headache, hemolytic uremic syndrome, hemorrhagic eruption, hirsutism, libido changes, nervousness, optic neuritis (with or without partial or complete loss of vision), pancreatitis, premenstrual syndrome, renal function impaired, scalp hair loss

Metabolism/Transport Effects

Ethinyl estradiol: **Substrate** of CYP2C9 (minor), 3A4 (major), 3A5-7 (minor); **Inhibits** CYP1A2 (weak), 2B6 (weak), 2C8 (weak), 2C19 (weak), 3A4 (weak)

Desogestrel: **Substrate** of CYP2C19 (major)

Drug Interactions

Acitretin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk X: Avoid combination*

Aminoglutethimide: May increase the metabolism of Progestins. *Risk D: Consider therapy modification*

Aprepitant: May decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Aprepitant: May decrease the serum concentration of Contraceptive (Progestins). *Risk D: Consider therapy modification*

Armodafinil: May decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Barbiturates: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Barbiturates: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Benzodiazepines (metabolized by oxidation): Oral Contraceptive (Estrogens) may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Benzodiazepines (metabolized by oxidation): Oral Contraceptive (Progestins) may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

CarBAMazepine: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

CarBAMazepine: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Colesevelam: May decrease the serum concentration of Ethinyl Estradiol. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Estrogen Derivatives may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CYP2C19 Inducers (Strong): May increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Felbamate: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Felbamate: May decrease the serum concentration of Oral Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Fosaprepitant: May decrease the serum concentration of Oral Contraceptive (Estrogens). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Fosaprepitant: May decrease the serum concentration of Contraceptive (Progestins). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Griseofulvin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk X: Avoid combination*

Griseofulvin: May increase the metabolism of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Herbs (Estrogenic Properties): May enhance the adverse/toxic effect of Estrogen Derivatives. *Risk C: Monitor therapy*

Herbs (Progestogenic Properties) (eg, Bloodroot, Yucca): May enhance the adverse/toxic effect of Progestins. *Risk C: Monitor therapy*

LamoTRIgine: Oral Contraceptive (Estrogens) may decrease the serum concentration of LamoTRIgine. *Risk D: Consider therapy modification*

Modafinil: May decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Mycophenolate: May decrease the serum concentration of Oral Contraceptive (Estrogens). Average AUC values were unchanged, but there was evidence of substantial patient-to-patient variability in response to this combination. *Risk D: Consider therapy modification*

Mycophenolate: May decrease the serum concentration of Oral Contraceptive (Progestins). *Risk D: Consider therapy modification*

Nafcillin: May increase the metabolism of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

OXcarbazepine: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

OXcarbazepine: May decrease the serum concentration of Oral Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Phenytoin: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Phenytoin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Protease Inhibitors: Oral Contraceptive (Estrogens) may diminish the therapeutic effect of Protease Inhibitors. Protease Inhibitors may decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Retinoic Acid Derivatives: May diminish the therapeutic effect of Oral Contraceptive (Progestins). Two forms of contraception are recommended in females of child-bearing potential during retinoic acid derivative therapy. **Exceptions:** Adapalene; Alitretinoin; Tretinoin (Topical). *Risk C: Monitor therapy*

Retinoic Acid Derivatives: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Two forms of contraception are recommended in females of child-bearing potential during retinoic acid derivative therapy. **Exceptions:** Adapalene; Alitretinoin; Tretinoin (Topical). *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Rifamycin Derivatives: May decrease the serum concentration of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Ropinirole: Estrogen Derivatives may increase the serum concentration of Ropinirole. *Risk C: Monitor therapy*

Rufinamide: May decrease the serum concentration of Ethinyl Estradiol. *Risk D: Consider therapy modification*

Selegiline: Oral Contraceptive (Estrogens) may increase the serum concentration of Selegiline. *Risk D: Consider therapy modification*

Selegiline: Oral Contraceptive (Progestins) may increase the serum concentration of Selegiline. *Risk D: Consider therapy modification*

St Johns Wort: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy*

modification

St Johns Wort: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Thyroid Products: Estrogen Derivatives may diminish the therapeutic effect of Thyroid Products. *Risk C: Monitor therapy*

Tipranavir: Estrogen Derivatives may enhance the dermatologic adverse effect of Tipranavir. The combination of tipranavir/ritonavir and ethinyl estradiol/norethindrone was associated with a high incidence of skin rash. Tipranavir may decrease the serum concentration of Estrogen Derivatives. *Risk D: Consider therapy modification*

TiZANidine: Oral Contraceptive (Estrogens) may increase the serum concentration of TiZANidine. *Risk C: Monitor therapy*

Topiramate: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Oral Contraceptive (Estrogens) may diminish the anticoagulant effect of Vitamin K Antagonists. In contrast, enhanced anticoagulant effects have also been noted with some products. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Contraceptive (Progestins) may diminish the anticoagulant effect of Vitamin K Antagonists. In contrast, enhanced anticoagulant effects have also been noted with some products. *Risk D: Consider therapy modification*

Voriconazole: May decrease the metabolism of Oral Contraceptive (Estrogens). Oral Contraceptive (Estrogens) may increase the serum concentration of Voriconazole. *Risk C: Monitor therapy*

Voriconazole: May decrease the metabolism of Oral Contraceptive (Progestins). Oral Contraceptive (Progestins) may increase the serum concentration of Voriconazole. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: CNS effects of caffeine may be enhanced if combination hormonal contraceptives are used concurrently with caffeine. Grapefruit juice increases ethinyl estradiol concentrations and would be expected to increase progesterone serum levels as well; clinical implications are unclear.

Herb/Nutraceutical: St John's wort may decrease levels. Herbs with estrogenic properties may enhance the adverse/toxic effect of estrogen derivatives; examples include alfalfa, black cohosh, bloodroot, hops, kudzu, licorice, red clover, saw palmetto, soybean, thyme, wild yam, yucca. Herbs with progestogenic properties may enhance the adverse/toxic effect of progestins; examples include bloodroot, chasteberry, damiana, oregano, yucca.

Monitoring ParametersBefore starting therapy, a physical exam with reference to the breasts and pelvis are recommended, including a Papanicolaou smear. Exam may be deferred if appropriate; pregnancy should be ruled out prior to use. Monitor patient closely for loss of vision, sudden onset of proptosis, diplopia, migraine; blood pressure; signs and symptoms of thromboembolic disorders; signs or symptoms of depression; glycemic control in patients with diabetes; lipid profiles in patients being treated for hyperlipidemias. Adequate diagnostic measures, including endometrial sampling, if indicated, should be performed to rule out malignancy in all cases of undiagnosed abnormal vaginal bleeding.

Nursing: Physical Assessment/MonitoringMonitor blood pressure on a regular basis. Assess for adverse reactions and potential drug interactions. Assess knowledge/teach importance of regular (monthly) blood pressure checks and annual physical assessment, Pap smear, and vision assessment. Teach importance of maintaining prescribed schedule of dosing. **Pregnancy risk factor X:** Do not use if patient is pregnant.

Patient EducationOral contraceptives do not protect against HIV infection or other sexually-transmitted diseases. Take exactly as directed by prescriber (see package insert). You are at risk of becoming pregnant if doses are missed. Detailed and complete information on dosing and missed doses can be found in the package insert. Be aware that some medications may reduce the effectiveness of oral contraceptives; an alternate form of contraception may be needed. Check all medicines (prescription and over-the-counter), herbal and alternative products with prescriber. It is important that you check your blood pressure monthly (same day each month) and that you have an annual physical assessment, Pap smear, and vision exam while taking this medication. Avoid smoking while taking this medication; smoking increases risk of adverse effects, including thromboembolic events and heart attacks. You may experience loss of appetite (small frequent meals will help); or constipation (increased exercise, fluids, fruit, fiber, or stool softeners may help). If you have diabetes, use accurate serum glucose testing to identify any changes in glucose tolerance; notify prescriber of significant changes so antidiabetic medication can be adjusted if necessary. Report immediately pain or muscle soreness; warmth, swelling, pain, or redness in calves; shortness of breath; sudden loss of vision; unresolved leg/foot swelling; change in menstrual pattern (unusual bleeding, amenorrhea, breakthrough spotting); breast tenderness that does not go away; acute abdominal cramping; signs of vaginal infection (drainage, pain, itching); CNS changes (blurred vision, confusion, acute anxiety, or unresolved depression); chest pain; severe headache or vomiting; weakness in arm or leg; severe abdominal pain or tenderness; jaundice; or significant weight gain (>5 lb/week). Notify prescriber of changes in contact lens tolerance. **Pregnancy/breast-feeding precautions:** This medication should not be used during pregnancy. If you suspect you may become pregnant, contact prescriber immediately.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, low-dose formulations:

Kariva™:

Day 1-21: Ethinyl estradiol 0.02 mg and desogestrel 0.15 mg [21 white tablets]

Day 22-23: 2 inactive light green tablets

Day 24-28: Ethinyl estradiol 0.01 mg [5 light blue tablets] (28s)

Mircette®:

Day 1-21: Ethinyl estradiol 0.02 mg and desogestrel 0.15 mg [21 white tablets]

Day 22-23: 2 inactive green tablets

Day 24-28: Ethinyl estradiol 0.01 mg [5 yellow tablets] (28s)

Tablet, monophasic formulations:

Apri® 28: Ethinyl estradiol 0.03 mg and desogestrel 0.15 mg (28s) [21 rose tablets and 7 white inactive tablets]

Desogen®, Reclipsen™, Solia™: Ethinyl estradiol 0.03 mg and desogestrel 0.15 mg (28s) [21 white tablets and 7 green inactive tablets]

Ortho-Cept® 28: Ethinyl estradiol 0.03 mg and desogestrel 0.15 mg (28s) [21 orange tablets and 7 green inactive tablets]

Tablet, triphasic formulations:

Cesia™, Cyclessa®:

Day 1-7: Ethinyl estradiol 0.025 mg and desogestrel 0.1 mg [7 light yellow tablets]

Day 8-14: Ethinyl estradiol 0.025 mg and desogestrel 0.125 mg [7 orange tablets]

Day 14-21: Ethinyl estradiol 0.025 mg and desogestrel 0.15 mg [7 red tablets]

Day 21-28: 7 green inactive tablets (28s)

Velivet™:

Day 1-7: Ethinyl estradiol 0.025 mg and desogestrel 0.1 mg [7 beige tablets]

Day 8-14: Ethinyl estradiol 0.025 mg and desogestrel 0.125 mg [7 orange tablets]

Day 14-21: Ethinyl estradiol 0.025 mg and desogestrel 0.15 mg [7 pink tablets]

Day 21-28: 7 white inactive tablets (28s)

Mechanism of ActionCombination hormonal contraceptives inhibit ovulation via a negative feedback mechanism on the hypothalamus, which alters the normal pattern of gonadotropin secretion of a follicle-stimulating hormone (FSH) and luteinizing hormone by the anterior pituitary. The follicular phase FSH and midcycle surge of gonadotropins are inhibited. In addition, combination hormonal contraceptives produce alterations in the genital tract, including changes in the cervical mucus, rendering it unfavorable for sperm penetration even if ovulation occurs. Changes in the endometrium may also occur, producing an unfavorable environment for nidation. Combination hormonal contraceptive drugs may alter the tubal transport of the ova through the fallopian tubes. Progestational agents may also alter sperm fertility.

Pharmacodynamics/Kinetics

Absorption: Desogestrel and ethinyl estradiol: Rapid and complete

Protein binding: Etonogestrel (active metabolite): 98%, primarily to sex hormone-binding globulin; Ethinyl estradiol: primarily bound to albumin

Metabolism:

Desogestrel: Hepatic via CYP2C9 to active metabolite etonogestrel (3-keto-desogestrel); etonogestrel metabolized via CYP3A4

Ethinyl estradiol: Hepatic; forms metabolites

Half-life elimination: Etonogestrel: ~38 hours; Ethinyl estradiol: ~26 hours

Excretion: Etonogestrel and ethinyl estradiol: Urine and feces (as metabolites)

Pharmacotherapy PearlsThe World Health Organization (WHO) has issued revised management recommendations for missed combined oral contraceptive pills. Refer to the following reference for a complete presentation and discussion of the guidelines:

> Faculty of Family Planning and Reproductive Health Care Clinical Effectiveness Unit, "Faculty Statement from the CEU on a New Publication: WHO Selected Practice Recommendations for Contraceptive Use Update. Missed Pills: New Recommendations," *J Fam Plann Reprod Health Care*, 2005, 31(2):153-5.

Dental Health: Effects on Dental TreatmentWhen prescribing antibiotics, patient must be warned to use additional methods of birth control if on oral contraceptives.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, headache, depression, insomnia, nervousness, irritability, and mood disturbances

Mental Health: Effects on Psychiatric TreatmentBarbiturates decrease the effects of oral contraceptives; may increase the toxicity of the benzodiazepines and TCAs. The Women's Health Initiative (WHI) Memory Study reported an increased risk of developing dementia in postmenopausal women ≥65 years of age during 4 years of treatment with oral conjugated equine estrogens and medroxyprogesterone acetate relative to placebo (1.8% vs 0.9%). Relative risk was 2.05 (95% CI 1.21-3.48). Therefore, estrogens and progestins should not be used for the prevention of dementia. The WHI also reported an increased risk of stroke (29 vs 21 per 10,000 women-years) compared to women receiving placebo. The increase in risk was observed after the first year and persisted. May cause hypertriglyceridemia; monitor in patients receiving antipsychotics especially clozapine, olanzapine, and quetiapine.

Cardiovascular ConsiderationsIt is important to recognize that hormone-based contraceptives may induce or worsen hypertension. These problems are less severe with low-dose ones. Furthermore, hormone-based contraceptives may precipitate thromboembolic events, particularly in women who smoke. It is important that patients on these contraceptives long-term undergo monitoring of blood pressure and avoid cigarette use.

Index TermsDesogestrel and Ethinyl Estradiol; Ortho Cept

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(ETH in il es tra DYE ole & droh SPYE re none)

U.S. Brand NamesOcella™; Yasmin®; Yaz®

Canadian Brand NamesYasmin®

Pharmacologic CategoryContraceptive; Estrogen and Progestin Combination

Use: Labeled IndicationsFemales: Prevention of pregnancy; treatment of premenstrual dysphoric disorder (PMDD); treatment of acne

Use: Unlabeled/InvestigationalTreatment of hypermenorrhea (menorrhagia); pain associated with endometriosis; dysmenorrhea; dysfunctional uterine bleeding

Dosing: Adults

Acne (Yaz®): Females: Oral: Refer to dosing for contraception.

Contraception (Yasmin®, Yaz®), PMDD (Yaz®): Female: Oral: Dosage is 1 tablet daily for 28 consecutive days. Dose should be taken at the same time each day, either after the evening meal or at bedtime. Dosing may be started on the first day of menstrual period (Day 1 starter) or on the first Sunday after the onset of the menstrual period (Sunday starter).

Day 1 starter: Dose starts on first day of menstrual cycle taking 1 tablet daily.

Sunday starter: Dose begins on first Sunday after onset of menstruation; if the menstrual period starts on Sunday, take first tablet that very same day. **With a Sunday start, an additional method of contraception should be used until after the first 7 days of consecutive administration.**

If all doses have been taken on schedule and one menstrual period is missed, continue dosing cycle. If two consecutive menstrual periods are missed, pregnancy test is required before new dosing cycle is started.

If doses have been missed during the first 3 weeks and the menstrual period is missed, pregnancy should be ruled out prior to continuing treatment.

Missed doses (monophasic formulations) (refer to package insert for complete information):

One dose missed: Take as soon as remembered or take 2 tablets next day

Two consecutive doses missed in the first 2 weeks: Take 2 tablets as soon as remembered or 2 tablets next 2 days. **An additional method of contraception should be used for 7 days after missed dose.**

Two consecutive doses missed in week 3 or three consecutive doses missed at any time: **An additional method of contraception must be used for 7 days after a missed dose.**

Day 1 starter: Current pack should be discarded, and a new pack should be started that same day.

Sunday starter: Continue dose of 1 tablet daily until Sunday, then discard the rest of the pack, and a new pack should be started that same day.

Any number of doses missed in week 4: Continue taking one pill each day until pack is empty; no back-up method of contraception is needed

Dosing: Pediatric

Acne (Yaz®): Females: Children ≥14 years: Oral: Refer to adult dosing.

Contraception (Yasmin®, Yaz®), PMDD (Yaz®): Females: Oral: Refer to adult dosing; not to be used prior to menarche.

Dosing: Renal ImpairmentContraindicated in patients with renal dysfunction (Cl_{cr} ≤50 mL/minute).

Dosing: Hepatic ImpairmentContraindicated in patients with hepatic dysfunction.

Calculations

- Creatinine Clearance: Adults

Administration: OralTo be taken at the same time each day, either after the evening meal or at bedtime

StorageStore at 25°C (77°F).

ContraindicationsHypersensitivity to ethinyl estradiol, drospirenone, or to any component of the formulation; history of or current thrombophlebitis or venous thromboembolic disorders (including DVT, PE); active or recent (within 1 year) arterial thromboembolic disease (eg, stroke, MI); cerebral vascular disease, coronary artery disease, severe hypertension, valvular heart disease with thrombogenic complications; diabetes with vascular involvement; headache with focal neurological symptoms; known or suspected breast carcinoma, endometrial cancer, estrogen-dependent neoplasms, undiagnosed abnormal genital bleeding; renal insufficiency, hepatic dysfunction or tumor, adrenal insufficiency, cholestatic jaundice of pregnancy, jaundice with prior oral contraceptive use; major surgery with prolonged immobilization; heavy smoking (≥15 cigarettes/day) in patients >35 years of age; pregnancy

Allergy Considerations

- Estrogen Allergy

Warnings/Precautions

Boxed warnings:

- Smokers: See “Special populations” below.

Concerns related to adverse effects:

- Breast cancer: The use of combination hormonal contraceptives has been associated with a slight increase in frequency of breast cancer, however, studies are not consistent.
- Glucose intolerance: Combination hormonal contraceptives may cause glucose intolerance.
- Hyperkalemia: Drospirenone has antimineralocorticoid activity that may lead to hyperkalemia in patients with renal insufficiency, hepatic dysfunction, or adrenal insufficiency; use caution with medications that may increase serum potassium.
- Lipid effects: Combination hormonal contraceptives may effect serum triglyceride and lipoprotein levels. Estrogen compounds are generally associated with lipid effects such as increased HDL-cholesterol and decreased LDL-cholesterol. Triglycerides may also be increased; use with caution in patients with familial defects of lipoprotein metabolism.
- Retinal vascular thrombosis: Estrogens may cause retinal vascular thrombosis (has been reported rarely with combination hormonal contraceptives); discontinue permanently if papilledema or retinal vascular lesions are observed on examination.
- Thromboembolism: May increase the risk of thromboembolism.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with risk factors for coronary artery disease; may lead to increased risk of myocardial infarction. May have a dose-related risk of vascular disease and hypertension; women with hypertension should be encouraged to use another form of contraception.
- Depression: Use with caution in patients with depression.
- Diseases exacerbated by fluid retention: Use with caution in patients with diseases which may be exacerbated by fluid retention, including asthma, epilepsy, migraine, diabetes or renal dysfunction.
- Gallbladder disease: May have a dose-related risk of gallbladder disease.
- Migraine: Use with caution in patients with a history of migraine.

Special populations:

- Pediatrics: Not for use prior to menarche.
- Smokers: **[U.S. Boxed Warning]: The risk of cardiovascular side effects increases in women who smoke cigarettes, especially those who are >35 years of age; women who use combination hormonal contraceptives should be strongly advised not to smoke.**
- Surgical patients: Whenever possible, should be discontinued at least 4 weeks prior to and for 2 weeks following elective surgery associated with an increased risk of thromboembolism or during periods of prolonged immobilization.

Other warnings/precautions:

- Acne use: For use only in females ≥14 years of age who have reached menarche, who also desire combination hormonal contraceptive therapy, are unresponsive to topical acne treatments, and have no contraindications to combination hormonal contraceptive use.
- HIV infection protection: Oral contraceptives do not protect against HIV infection or other sexually-transmitted diseases.
- Minimum effective dosage: The minimum dosage combination of estrogen/progestin that will effectively treat the individual patient should be used.
- PMDD use: For use only in females who desire combination hormonal contraceptive therapy; use for more than 3 menstrual cycles has not been evaluated. Has not been evaluated for the treatment of premenstrual syndrome.

Pregnancy Risk FactorX

Pregnancy ConsiderationsIn general, the use of oral contraceptives when inadvertently taken early in pregnancy have not been associated with teratogenic effects. Esophageal atresia was reported in one infant with a single-cycle exposure to ethinyl estradiol and drospirenone *in utero* (association not known). Pregnancy should be ruled out prior to treatment and discontinued if pregnancy occurs. Due to increased risk of thromboembolism postpartum, do not start oral contraceptives earlier than 4-6 weeks following delivery. Hormonal contraceptives may be less effective in obese patients. An increase in oral contraceptive failure was noted in women with a BMI >27.3. Similar findings were noted in patients weighing ≥90 kg (198 lb) using the contraceptive patch.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsThe amount of drospirenone excreted in breast milk is ~0.02%, resulting in a maximum of ~3 mcg/day drospirenone to the infant. Jaundice and breast enlargement in the nursing infant have been reported following the use of other oral contraceptives. In addition, may decrease the quality and quantity of breast milk. Other forms of contraception are recommended while breast-feeding.

Adverse Reactions

>1%:

Central nervous system: Depression, dizziness, emotional lability, fever, headache, migraine, nervousness, pain

Dermatologic: Acne, pruritus, rash

Endocrine & metabolic: Amenorrhea, breast pain, dysmenorrhea, hyperlipidemia, intermenstrual bleeding, libido decreased, menstrual irregularities

Gastrointestinal: Abdomen enlarged, abdominal pain, diarrhea, dyspepsia, gastroenteritis, nausea, tooth disorder, vomiting, weight gain

Genitourinary: Cystitis, leukorrhea, papanicolaou smear suspicious, pelvic pain, UTI, vaginal moniliasis, vaginitis

Neuromuscular & skeletal: Back pain, extremity pain, weakness

Respiratory: Bronchitis, cough, pharyngitis, rhinitis, sinusitis, upper respiratory infection

Miscellaneous: Allergic reaction, flu-like syndrome, infection

Adverse reactions reported with other oral contraceptives: Appetite changes, antithrombin III decreased, arterial thromboembolism, benign liver tumors, breast changes, Budd-Chiari syndrome, carbohydrate intolerance, cataracts, cerebral hemorrhage, cerebral thrombosis, cervical changes, change in corneal curvature (steepening), cholestatic jaundice, colitis, contact lens intolerance, decreased lactation (postpartum), deep vein thrombosis, diplopia, edema, erythema multiforme, erythema nodosum; factors VII, VIII, IX, X increased; folate serum concentrations decreased, gallbladder disease, glucose intolerance, hemolytic uremic syndrome, hemorrhagic eruption, hepatic adenomas, hirsutism, hypercalcemia, hyperglycemia, hypertension, melasma, mesenteric thrombosis, MI, papilledema, platelet aggregability increased, porphyria, premenstrual syndrome, proptosis, prothrombin increased, pulmonary thromboembolism, renal function impairment, retinal thrombosis, sex hormone-binding globulin increased, thrombophlebitis, thyroid-binding globulin increased, total thyroid hormone (T_4) increased, triglycerides/phospholipids increased, vaginal candidiasis

Metabolism/Transport Effects

Ethinyl estradiol: **Substrate** of CYP2C9 (minor), 3A4 (major), 3A5-7 (minor); **Inhibits** CYP1A2 (weak), 2B6 (weak), 2C8 (weak), 2C19 (weak), 3A4 (weak)

Drospirenone: **Substrate** of CYP3A4 (minor); **Inhibits** CYP1A2 (weak), 2C9 (weak), 2C19 (weak), 3A4 (weak)

Drug Interactions

ACE Inhibitors: Potassium-Sparing Diuretics may enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Acitretin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk X: Avoid combination*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Aminoglutethimide: May increase the metabolism of Progestins. *Risk D: Consider therapy modification*

Ammonium Chloride: Potassium-Sparing Diuretics may enhance the adverse/toxic effect of Ammonium Chloride. Specifically the risk of systemic acidosis. *Risk D: Consider therapy modification*

Angiotensin II Receptor Blockers: May enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk C: Monitor therapy*

Aprepitant: May decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Aprepitant: May decrease the serum concentration of Contraceptive (Progestins). *Risk D: Consider therapy modification*

Armodafinil: May decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Barbiturates: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Barbiturates: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Benzodiazepines (metabolized by oxidation): Oral Contraceptive (Estrogens) may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Benzodiazepines (metabolized by oxidation): Oral Contraceptive (Progestins) may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

CarBAMazepine: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

CarBAMazepine: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Cardiac Glycosides: Potassium-Sparing Diuretics may diminish the therapeutic effect of Cardiac Glycosides. Specifically, the inotropic effects. *Risk C: Monitor therapy*

Colesevelam: May decrease the serum concentration of Ethinyl Estradiol. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Estrogen Derivatives may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Eplerenone: May enhance the hyperkalemic effect of Potassium-Sparing Diuretics. Management: This combination is contraindicated in patients receiving eplerenone for treatment of hypertension. *Risk D: Consider therapy modification*

Felbamate: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Felbamate: May decrease the serum concentration of Oral Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Fosaprepitant: May decrease the serum concentration of Oral Contraceptive (Estrogens). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Fosaprepitant: May decrease the serum concentration of Contraceptive (Progestins). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Griseofulvin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk X: Avoid combination*

Griseofulvin: May increase the metabolism of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Herbs (Estrogenic Properties): May enhance the adverse/toxic effect of Estrogen Derivatives. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Progestogenic Properties) (eg, Bloodroot, Yucca): May enhance the adverse/toxic effect of Progestins. *Risk C: Monitor therapy*

LamoTRIgine: Oral Contraceptive (Estrogens) may decrease the serum concentration of LamoTRIgine. *Risk D: Consider therapy modification*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Mitotane: Potassium-Sparing Diuretics may diminish the therapeutic effect of Mitotane. High dose diuretics (eg, Cushings syndrome) may present significantly higher risk than low doses (eg, CHF). *Risk D: Consider therapy modification*

Modafinil: May decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Mycophenolate: May decrease the serum concentration of Oral Contraceptive (Estrogens). Average AUC values were unchanged, but there was evidence of substantial patient-to-patient variability in response to this combination. *Risk D: Consider therapy modification*

Mycophenolate: May decrease the serum concentration of Oral Contraceptive (Progestins). *Risk D: Consider therapy modification*

Nafcillin: May increase the metabolism of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

OXcarbazepine: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

OXcarbazepine: May decrease the serum concentration of Oral Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Phenytoin: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Phenytoin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Potassium Salts: May enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk D: Consider therapy modification*

Potassium-Sparing Diuretics: Drospirenone may enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Protease Inhibitors: Oral Contraceptive (Estrogens) may diminish the therapeutic effect of Protease Inhibitors. Protease Inhibitors may decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

QuiNIDine: Potassium-Sparing Diuretics may diminish the therapeutic effect of QuiNIDine. *Risk C: Monitor therapy*

Retinoic Acid Derivatives: May diminish the therapeutic effect of Oral Contraceptive (Progestins). Two forms of contraception are recommended in females of child-bearing potential during retinoic acid derivative therapy. **Exceptions:** Adapalene; Alitretinoin; Tretinoin (Topical). *Risk C: Monitor therapy*

Retinoic Acid Derivatives: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Two forms of contraception are recommended in females of child-bearing potential during retinoic acid derivative therapy. **Exceptions:** Adapalene; Alitretinoin; Tretinoin (Topical). *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Rifamycin Derivatives: May decrease the serum concentration of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Ropinirole: Estrogen Derivatives may increase the serum concentration of Ropinirole. *Risk C: Monitor therapy*

Rufinamide: May decrease the serum concentration of Ethinyl Estradiol. *Risk D: Consider therapy modification*

Selegiline: Oral Contraceptive (Estrogens) may increase the serum concentration of Selegiline. *Risk D: Consider therapy modification*

Selegiline: Oral Contraceptive (Progestins) may increase the serum concentration of Selegiline. *Risk D: Consider therapy modification*

St Johns Wort: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

St Johns Wort: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Thyroid Products: Estrogen Derivatives may diminish the therapeutic effect of Thyroid Products. *Risk C: Monitor therapy*

Tipranavir: Estrogen Derivatives may enhance the dermatologic adverse effect of Tipranavir. The combination of tipranavir/ritonavir and ethinyl estradiol/norethindrone was associated with a high incidence of skin rash. Tipranavir may decrease the serum concentration of Estrogen Derivatives. *Risk D: Consider therapy modification*

TiZANidine: Oral Contraceptive (Estrogens) may increase the serum concentration of TiZANidine. *Risk C: Monitor therapy*

Topiramate: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Oral Contraceptive (Estrogens) may diminish the anticoagulant effect of Vitamin K Antagonists. In contrast, enhanced anticoagulant effects have also been noted with some products. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Contraceptive (Progestins) may diminish the anticoagulant effect of Vitamin K Antagonists. In contrast, enhanced anticoagulant effects have also been noted with some products. *Risk D: Consider therapy modification*

Voriconazole: May decrease the metabolism of Oral Contraceptive (Estrogens). Oral Contraceptive (Estrogens) may increase the serum concentration of Voriconazole. *Risk C: Monitor therapy*

Voriconazole: May decrease the metabolism of Oral Contraceptive (Progestins). Oral Contraceptive (Progestins) may increase the serum concentration of Voriconazole. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: CNS effects of caffeine may be enhanced if oral contraceptives are used concurrently with caffeine. Grapefruit juice increases ethinyl estradiol concentrations; clinical implications are unclear.

Herb/Nutraceutical: St John's wort may decrease levels. Herbs with estrogenic properties may enhance the adverse/toxic effect of estrogen derivatives; examples include alfalfa, black cohosh, bloodroot, hops, kudzu, licorice, red clover, saw palmetto, soybean, thyme, wild yam, yucca. Herbs with progestogenic properties may enhance the adverse/toxic effect of progestins; examples include bloodroot, chasteberry, damiana, oregano, yucca.

Monitoring ParametersBefore starting therapy, a physical exam with reference to the breasts and pelvis are recommended, including a Papanicolaou smear. Exam may be deferred if appropriate; pregnancy should be ruled out prior to use. Monitor patient closely for loss of vision, sudden onset of proptosis, diplopia, migraine; blood pressure; signs and symptoms of thromboembolic disorders; signs or symptoms of depression; glycemic control in patients with diabetes; lipid profiles in patients being treated for hyperlipidemias; serum potassium in high-risk patients and those on medications with potassium-retaining properties. Adequate diagnostic measures, including endometrial sampling, if indicated, should be performed to rule out malignancy in all cases of undiagnosed abnormal vaginal bleeding.

Nursing: Physical Assessment/MonitoringMonitor or teach patient to monitor blood pressure on a regular (monthly) basis, and the importance of annual physical examinations (including Pap smear and vision exam). Assess knowledge/teach patient the importance of maintaining prescribed schedule of dosing, possible side effects, appropriate interventions, and adverse reactions to report. **Pregnancy risk factor X:** Determine patient is not pregnant prior to prescribing.

Patient EducationTake exactly as directed by prescriber (see package insert). An additional form of contraception should be used until after the first 7 consecutive days of administration. You are at risk of becoming pregnant if doses are missed. If you miss a dose, take as soon as possible or double the dose the next day. If two or more consecutive doses are missed, contact prescriber for restarting directions. Detailed and complete information on dosing and missed doses can be found in the package insert. If any number of doses are missed in week 4, continue taking one pill each day until pack is empty; no back-up method of contraception is needed. Be aware that some medications may reduce the effectiveness of oral contraceptives; an alternate form of contraception may be needed (see Drug Interactions). It is important that you check your blood pressure monthly (on same day each month) and report any increased blood pressure to prescriber. Have an annual physical assessment, Pap smear, and vision exam while taking this medication. Avoid smoking while taking this medication; smoking increases risk of adverse effects, including thromboembolic events and heart attacks. You may experience loss of appetite (small frequent meals will help); or constipation (increased exercise, fluids, fruit, fiber, or stool softeners may help). If you have diabetes, you should use accurate serum glucose testing to identify any changes in glucose tolerance; notify prescriber of significant changes so antidiabetic medication can be adjusted if necessary. Report immediately pain or muscle soreness; warmth, swelling, pain, or redness in calves; shortness of breath; sudden loss of vision; unresolved leg/foot swelling or weight gain (>5 lb); change in menstrual pattern (unusual bleeding, amenorrhea, breakthrough spotting); breast tenderness that does not go away; acute abdominal cramping; signs of vaginal infection (drainage, pain, itching); CNS changes (blurred vision, confusion, acute anxiety, or unresolved depression); chest pain; severe headache or vomiting; severe abdominal pain or tenderness; weakness in arm or leg; jaundice; or other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Ocella™: Ethinyl estradiol 0.03 mg and drospirenone 3 mg (28s) [21 yellow active tablets and 7 white inactive tablets]

Yasmin®: Ethinyl estradiol 0.03 mg and drospirenone 3 mg (28s) [21 yellow active tablets and 7 white inactive tablets]

Yaz®: Ethinyl estradiol 0.02 mg and drospirenone 3 mg (28s) [24 light pink tablets and 4 white inactive tablets]

Generic AvailableNo

ManufacturerBerlex Laboratories, Inc

Tablets (Yasmin 28)

3-0.03 mg (28): $65.99

Tablets (YAZ)

3-0.02 mg (28): $57.99

Mechanism of ActionCombination oral contraceptives inhibit ovulation via a negative feedback mechanism on the hypothalamus, which alters the normal pattern of gonadotropin secretion of a follicle-stimulating hormone (FSH) and luteinizing hormone by the anterior pituitary. The follicular phase FSH and midcycle surge of gonadotropins are inhibited. In addition, oral contraceptives produce alterations in the genital tract, including changes in the cervical mucus, rendering it unfavorable for sperm penetration even if ovulation occurs. Changes in the endometrium may also occur, producing an unfavorable environment for nidation. Oral contraceptive drugs may alter the tubal transport of the ova through the fallopian tubes. Progestational agents may also alter sperm fertility. Drospirenone is a spironolactone analogue with antimineralocorticoid and antiandrogenic activity.

Pharmacodynamics/Kinetics

Distribution: Drospirenone: 4 L/kg; Ethinyl estradiol: 4-5 L/kg

Protein binding: Drospirenone: Serum proteins (excluding sex hormone-binding globulin and corticosteroid-binding globulin): 97%; Ethinyl estradiol: ~98%

Metabolism: Drospirenone: To inactive metabolites, minor metabolism hepatically via CYP3A4; Ethinyl estradiol: Hepatic via CYP3A4; forms metabolites; undergoes enterohepatic circulation

Bioavailability: Drospirenone: 76%; Ethinyl estradiol: 40%

Half-life elimination: Drospirenone: 30 hours; Ethinyl estradiol: ~24 hours

Time to peak: 1-3 hours

Excretion: Drospirenone, ethinyl estradiol: Urine and feces

Pharmacotherapy PearlsThe World Health Organization (WHO) has issued revised management recommendations for missed combined oral contraceptive pills. Refer to the following reference for a complete presentation and discussion of the guidelines:

Faculty of Family Planning and Reproductive Health Care Clinical Effectiveness Unit, "Faculty Statement from the CEU on a New Publication: WHO Selected Practice Recommendations for Contraceptive Use Update. Missed Pills: New Recommendations," *J Fam Plann Reprod Health Care*, 2005, 31(2):153-5.

Dental Health: Effects on Dental TreatmentWhen prescribing antibiotics, patient must be warned to use additional methods of birth control if on oral contraceptives.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, headache, depression, insomnia, nervousness, irritability, and mood disturbances

Mental Health: Effects on Psychiatric TreatmentMay cause flu-like symptoms, take this into consideration if also concerned about SSRI discontinuation syndrome. Carbamazepine and topiramate may increase the metabolism of estradiol, leading to a decrease in serum concentrations. Estrogens may inhibit the metabolism of some benzodiazepines (alprazolam, chlordiazepoxide, diazepam), TCAs, and selegiline. Estrogens may increase the clearance of lorazepam, oxazepam, and temazepam. The Women's Health Initiative (WHI) Memory Study reported an increased risk of developing dementia in postmenopausal women ≥65 years of age during 4 years of treatment with oral conjugated equine estrogens and medroxyprogesterone acetate relative to placebo (1.8% vs 0.9%). Relative risk was 2.05 (95% CI 1.21-3.48). Therefore, estrogens and progestins should not be used for the prevention of dementia. The WHI also reported an increased risk of stroke (29 vs 21 per 10,000 women-years) compared to women receiving placebo. The increase in risk was observed after the first year and persisted. May cause hypertriglyceridemia; monitor in patients receiving antipsychotics especially clozapine, olanzapine, and quetiapine.

Index TermsDrospirenone and Ethinyl Estradiol

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Demulen® may be confused with Dalmane®, Demerol®

Pronunciation(ETH in il es tra DYE ole & e thye noe DYE ole dye AS e tate)

U.S. Brand NamesKelnor™; Zovia®

Canadian Brand NamesDemulen® 30

Pharmacologic Category[Contraceptive](); [Estrogen and Progestin Combination]()

Use: Labeled IndicationsPrevention of pregnancy

Use: Unlabeled/InvestigationalTreatment of hypermenorrhea (menorrhagia); pain associated with endometriosis; dysmenorrhea; dysfunctional uterine bleeding

Dosing: Adults

Females: Contraception: Oral:

- Schedule 1 (Sunday starter): Dose begins on first Sunday after onset of menstruation; if the menstrual period starts on Sunday, take first tablet that very same day. **With a Sunday start, an additional method of contraception should be used until after the first 7 days of consecutive administration:**
  - For 21-tablet package: 1 tablet/day for 21 consecutive days, followed by 7 days off of the medication; a new course begins on the 8th day after the last tablet is taken
  - For 28-tablet package: 1 tablet/day without interruption
- Schedule 2 (Day-1 starter): Dose starts on first day of menstrual cycle taking 1 tablet/day:
  - For 21-tablet package: 1 tablet/day for 21 consecutive days, followed by 7 days off of the medication; a new course begins on the 8th day after the last tablet is taken
  - For 28-tablet package: 1 tablet/day without interruption
- If all doses have been taken on schedule and one menstrual period is missed, continue dosing cycle. If two consecutive menstrual periods are missed, pregnancy test is required before new dosing cycle is started.
- Missed doses **monophasic formulations** (refer to package insert for complete information):
  - One dose missed: Take as soon as remembered or take 2 tablets next day
  - Two consecutive doses missed in the first 2 weeks: Take 2 tablets as soon as remembered or 2 tablets next 2 days. **An additional method of contraception should be used for 7 days after missed dose.**
  - Two consecutive doses missed in week 3 or three consecutive doses missed at any time: **An additional method of contraception must be used for 7 days after a missed dose:**
    - Schedule 1 (Sunday starter): Continue dose of 1 tablet daily until Sunday, then discard the rest of the pack, and a new pack should be started that same day.
    - Schedule 2 (Day-1 starter): Current pack should be discarded, and a new pack should be started that same day.

Dosing: PediatricFemales: Contraception: Oral: Refer to adult dosing; not to be used prior to menarche.

Dosing: Renal ImpairmentSpecific guidelines not available; use with caution and monitor blood pressure closely. Consider other forms of contraception.

Dosing: Hepatic ImpairmentContraindicated in patients with hepatic impairment.

Administration: OralAdminister at the same time each day.

Dietary ConsiderationsShould be taken with food at same time each day.

StorageStore at controlled room temperature of 25°C (77°F).

ContraindicationsHypersensitivity to ethinyl estradiol, ethynodiol diacetate, or any component of the formulation; history of or current thrombophlebitis or venous thromboembolic disorders (including DVT, PE); active or recent (within 1 year) arterial thromboembolic disease (eg, stroke, MI); cerebral vascular disease, coronary artery disease, valvular heart disease with complications, severe hypertension; diabetes mellitus with vascular involvement; severe headache with focal neurological symptoms; known or suspected breast carcinoma, endometrial cancer, estrogen-dependent neoplasms, undiagnosed abnormal genital bleeding; hepatic dysfunction or tumor, cholestatic jaundice of pregnancy, jaundice with prior combination hormonal contraceptive use; major surgery with prolonged immobilization; heavy smoking (≥15 cigarettes/day) in patients >35 years of age; pregnancy

Allergy Considerations

- Estrogen Allergy

Warnings/Precautions

Boxed warnings:

- Smokers: See “Special populations” below.

Concerns related to adverse effects:

- Breast cancer: The use of combination hormonal contraceptives has been associated with a slight increase in frequency of breast cancer, however, studies are not consistent.
- Glucose intolerance: Combination hormonal contraceptives may cause glucose intolerance.
- Lipid effects: Combination hormonal contraceptives may effect serum triglyceride and lipoprotein levels. Estrogen compounds are generally associated with lipid effects such as increased HDL-cholesterol and decreased LDL-cholesterol. Triglycerides may also be increased; use with caution in patients with familial defects of lipoprotein metabolism.
- Retinal vascular thrombosis: Estrogens may cause retinal vascular thrombosis (has been reported rarely with combination hormonal contraceptives); discontinue permanently if papilledema or retinal vascular lesions are observed on examination.
- Thromboembolism: May increase the risk of thromboembolism.

Disease-related adverse effects:

- Cardiovascular disease: Use with caution in patients with risk factors for coronary artery disease; may lead to increased risk of myocardial infarction. May have a dose-related risk of vascular disease and hypertension; women with hypertension should be encouraged to use a nonhormonal form of contraception.
- Depression: Use with caution in patients with depression.
- Diseases exacerbated by fluid retention: Use with caution in patients with diseases which may be exacerbated by fluid retention, including asthma, epilepsy, migraine, diabetes or renal dysfunction.
- Gallbladder disease: May have a dose-related risk of gallbladder disease.
- Migraine: Use with caution in patients with a history of migraine.
- Renal impairment: Women with renal disease should be encouraged to use a nonhormonal form of contraception.

Special populations:

- Pediatrics: Not for use prior to menarche.
- Smokers: **[U.S. Boxed Warning]: The risk of cardiovascular side effects increases in women who smoke cigarettes, especially those who are >35 years of age; women who use combination hormonal contraceptives should be strongly advised not to smoke.**
- Surgical patients: Whenever possible, should be discontinued at least 4 weeks prior to and for 2 weeks following elective surgery associated with an increased risk of thromboembolism or during periods of prolonged immobilization.

Other warnings/precautions:

- HIV infection protection: Oral contraceptives do not protect against HIV infection or other sexually-transmitted diseases.
- Minimum effective dosage: The minimum dosage combination of estrogen/progestin that will effectively treat the individual patient should be used. New patients should be started on products containing ≤0.035 mg of estrogen per tablet.

Pregnancy Risk FactorX

Pregnancy ConsiderationsPregnancy should be ruled out prior to treatment and discontinued if pregnancy occurs. In general, the use of combination hormonal contraceptives when inadvertently taken early in pregnancy have not been associated with teratogenic effects. Due to increased risk of thromboembolism postpartum, combination hormonal contraceptives should not be started earlier than 4-6 weeks following delivery. Hormonal contraceptives may be less effective in obese patients. An increase in oral contraceptive failure was noted in women with a BMI >27.3. Similar findings were noted in patients weighing ≥90 kg (198 lb) using the contraceptive patch.

LactationEnters breast milk/not recommended (AAP rates “compatible”)

Breast-Feeding ConsiderationsJaundice and breast enlargement in the nursing infant have been reported following the use of combination hormonal contraceptives. May decrease the quality and quantity of breast milk; a nonhormonal form of contraception is recommended.

Adverse ReactionsFrequency not defined.

Cardiovascular: Arterial thromboembolism, cerebral hemorrhage, cerebral thrombosis, edema, hypertension, mesenteric thrombosis, MI

Central nervous system: Depression, dizziness, headache, migraine, nervousness, premenstrual syndrome, stroke

Dermatologic: Acne, erythema multiforme, erythema nodosum, hirsutism, loss of scalp hair, melasma (may persist), rash (allergic)

Endocrine & metabolic: Amenorrhea, breakthrough bleeding, breast enlargement, breast secretion, breast tenderness, carbohydrate intolerance, lactation decreased (postpartum), glucose tolerance decreased, libido changes, menstrual flow changes, sex hormone-binding globulins (SHBG) increased, spotting, temporary infertility (following discontinuation), thyroid-binding globulin increased, triglycerides increased

Gastrointestinal: Abdominal cramps, appetite changes, bloating, cholestasis, colitis, gallbladder disease, jaundice, nausea, vomiting, weight gain/loss

Genitourinary: Cervical erosion changes, cervical secretion changes, cystitis-like syndrome, vaginal candidiasis, vaginitis

Hematologic: Antithrombin III decreased, folate levels decreased, hemolytic uremic syndrome, norepinephrine induced platelet aggregability increased, porphyria, prothrombin increased; factors VII, VIII, IX, and X increased

Hepatic: Benign liver tumors, Budd-Chiari syndrome, cholestatic jaundice, hepatic adenomas

Local: Thrombophlebitis

Ocular: Cataracts, change in corneal curvature (steepening), contact lens intolerance, optic neuritis, retinal thrombosis

Renal: Impaired renal function

Respiratory: Pulmonary thromboembolism

Miscellaneous: Hemorrhagic eruption

Metabolism/Transport EffectsEthinyl estradiol: **Substrate** of CYP2C9 (minor), 3A4 (major), 3A5-7 (minor); **Inhibits** CYP1A2 (weak), 2B6 (weak), 2C8 (weak), 2C19 (weak), 3A4 (weak)

Drug Interactions

Acitretin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk X: Avoid combination*

Aminoglutethimide: May increase the metabolism of Progestins. *Risk D: Consider therapy modification*

Aprepitant: May decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Aprepitant: May decrease the serum concentration of Contraceptive (Progestins). *Risk D: Consider therapy modification*

Armodafinil: May decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Barbiturates: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Barbiturates: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Benzodiazepines (metabolized by oxidation): Oral Contraceptive (Estrogens) may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Benzodiazepines (metabolized by oxidation): Oral Contraceptive (Progestins) may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

CarBAMazepine: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

CarBAMazepine: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Colesevelam: May decrease the serum concentration of Ethinyl Estradiol. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Estrogen Derivatives may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Felbamate: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Felbamate: May decrease the serum concentration of Oral Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Fosaprepitant: May decrease the serum concentration of Oral Contraceptive (Estrogens). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Fosaprepitant: May decrease the serum concentration of Contraceptive (Progestins). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Griseofulvin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk X: Avoid combination*

Griseofulvin: May increase the metabolism of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Herbs (Estrogenic Properties): May enhance the adverse/toxic effect of Estrogen Derivatives. *Risk C: Monitor therapy*

Herbs (Progestogenic Properties) (eg, Bloodroot, Yucca): May enhance the adverse/toxic effect of Progestins. *Risk C: Monitor therapy*

LamoTRIgine: Oral Contraceptive (Estrogens) may decrease the serum concentration of LamoTRIgine. *Risk D: Consider therapy modification*

Modafinil: May decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Mycophenolate: May decrease the serum concentration of Oral Contraceptive (Estrogens). Average AUC values were unchanged, but there was evidence of substantial patient-to-patient variability in response to this combination. *Risk D: Consider therapy modification*

Mycophenolate: May decrease the serum concentration of Oral Contraceptive (Progestins). *Risk D: Consider therapy modification*

Nafcillin: May increase the metabolism of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

OXcarbazepine: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

OXcarbazepine: May decrease the serum concentration of Oral Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Phenytoin: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Phenytoin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Protease Inhibitors: Oral Contraceptive (Estrogens) may diminish the therapeutic effect of Protease Inhibitors. Protease Inhibitors may decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Retinoic Acid Derivatives: May diminish the therapeutic effect of Oral Contraceptive (Progestins). Two forms of contraception are recommended in females of child-bearing potential during retinoic acid derivative therapy. **Exceptions:** Adapalene; Alitretinoin; Tretinoin (Topical). *Risk C: Monitor therapy*

Retinoic Acid Derivatives: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Two forms of contraception are recommended in females of child-bearing potential during retinoic acid derivative therapy. **Exceptions:** Adapalene; Alitretinoin; Tretinoin (Topical). *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Rifamycin Derivatives: May decrease the serum concentration of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Ropinirole: Estrogen Derivatives may increase the serum concentration of Ropinirole. *Risk C: Monitor therapy*

Rufinamide: May decrease the serum concentration of Ethinyl Estradiol. *Risk D: Consider therapy modification*

Selegiline: Oral Contraceptive (Estrogens) may increase the serum concentration of Selegiline. *Risk D: Consider therapy modification*

Selegiline: Oral Contraceptive (Progestins) may increase the serum concentration of Selegiline. *Risk D: Consider therapy modification*

St Johns Wort: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

St Johns Wort: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Thyroid Products: Estrogen Derivatives may diminish the therapeutic effect of Thyroid Products. *Risk C: Monitor therapy*

Tipranavir: Estrogen Derivatives may enhance the dermatologic adverse effect of Tipranavir. The combination of tipranavir/ritonavir and ethinyl estradiol/norethindrone was associated with a high incidence of skin rash. Tipranavir may decrease the serum concentration of Estrogen Derivatives. *Risk D: Consider therapy modification*

TiZANidine: Oral Contraceptive (Estrogens) may increase the serum concentration of TiZANidine. *Risk C: Monitor therapy*

Topiramate: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Oral Contraceptive (Estrogens) may diminish the anticoagulant effect of Vitamin K Antagonists. In contrast, enhanced anticoagulant effects have also been noted with some products. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Contraceptive (Progestins) may diminish the anticoagulant effect of Vitamin K Antagonists. In contrast, enhanced anticoagulant effects have also been noted with some products. *Risk D: Consider therapy modification*

Voriconazole: May decrease the metabolism of Oral Contraceptive (Estrogens). Oral Contraceptive (Estrogens) may increase the serum concentration of Voriconazole. *Risk C: Monitor therapy*

Voriconazole: May decrease the metabolism of Oral Contraceptive (Progestins). Oral Contraceptive (Progestins) may increase the serum concentration of Voriconazole. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: CNS effects of caffeine may be enhanced if combination hormonal contraceptives are used concurrently with caffeine. Grapefruit juice increases ethinyl estradiol concentrations and would be expected to increase progesterone serum levels as well; clinical implications are unclear.

Herb/Nutraceutical: St John's wort may decrease levels. Herbs with estrogenic properties may enhance the adverse/toxic effect of estrogen derivatives; examples include alfalfa, black cohosh, bloodroot, hops, kudzu, licorice, red clover, saw palmetto, soybean, thyme, wild yam, yucca. Herbs with progestogenic properties may enhance the adverse/toxic effect of progestins; examples include bloodroot, chasteberry, damiana, oregano, yucca.

Monitoring ParametersBefore starting therapy, a physical exam with reference to the breasts and pelvis are recommended, including a Papanicolaou smear. Exam may be deferred if appropriate; pregnancy should be ruled out prior to use. Monitor patient closely for loss of vision, sudden onset of proptosis, diplopia, migraine; blood pressure; signs and symptoms of thromboembolic disorders; signs or symptoms of depression; glycemic control in patients with diabetes; lipid profiles in patients being treated for hyperlipidemias. Adequate diagnostic measures, including endometrial sampling, if indicated, should be performed to rule out malignancy in all cases of undiagnosed abnormal vaginal bleeding.

Nursing: Physical Assessment/MonitoringMonitor or teach patient to monitor blood pressure on a regular basis. Monitor or teach patient to monitor for occurrence of adverse effects and symptoms to report. Assess knowledge/teach importance of regular (monthly) blood pressure checks and annual physical assessment, Pap smear, and vision assessment. Teach importance of maintaining prescribed schedule of dosing. **Pregnancy risk factor X:** Do not use if patient is pregnant.

Patient EducationOral contraceptives do not protect against HIV or other sexually-transmitted diseases. Take exactly as directed by prescriber (also see package insert). You are at risk of becoming pregnant if doses are missed. Detailed and complete information on dosing and missed doses can be found in the package insert. Be aware that some medications may reduce the effectiveness of oral contraceptives; an alternate form of contraception may be needed. Check all medicines (prescription and OTC), herbal, and alternative products with prescriber. It is important that you check your blood pressure monthly (on same day each month) and that you have an annual physical assessment, Pap smear, and vision assessment while taking this medication. Avoid smoking while taking this medication; smoking increases risk of adverse effects, including thromboembolic events and heart attacks. You may experience loss of appetite (small frequent meals will help); or constipation (increased exercise, fluids, fruit, fiber, or stool softeners may help). If you have diabetes, use accurate serum glucose testing to identify any changes in glucose tolerance; notify prescriber of significant changes so antidiabetic medication can be adjusted if necessary. Report immediately pain or muscle soreness; warmth, swelling, pain, or redness in calves; shortness of breath; sudden loss of vision; unresolved leg/foot swelling; change in menstrual pattern (unusual bleeding, amenorrhea, breakthrough spotting); breast tenderness that does not go away; acute abdominal cramping; signs of vaginal infection (drainage, pain, itching); CNS changes (blurred vision, confusion, acute anxiety, or unresolved depression); chest pain; severe headache or vomiting; weakness in arm or leg; severe abdominal pain or tenderness; jaundice; or significant weight gain (>5 lb/week). Notify prescriber of changes in contact lens tolerance. **Pregnancy/breast-feeding precautions:** This medication should not be used during pregnancy. If you suspect you may become pregnant, contact prescriber immediately. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, monophasic formulations:

Kelnor™ 1/35: Ethinyl estradiol 0.035 mg and ethynodiol diacetate 1 mg [21 light yellow tablets and 7 white inactive tablets] (28s)

Zovia® 1/35-28: Ethinyl estradiol 0.035 mg and ethynodiol diacetate 1 mg [21 light pink tablets and 7 white inactive tablets] (28s)

Zovia® 1/50-28: Ethinyl estradiol 0.05 mg and ethynodiol diacetate 1 mg [21 pink tablets and 7 white inactive tablets] (28s)

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Kelnor 1/35)

1-35 mg-mcg (28): $28.99

Tablets (Zovia 1/35E (28))

1-35 mg-mcg (28): $32.99

Tablets (Zovia 1/50E (28))

1-50 mg-mcg (28): $33.99

Mechanism of ActionCombination hormonal contraceptives inhibit ovulation via a negative feedback mechanism on the hypothalamus, which alters the normal pattern of gonadotropin secretion of a follicle-stimulating hormone (FSH) and luteinizing hormone by the anterior pituitary. The follicular phase FSH and midcycle surge of gonadotropins are inhibited. In addition, combination hormonal contraceptives produce alterations in the genital tract, including changes in the cervical mucus, rendering it unfavorable for sperm penetration even if ovulation occurs. Changes in the endometrium may also occur, producing an unfavorable environment for nidation. Combination hormonal contraceptive drugs may alter the tubal transport of the ova through the fallopian tubes. Progestational agents may also alter sperm fertility.

Pharmacodynamics/Kinetics

Ethynodiol diacetate (converted to norethindrone)

Metabolism: Hepatic conjugation

Half-life elimination: Terminal: 5-14 hours

See Norethindrone monograph.

Pharmacotherapy PearlsThe World Health Organization (WHO) has issued revised management recommendations for missed combined oral contraceptive pills. Refer to the following reference for a complete presentation and discussion of the guidelines:

Faculty of Family Planning and Reproductive Health Care Clinical Effectiveness Unit, "Faculty Statement from the CEU on a New Publication: WHO Selected Practice Recommendations for Contraceptive Use Update. Missed Pills: New Recommendations," *J Fam Plann Reprod Health Care*, 2005, 31(2):153-5.

Dental Health: Effects on Dental TreatmentWhen prescribing antibiotics, patient must be warned to use additional methods of birth control if on oral contraceptives.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental Status May cause dizziness, headache, depression, insomnia, nervousness, irritability, and mood disturbances

Mental Health: Effects on Psychiatric Treatment The Women's Health Initiative (WHI) Memory Study reported an increased risk of developing dementia in postmenopausal women ≥65 years of age during 4 years of treatment with oral conjugated equine estrogens and medroxyprogesterone acetate relative to placebo (1.8% vs 0.9%). Relative risk was 2.05 (95% CI 1.21-3.48). Therefore, estrogens and progestins should not be used for the prevention of dementia. The WHI also reported an increased risk of stroke (29 vs 21 per 10,000 women-years) compared to women receiving placebo. The increase in risk was observed after the first year and persisted. May cause hypertriglyceridemia; monitor in patients receiving antipsychotics especially clozapine, olanzapine, and quetiapine.

Cardiovascular Considerations It is important to recognize that hormone-based contraceptives may induce or worsen hypertension. These problems are less severe with low-dose ones.Furthermore, hormone-based contraceptives may precipitate thromboembolic events, particularly in women who smoke. It is important that patients on these contraceptives long-term undergo monitoring of blood pressure and avoid cigarette use.

Index Terms Ethynodiol Diacetate and Ethinyl Estradiol

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(ETH in il es tra DYE ole & et oh noe JES trel)

U.S. Brand NamesNuvaRing®

Canadian Brand NamesNuvaRing®

Pharmacologic CategoryContraceptive; Estrogen and Progestin Combination

Use: Labeled IndicationsPrevention of pregnancy

Use: Unlabeled/InvestigationalTreatment of hypermenorrhea (menorrhagia); pain associated with endometriosis; dysmenorrhea; dysfunctional uterine bleeding

Dosing: AdultsFemales: Contraception: Vaginal: One ring, inserted vaginally and left in place for 3 consecutive weeks, then removed for 1 week. A new ring is inserted 7 days after the last was removed (even if bleeding is not complete) and should be inserted at approximately the same time of day the ring was removed the previous week.

Initial treatment should begin as follows (pregnancy should always be ruled out first):

No hormonal contraceptive use in the past month: Insert ring on the first day of menstrual cycle (“Day 1”). May also insert on days 2-5 even if bleeding is not complete, however, **a spermicide or barrier method of contraception should be used for the following 7 days.***

Switching from combination oral contraceptive: Ring can be inserted on any day within 7 days after the last **active** tablet in the cycle was taken and no later than the first day a new cycle of tablets would begin. Additional forms of contraception are not needed.

Switching from progestin-only contraceptive: **A spermicide or barrier method of contraception should be used for the following 7 days with any of the following.***

If previously using a progestin-only mini-pill, insert the ring on any day of the month; do not skip days between the last pill and insertion of the ring.

If previously using an implant, insert the ring on the same day of implant removal.

If previously using a progestin-containing IUD, insert the ring on day of IUD removal.

If previously using a progestin injection, insert the ring on the day the next injection would be given.

Following complete 1st trimester abortion: Insert ring within the first 5 days of abortion. If not inserted within 5 days, follow instructions for “No hormonal contraceptive use within the past month” and instruct patient to use a nonhormonal contraceptive in the interim.

Following delivery or 2nd trimester abortion: Insert ring 4 weeks postpartum (in women who are not breast-feeding) or following 2nd trimester abortion. **A spermicide or barrier method of contraception should be used for the following 7 days.***

If the ring is accidentally removed from the vagina at anytime during the 3-week period of use, it may be rinsed with cool or lukewarm water (not hot) and reinserted as soon as possible. If the ring is not reinserted within 3 hours, contraceptive effectiveness will be decreased. **A spermicide or barrier method of contraception should be used until the ring has been in place for 7 consecutive days.***

If the ring has been removed for longer than 1 week, pregnancy must be ruled out prior to restarting therapy. **A spermicide or barrier method of contraception should be used for the following 7 days.***

If the ring has been left in place for >3 weeks, a new ring should be inserted following a 1-week (ring-free) interval. Protection continues during week 4, however, if the ring is left in place >4 weeks, pregnancy must be ruled out prior to insertion and **a spermicide or barrier method of contraception should be used for the following 7 days.***

Disconnected ring: In the event the ring disconnects at the weld joint, discard and replace with a new ring.

***Note:** Diaphragms may interfere with proper ring placement, and therefore, are not recommended for use as an additional form of contraception.

Dosing: PediatricFemales: Contraception: Vaginal: Refer to adult dosing; not to be used prior to menarche.

Dosing: Renal ImpairmentSpecific guidelines not available; use with caution and monitor blood pressure closely. Consider other forms of contraception.

Dosing: Hepatic ImpairmentContraindicated in patients with hepatic impairment

Administration: OtherVaginal: Wash hands and remove ring from protective pouch (keep pouch for later ring disposal). Press sides of ring together between thumb and index finger and insert folded ring into vagina. Specific placement is not required for ring to be effective, but ring should be inserted far enough into the vagina as to be comfortable. To remove, hook index finger around rim and pull out. Vaginal ring **cannot** be disposed of in the toilet. New rings should be inserted at approximately the same time of day the ring was removed the previous week. If the ring accidentally falls out, it may be rinsed with cool or warm (not hot) water and replaced. However, it must be replaced within 3 hours. Refer to dosing if ring is out of place for >3 hours. Tampons do not interfere with the effectiveness of the ring; caution should be used when removing tampon not to remove ring. The ring may interfere with correct placement of diaphragms; diaphragms should not be used as a back-up method of contraception. Ensure proper vaginal placement of the ring to avoid inadvertent urinary bladder insertion.

Storage Prior to dispensing, store under refrigeration, 2°C to 8°C (36°F to 46°F). After dispensing, may be stored at room temperature of 25°C (77°F) for up to 4 months. Avoid direct sunlight or temperatures >30˚C (86˚F).

Contraindications Hypersensitivity to ethinyl estradiol, etonogestrel, or any component of the formulation; history of or current thrombophlebitis or venous thromboembolic disorders (including DVT, PE); active or recent (within 1 year) arterial thromboembolic disease (eg, stroke, MI); major surgery with prolonged immobilization, cerebral vascular disease, coronary artery disease, valvular heart disease with complications, severe hypertension; diabetes mellitus with vascular involvement; severe headache with focal neurological symptoms; known or suspected breast carcinoma or personal history of breast cancer, endometrial cancer, estrogen-dependent neoplasms, undiagnosed abnormal genital bleeding; active liver disease or tumor, cholestatic jaundice of pregnancy, jaundice with prior combination hormonal contraceptive use; heavy smoking (≥15 cigarettes/day) in patients >35 years of age; pregnancy

Allergy Considerations

- Estrogen Allergy

Warnings/Precautions

Boxed warnings:

- Smokers: See "Special populations" below.

Concerns related to adverse effects:

- Breast cancer: The use of combination hormonal contraceptives has been associated with a slight increase in frequency of breast cancer, however, studies are not consistent.
- Carbohydrate intolerance: May have adverse effects on glucose tolerance; use caution in women with diabetes.

Disease-related concerns:

- Lipid effects: Combination hormonal contraceptives may effect serum triglyceride and lipoprotein levels. Estrogen compounds are generally associated with lipid effects such as increased HDL-cholesterol and decreased LDL-cholesterol. Triglycerides may also be increased; use with caution in patients with familial defects of lipoprotein metabolism.
- Retinal vascular thrombosis: Estrogens may cause retinal vascular thrombosis (has been reported rarely with combination hormonal contraceptives); discontinue permanently if loss of vision occurs, or if papilledema or retinal vascular lesions are observed on examination.
- Thromboembolism: May increase the risk of thromboembolism.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with risk factors for coronary artery disease; may lead to increased risk of myocardial infarction. May have a dose-related risk of vascular disease and hypertension; women with hypertension should be encouraged to use a nonhormonal form of contraception.
- Depression: Use with caution in patients with depression.
- Diseases exacerbated by fluid retention: Use with caution in patients with diseases which may be exacerbated by fluid retention, including asthma, epilepsy, migraine, diabetes or renal dysfunction.
- Gallbladder disease: May have a dose-related risk of gallbladder disease.
- Hepatic impairment: Combination hormonal contraceptives may be poorly metabolized in women with hepatic impairment.
- Migraine: Use with caution in patients with a history of migraine.
- Renal impairment: Women with renal disease should be encouraged to use a nonhormonal form of contraception.

Special populations:

- Pediatrics: Not for use prior to menarche.
- Smokers: **[U.S. Boxed Warning]: The risk of cardiovascular side effects increases in women who smoke cigarettes, especially those who are >35 years of age; women who use combination hormonal contraceptives should be strongly advised not to smoke.**
- Surgical patients: Whenever possible, should be discontinued at least 4 weeks prior to and for 2 weeks following elective surgery associated with an increased risk of thromboembolism or during periods of prolonged immobilization.

Dosage form specific issues:

- Vaginal preparation: Vaginally-administered combination hormonal contraceptive agents may have a similar adverse effects associated with oral contraceptive products. In order to reduce some of the possible risks, the minimum dosage combination of estrogen/progestin that will effectively treat the individual patient should be used. May not be appropriate for use in women with conditions that make the vagina susceptible to irritation or ulceration. Ensure proper vaginal placement of the ring to avoid inadvertent urinary bladder insertion.

Other warnings/precautions:

- HIV infection protection: Combination hormonal contraceptives do not protect against HIV infection or other sexually-transmitted diseases.

Pregnancy Risk Factor X

Pregnancy Considerations Pregnancy should be ruled out prior to treatment and discontinued if pregnancy occurs. In general, the use of combination hormonal contraceptives, when inadvertently used early in pregnancy, have not been associated with teratogenic effects. Due to increased risk of thromboembolism postpartum, do not start earlier than 4-6 weeks following delivery. Hormonal contraceptives may be less effective in obese patients. An increase in oral contraceptive failure was noted in women with a BMI >27.3. Similar findings were noted in patients weighing ≥90 kg (198 lb) using the contraceptive patch.

LactationEnters breast milk/not recommended (AAP rates “compatible”)

Breast-Feeding ConsiderationsJaundice and breast enlargement in the nursing infant have been reported following the use of combination hormonal contraceptives. May decrease the quality and quantity of breast milk; alternative form of contraception is recommended.

Adverse Reactions

The most common adverse reactions associated with NuvaRing® (5% to 14%): Headache, nausea, sinusitis, upper respiratory tract infection, vaginal secretion, vaginitis, and weight gain. The following reactions have been associated with combination hormonal contraceptive use:

Increased risk or evidence of association with use:

Cardiovascular: Arterial thromboembolism, cerebral hemorrhage, cerebral thrombosis, hypertension, mesenteric thrombosis, MI, venous thrombosis (with or without embolism)

Gastrointestinal: Gallbladder disease

Hepatic: Hepatic adenomas, liver tumors (benign)

Local: Thrombophlebitis

Ocular: Retinal thrombosis

Respiratory: Pulmonary embolism

Adverse reactions considered drug related:

Cardiovascular: Edema, varicose vein aggravation

Central nervous system: Depression, migraine, mood changes

Dermatologic: Chloasma, melasma, rash (allergic)

Endocrine & metabolic: Amenorrhea, breakthrough bleeding, breast changes (enlargement, pain, secretion, tenderness), fluid retention, infertility (temporary), lactation decreased (with use immediately postpartum), menstrual flow changes, spotting

Gastrointestinal: Abdominal bloating, abdominal cramps, abdominal pain, appetite changes, nausea, weight changes, vomiting

Genitourinary: Cervical ectropion, cervical secretion, vaginal candidiasis, vaginitis

Hematologic: Folate decreased, porphyria exacerbation

Hepatic: Cholestatic jaundice

Neuromuscular & skeletal: Chorea exacerbation

Ocular: Contact lens intolerance, corneal curvature changes (steepening)

Miscellaneous: Anaphylactic/anaphylactoid reactions (including angioedema, circulatory collapse, respiratory collapse, urticaria), SLE exacerbation

Adverse reactions in which association is not confirmed or denied: Acne, Budd-Chiari syndrome, cataracts, colitis, cystitis-like syndrome, dizziness, dysmenorrhea, erythema multiforme, erythema nodosum, headache, hemolytic uremic syndrome, hemorrhagic eruption, hirsutism, libido changes, nervousness, optic neuritis (with or without partial or complete loss of vision), pancreatitis, premenstrual syndrome, renal function impaired, scalp hair loss

Metabolism/Transport Effects

Ethinyl estradiol: **Substrate** of CYP2C9 (minor), 3A4 (major), 3A5-7 (minor); **Inhibits** CYP1A2 (weak), 2B6 (weak), 2C8 (weak), 2C19 (weak), 3A4 (weak)

Etonogestrel: **Substrate** of CYP3A4 (minor)

Drug Interactions

Acitretin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk X: Avoid combination*

Aminoglutethimide: May increase the metabolism of Progestins. *Risk D: Consider therapy modification*

Aprepitant: May decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Aprepitant: May decrease the serum concentration of Contraceptive (Progestins). *Risk D: Consider therapy modification*

Armodafinil: May decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Barbiturates: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Barbiturates: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Benzodiazepines (metabolized by oxidation): Oral Contraceptive (Estrogens) may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Benzodiazepines (metabolized by oxidation): Oral Contraceptive (Progestins) may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

CarBAMazepine: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

CarBAMazepine: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Colesevelam: May decrease the serum concentration of Ethinyl Estradiol. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Estrogen Derivatives may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Felbamate: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Felbamate: May decrease the serum concentration of Oral Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Fosaprepitant: May decrease the serum concentration of Oral Contraceptive (Estrogens). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Fosaprepitant: May decrease the serum concentration of Contraceptive (Progestins). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Griseofulvin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk X: Avoid combination*

Griseofulvin: May increase the metabolism of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Herbs (Estrogenic Properties): May enhance the adverse/toxic effect of Estrogen Derivatives. *Risk C: Monitor therapy*

Herbs (Progestogenic Properties) (eg, Bloodroot, Yucca): May enhance the adverse/toxic effect of Progestins. *Risk C: Monitor therapy*

LamoTRIgine: Oral Contraceptive (Estrogens) may decrease the serum concentration of LamoTRIgine. *Risk D: Consider therapy modification*

Modafinil: May decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Mycophenolate: May decrease the serum concentration of Oral Contraceptive (Estrogens). Average AUC values were unchanged, but there was evidence of substantial patient-to-patient variability in response to this combination. *Risk D: Consider therapy modification*

Mycophenolate: May decrease the serum concentration of Oral Contraceptive (Progestins). *Risk D: Consider therapy modification*

Nafcillin: May increase the metabolism of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

OXcarbazepine: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

OXcarbazepine: May decrease the serum concentration of Oral Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Phenytoin: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Phenytoin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Protease Inhibitors: Oral Contraceptive (Estrogens) may diminish the therapeutic effect of Protease Inhibitors. Protease Inhibitors may decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Retinoic Acid Derivatives: May diminish the therapeutic effect of Oral Contraceptive (Progestins). Two forms of contraception are recommended in females of child-bearing potential during retinoic acid derivative therapy. **Exceptions:** Adapalene; Alitretinoin; Tretinoin (Topical). *Risk C: Monitor therapy*

Retinoic Acid Derivatives: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Two forms of contraception are recommended in females of child-bearing potential during retinoic acid derivative therapy. **Exceptions:** Adapalene; Alitretinoin; Tretinoin (Topical). *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Rifamycin Derivatives: May decrease the serum concentration of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Ropinirole: Estrogen Derivatives may increase the serum concentration of Ropinirole. *Risk C: Monitor therapy*

Rufinamide: May decrease the serum concentration of Ethinyl Estradiol. *Risk D: Consider therapy modification*

Selegiline: Oral Contraceptive (Estrogens) may increase the serum concentration of Selegiline. *Risk D: Consider therapy modification*

Selegiline: Oral Contraceptive (Progestins) may increase the serum concentration of Selegiline. *Risk D: Consider therapy modification*

St Johns Wort: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

St Johns Wort: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Thyroid Products: Estrogen Derivatives may diminish the therapeutic effect of Thyroid Products. *Risk C: Monitor therapy*

Tipranavir: Estrogen Derivatives may enhance the dermatologic adverse effect of Tipranavir. The combination of tipranavir/ritonavir and ethinyl estradiol/norethindrone was associated with a high incidence of skin rash. Tipranavir may decrease the serum concentration of Estrogen Derivatives. *Risk D: Consider therapy modification*

TiZANidine: Oral Contraceptive (Estrogens) may increase the serum concentration of TiZANidine. *Risk C: Monitor therapy*

Topiramate: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Oral Contraceptive (Estrogens) may diminish the anticoagulant effect of Vitamin K Antagonists. In contrast, enhanced anticoagulant effects have also been noted with some products. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Contraceptive (Progestins) may diminish the anticoagulant effect of Vitamin K Antagonists. In contrast, enhanced anticoagulant effects have also been noted with some products. *Risk D: Consider therapy modification*

Voriconazole: May decrease the metabolism of Oral Contraceptive (Estrogens). Oral Contraceptive (Estrogens) may increase the serum concentration of Voriconazole. *Risk C: Monitor therapy*

Voriconazole: May decrease the metabolism of Oral Contraceptive (Progestins). Oral Contraceptive (Progestins) may increase the serum concentration of Voriconazole. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: CNS effects of caffeine may be enhanced if combination hormonal contraceptives are used concurrently with caffeine. Grapefruit juice increases ethinyl estradiol concentrations and would be expected to increase progesterone serum levels as well; clinical implications are unclear.

Herb/Nutraceutical: St John's wort may decrease levels. Herbs with estrogenic properties may enhance the adverse/toxic effect of estrogen derivatives; examples include alfalfa, black cohosh, bloodroot, hops, kudzu, licorice, red clover, saw palmetto, soybean, thyme, wild yam, yucca. Herbs with progestogenic properties may enhance the adverse/toxic effect of progestins; examples include bloodroot, chasteberry, damiana, oregano, yucca.

Monitoring ParametersBefore starting therapy, a physical exam with reference to the breasts and pelvis are recommended, including a Papanicolaou smear. Exam may be deferred if appropriate; pregnancy should be ruled out prior to use. Monitor patient closely for loss of vision, sudden onset of proptosis, diplopia, migraine; blood pressure; signs and symptoms of thromboembolic disorders; signs or symptoms of depression; glycemic control in patients with diabetes; lipid profiles in patients being treated for hyperlipidemias. Adequate diagnostic measures, including endometrial sampling, if indicated, should be performed to rule out malignancy in all cases of undiagnosed abnormal vaginal bleeding. In patients with persistent urinary symptoms, assess for inadvertent urinary bladder insertion if ring is not otherwise located.

Monitoring: Lab TestsBlood pressure, breast exam, Pap smear, and pregnancy; lipid profiles in patients being treated for hyperlipidemias

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Ring, vaginal:

NuvaRing®: Ethinyl estradiol 0.015 mg/day and etonogestrel 0.12 mg/day (1s) [3-week duration]

Generic AvailableNo

ManufacturerOrganon Inc

Pricing: U.S. (www.drugstore.com)

Ring (NuvaRing)

0.12-0.015 mg/24 hrs (1): $65.03

Mechanism of ActionCombination hormonal contraceptives inhibit ovulation via a negative feedback mechanism on the hypothalamus, which alters the normal pattern of gonadotropin secretion of a follicle-stimulating hormone (FSH) and luteinizing hormone by the anterior pituitary. The follicular phase FSH and midcycle surge of gonadotropins are inhibited. In addition, combination hormonal contraceptives produce alterations in the genital tract, including changes in the cervical mucus, rendering it unfavorable for sperm penetration even if ovulation occurs. Changes in the endometrium may also occur, producing an unfavorable environment for nidation. Combination hormonal contraceptive drugs may alter the tubal transport of the ova through the fallopian tubes. Progestational agents may also alter sperm fertility.

Pharmacodynamics/Kinetics

Duration: Serum levels (contraceptive effectiveness) decrease after 3 weeks of continuous use

Absorption: Ethinyl estradiol and etonogestrel: Rapid

Tampons do not interfere with absorption.

Protein binding:

Ethinyl estradiol: 98%, primarily to albumin

Etonogestrel: 32% to sex hormone-binding globulin (SHBG) and 66% to albumin; SHBG capacity is affected by plasma ethinyl estradiol levels

Metabolism:

Ethinyl estradiol: Hepatic via CYP3A4; forms metabolites (weak estrogenic activity)

Etonogestrel: Hepatic via CYP3A4; forms metabolites (activity not known)

Bioavailability: Vaginal: Ethinyl estradiol: ~56% Etonogestrel: 100%

Half-life elimination: Ethinyl estradiol: 45 hours; Etonogestrel: 29 hours

Time to peak: Vaginal: Ethinyl estradiol: 60 hours; Etonogestrel: 200 hours

Excretion: Ethinyl estradiol and etonogestrel: Urine, bile, and feces

Dental Health: Effects on Dental TreatmentWhen prescribing antibiotics, patient must be warned to use additional methods of birth control if on oral contraceptives.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, headache, depression, insomnia, nervousness, irritability, and mood disturbances

Mental Health: Effects on Psychiatric TreatmentMay cause flu-like symptoms, take this into consideration if also concerned about SSRI discontinuation syndrome. Carbamazepine and topiramate may increase the metabolism of estradiol, leading to a decrease in serum concentrations. Estrogens may inhibit the metabolism of some benzodiazepines (alprazolam, chlordiazepoxide, diazepam), TCAs, and selegiline. Estrogens may increase the clearance of lorazepam, oxazepam, and temazepam. The Women's Health Initiative (WHI) Memory Study reported an increased risk of developing dementia in postmenopausal women ≥65 years of age during 4 years of treatment with oral conjugated equine estrogens and medroxyprogesterone acetate relative to placebo (1.8% vs 0.9%). Relative risk was 2.05 (95% CI 1.21-3.48). Therefore, estrogens and progestins should not be used for the prevention of dementia. The WHI also reported an increased risk of stroke (29 vs 21 per 10,000 women-years) compared to women receiving placebo. The increase in risk was observed after the first year and persisted. May cause hypertriglyceridemia; monitor in patients receiving antipsychotics especially clozapine, olanzapine, and quetiapine.

Index TermsEtonogestrel and Ethinyl Estradiol

Pharmacologic CategoryContraceptive; Estrogen and Progestin Combination

Use: Labeled IndicationsPrevention of pregnancy; postcoital contraception

Use: Unlabeled/InvestigationalTreatment of hypermenorrhea (menorrhagia); pain associated with endometriosis; dysmenorrhea; dysfunctional uterine bleeding

Dosing: AdultsFemales:

Contraception, 28-day cycle: Oral:

Schedule 1 (Sunday starter): Dose begins on first Sunday after onset of menstruation; if the menstrual period starts on Sunday, take first tablet that very same day. With a Sunday start, an additional method of contraception should be used until after the first 7 days of consecutive administration:

For 21-tablet package: 1 tablet/day for 21 consecutive days, followed by 7 days off of the medication; a new course begins on the 8th day after the last tablet is taken

For 28-tablet package: 1 tablet/day without interruption

Schedule 2 (Day-1 starter): Dose starts on first day of menstrual cycle taking 1 tablet/day:

For 21-tablet package: 1 tablet/day for 21 consecutive days, followed by 7 days off of the medication; a new course begins on the 8th day after the last tablet is taken

For 28-tablet package: 1 tablet/day without interruption

If all doses have been taken on schedule and one menstrual period is missed, continue dosing cycle. If two consecutive menstrual periods are missed, pregnancy test is required before new dosing cycle is started.

Missed doses **monophasic formulations** (refer to package insert for complete information):

One dose missed: Take as soon as remembered or take 2 tablets next day

Two consecutive doses missed in the first 2 weeks: Take 2 tablets as soon as remembered or 2 tablets next 2 days. An additional method of contraception should be used for 7 days after missed dose.

Two consecutive doses missed in week 3 or three consecutive doses missed at any time: An additional method of contraception must be used for 7 days after a missed dose:

Schedule 1 (Sunday starter): Continue dose of 1 tablet daily until Sunday, then discard the rest of the pack, and a new pack should be started that same day.

Schedule 2 (Day-1 starter): Current pack should be discarded, and a new pack should be started that same day.

Missed doses **biphasic/triphasic formulations** (refer to package insert for complete information):

One dose missed: Take as soon as remembered or take 2 tablets next day.

Two consecutive doses missed in week 1 or week 2 of the pack: Take 2 tablets as soon as remembered and 2 tablets the next day. Resume taking 1 tablet daily until the pack is empty. An additional method of contraception should be used for 7 days after a missed dose.

Two consecutive doses missed in week 3 of the pack: An additional method of contraception must be used for 7 days after a missed dose.

Schedule 1 (Sunday starter): Take 1 tablet every day until Sunday. Discard the remaining pack and start a new pack of pills on the same day.

Schedule 2 (Day-1 starter): Discard the remaining pack and start a new pack the same day.

Three or more consecutive doses missed: An additional method of contraception must be used for 7 days after a missed dose.

Schedule 1 (Sunday starter): Take 1 tablet every day until Sunday; on Sunday, discard the pack and start a new pack.

Schedule 2 (Day-1 starter): Discard the remaining pack and begin new pack of tablets starting on the same day.

Contraception, 91-day cycle (extended cycle regimen): Dose begins on first Sunday after onset of menstruation; if the menstrual period starts on Sunday, take first tablet that very same day. An additional method of contraception should be used until after the first 7 days of consecutive administration:

Seasonale®: One active tablet/day for 84 consecutive days, followed by 1 inactive tablet/day for 7 days; if all doses have been taken on schedule and one menstrual period is missed, pregnancy should be ruled out prior to continuing therapy.

Seasonique™: One active tablet/day for 84 consecutive days, followed by 1 low dose estrogen tablet/day for 7 days; if all doses have been taken on schedule and one menstrual period is missed, pregnancy should be ruled out prior to continuing therapy.

Missed doses:

One dose missed: Take as soon as remembered or take 2 tablets the next day

Two consecutive doses missed: Take 2 tablets as soon as remembered or 2 tablets the next 2 days. An additional nonhormonal method of contraception should be used for 7 consecutive days after the missed dose.

Three or more consecutive doses missed: Do not take the missed doses; continue taking 1 tablet/day until pack is complete. Bleeding may occur during the following week. An additional nonhormonal method of contraception should be used for 7 consecutive days after the missed dose.

Any number of pills during week 13: Throw away the missed pills and keep taking scheduled pills until the pack is finished. A back-up method of contraception is not needed

Contraception, continuous use (extended cycle regimen): Oral: Lybrel™: Take one tablet daily, at the same time each day, without a tablet-free interval. Therapy should be initiated as follows:

No previous contraception: Begin on the first day of menstrual cycle. Back-up contraception is not needed.

Previously taking a 21-day or 28-day combination hormonal contraceptive: Begin on day 1 of the withdrawal bleed (at the latest, 7 days after the last active tablet). Back-up contraception is not needed.

Previously using a progestin-only pill: Begin the day after taking a progestin only pill. Back-up contraception is needed for the first 7 days of therapy.

Previously using contraceptive implant: Begin the day of implant removal. Back-up contraception is needed for the first 7 days of therapy.

Previously using contraceptive injection: Begin when the next injection is due. Back-up contraception is needed for the first 7 days of therapy.

Missed doses:

One dose missed: Take as soon as remembered then take the next tablet at the regular time (2 tablets in 1 day). An additional nonhormonal method of contraception should also be used for 7 consecutive days.

Two consecutive doses missed: If remembered the day of the second missed tablet, take 2 tablets as soon as remembered, then 1 tablet the next day. If remembered the day after the second tablet is missed, take 2 tablets the day remembered, then 2 tablets the next day. An additional nonhormonal method of contraception should also be used for 7 consecutive days.

Three or more consecutive doses missed: Take 1 tablet daily and contact healthcare provider; do not take the missed pills. An additional nonhormonal method of contraception should also be used for 7 consecutive days.

Dosing: PediatricFemales: Contraception or emergency contraception: Oral: Refer to adult dosing; not to be used prior to menarche.

Dosing: Renal ImpairmentSpecific guidelines not available; use with caution and monitor blood pressure closely. Consider other forms of contraception.

Dosing: Hepatic ImpairmentContraindicated in patients with hepatic impairment.

Administration: OralAdminister at the same time each day.

Dietary ConsiderationsShould be taken at the same time each day.

StorageStore at controlled room temperature of 20°C to 25°C (68°F to 77°F).

ContraindicationsHypersensitivity to ethinyl estradiol, levonorgestrel, or any component of the formulation; history of or current thrombophlebitis or venous thromboembolic disorders (including DVT, PE); active or recent (within 1 year) arterial thromboembolic disease (eg, stroke, MI); cerebral vascular disease, coronary artery disease, valvular heart disease with complications, severe/uncontrolled hypertension, thrombogenic rhythm disorders, hereditary or acquired thrombophilias; diabetes mellitus with vascular involvement; severe headache with focal neurological symptoms; known or suspected breast carcinoma, endometrial cancer, estrogen-dependent neoplasms, undiagnosed abnormal genital bleeding; hepatic dysfunction or tumor, cholestatic jaundice of pregnancy, jaundice with prior combination hormonal contraceptive use; major surgery with prolonged immobilization; heavy smoking (≥15 cigarettes/day) in patients >35 years of age; pregnancy

Canadian-labeling: Additional contraindication: Ocular lesions due to ophthalmic vascular disease including partial or complete loss of vision or defect in visual fields; severe dyslipoproteinemia; hereditary or acquired predisposition for venous or arterial thrombosis

Allergy Considerations

- Estrogen Allergy

Warnings/Precautions

Boxed warnings:

- Smokers: See “Special populations” below.

Concerns related to adverse effects:

- Breast cancer: The use of combination hormonal contraceptives has been associated with a slight increase in frequency of breast cancer, however, studies are not consistent.
- Carbohydrate intolerance: May have adverse effects on glucose tolerance; use caution in women with diabetes.
- Lipid effects: Combination hormonal contraceptives may affect serum triglyceride and lipoprotein levels. Estrogen compounds are generally associated with lipid effects such as increased HDL-cholesterol and decreased LDL-cholesterol. Triglycerides may also be increased; use with caution in patients with familial defects of lipoprotein metabolism.
- Retinal vascular thrombosis: Estrogens may cause retinal vascular thrombosis (has been reported rarely with combination hormonal contraceptives); discontinue permanently if papilledema or retinal vascular lesions are observed on examination.
- Thromboembolism: May increase the risk of thromboembolism.
- Vaginal bleeding: Presentation of irregular, unresolving vaginal bleeding warrants further evaluation including endometrial sampling, if indicated, to rule out malignancy; evaluate hypothalamic-pituitary-function in women with persistent (≥6 months) amenorrhea (especially associated with breast secretion) following discontinuation of therapy.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with risk factors for coronary artery disease; may lead to increased risk of myocardial infarction. May have a dose-related risk of vascular disease and hypertension; women with hypertension should be encouraged to use a nonhormonal form of contraception.
- Depression: Use with caution in patients with depression.
- Diseases exacerbated by fluid retention: Use with caution in patients with diseases which may be exacerbated by fluid retention, including asthma, epilepsy, migraine, diabetes or renal dysfunction.
- Fibroids: Discontinue use with the onset of sudden enlargement, pain, or tenderness of fibroids (leiomyomata).
- Gallbladder disease: May have a dose-related risk of gallbladder disease; may worsen existing gallbladder disease.
- Hepatic adenomas: Extremely rare adenomas and focal nodular hyperplasia resulting in fatal intra-abdominal hemorrhage have been reported in association with long-term oral contraceptive use. Presentation of an abdominal mass, acute abdominal pain, or intra-abdominal bleeding warrants further evaluation to rule out source.
- Migraine: Use with caution in patients with a history of migraine.
- Renal impairment: Women with renal disease should be encouraged to use a nonhormonal form of contraception.

Special populations:

- Pediatrics: Not for use prior to menarche.
- Smokers: **[U.S. Boxed Warning]: The risk of cardiovascular side effects increases in women who smoke cigarettes, especially those who are >35 years of age; women who use combination hormonal contraceptives should be strongly advised not to smoke.**
- Surgical patients: Whenever possible, should be discontinued at least 4 weeks prior to and for 2 weeks following elective surgery associated with an increased risk of thromboembolism or during periods of prolonged immobilization.

Other warnings/precautions:

- HIV infection protection: Combination hormonal contraceptives do not protect against HIV infection or other sexually-transmitted diseases.
- Extended cycle regimen: Contraceptives with an extended cycle regimen provide more hormonal exposure per year than conventional monthly contraceptives.
- Minimum effective dosage: The minimum dosage combination of estrogen/progestin that will effectively treat the individual patient should be used. New patients should be started on products containing ≤0.035 mg of estrogen per tablet.

Pregnancy Risk FactorX

Pregnancy ConsiderationsPregnancy should be ruled out prior to treatment and discontinued if pregnancy occurs. In general, the use of combination hormonal contraceptives when inadvertently taken early in pregnancy have not been associated with teratogenic effects. Due to increased risk of thromboembolism postpartum, combination hormonal contraceptives should not be started earlier than 4-6 weeks following delivery. Hormonal contraceptives may be less effective in obese patients. An increase in oral contraceptive failure was noted in women with a BMI >27.3. Similar findings were noted in patients weighing ≥90 kg (198 lb) using the contraceptive patch.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsJaundice and breast enlargement in the nursing infant have been reported following the use of combination hormonal contraceptives. May decrease the quality and quantity of breast milk; alternative form of contraception is recommended.

Adverse ReactionsThe following reactions have been associated with oral contraceptive use:

Increased risk or evidence of association with use:

Cardiovascular: Arterial thromboembolism, cerebral hemorrhage, cerebral thrombosis, hypertension, mesenteric thrombosis, MI, venous thrombosis (with or without embolism)

Gastrointestinal: Gallbladder disease

Hepatic: Hepatic adenomas, liver tumors (benign)

Local: Thrombophlebitis

Ocular: Retinal thrombosis

Respiratory: Pulmonary embolism

Adverse reactions considered drug related:

Cardiovascular: Edema, varicose vein aggravation

Central nervous system: Depression, migraine, mood changes

Dermatologic: Chloasma, melasma, rash (allergic)

Endocrine & metabolic: Amenorrhea, breakthrough bleeding, breast changes (enlargement, pain, secretion, tenderness), carbohydrate tolerance decreased, fluid retention, infertility (temporary), lactation decreased (with use immediately postpartum), menstrual flow changes, spotting

Gastrointestinal: Abdominal bloating, abdominal cramps, abdominal pain, appetite changes, nausea, weight changes, vomiting

Genitourinary: Cervical ectropion, cervical secretion/erosion, endocervical hyperplasia, fibroid enlargement, vaginal candidiasis, vaginitis

Hematologic: Folate decreased, porphyria exacerbation

Hepatic: Cholestatic jaundice, focal nodular hyperplasia

Neuromuscular & skeletal: Chorea exacerbation

Ocular: Contact lens intolerance, corneal curvature changes (steepening)

Respiratory: Rhinitis

Miscellaneous: Anaphylactic/anaphylactoid reactions (including angioedema, circulatory collapse, respiratory collapse, urticaria), SLE exacerbation

Adverse reactions in which association is not confirmed or denied: Acne, auditory disturbances, Budd-Chiari syndrome, cataracts, cervical smear abnormal, colitis, cystitis-like syndrome, dizziness, dysmenorrhea, erythema multiforme, erythema nodosum, headache, hemolytic uremic syndrome, hemorrhagic eruption, hirsutism, libido changes, nervousness, optic neuritis (with or without partial or complete loss of vision), pancreatitis, premenstrual syndrome, renal function impaired, scalp hair loss

Metabolism/Transport Effects

Ethinyl estradiol: **Substrate** of CYP2C9 (minor), 3A4 (major), 3A5-7 (minor); **Inhibits** CYP1A2 (weak), 2B6 (weak), 2C8 (weak), 2C19 (weak), 3A4 (weak)

Levonorgestrel: **Substrate** of CYP3A4 (major)

Drug Interactions

Acitretin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk X: Avoid combination*

Aminoglutethimide: May increase the metabolism of Progestins. *Risk D: Consider therapy modification*

Aprepitant: May decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Aprepitant: May decrease the serum concentration of Contraceptive (Progestins). *Risk D: Consider therapy modification*

Armodafinil: May decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Barbiturates: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Barbiturates: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy*

modification

Benzodiazepines (metabolized by oxidation): Oral Contraceptive (Estrogens) may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Benzodiazepines (metabolized by oxidation): Oral Contraceptive (Progestins) may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

CarBAMazepine: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

CarBAMazepine: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Colesevelam: May decrease the serum concentration of Ethinyl Estradiol. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Estrogen Derivatives may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Felbamate: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Felbamate: May decrease the serum concentration of Oral Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Fosaprepitant: May decrease the serum concentration of Oral Contraceptive (Estrogens). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Fosaprepitant: May decrease the serum concentration of Contraceptive (Progestins). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Griseofulvin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk X: Avoid combination*

Griseofulvin: May increase the metabolism of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Herbs (Estrogenic Properties): May enhance the adverse/toxic effect of Estrogen Derivatives. *Risk C: Monitor therapy*

Herbs (Progestogenic Properties) (eg, Bloodroot, Yucca): May enhance the adverse/toxic effect of Progestins. *Risk C: Monitor therapy*

LamoTRIgine: Oral Contraceptive (Estrogens) may decrease the serum concentration of LamoTRIgine. *Risk D: Consider therapy modification*

Modafinil: May decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Mycophenolate: May decrease the serum concentration of Oral Contraceptive (Estrogens). Average AUC values were unchanged, but there was evidence of substantial patient-to-patient variability in response to this combination. *Risk D: Consider therapy modification*

Mycophenolate: May decrease the serum concentration of Oral Contraceptive (Progestins). *Risk D: Consider therapy modification*

Nafcillin: May increase the metabolism of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

OXcarbazepine: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

OXcarbazepine: May decrease the serum concentration of Oral Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Phenytoin: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Phenytoin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Protease Inhibitors: Oral Contraceptive (Estrogens) may diminish the therapeutic effect of Protease Inhibitors. Protease Inhibitors may decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Retinoic Acid Derivatives: May diminish the therapeutic effect of Oral Contraceptive (Progestins). Two forms of contraception are recommended in females of child-bearing potential during retinoic acid derivative therapy. **Exceptions:** Adapalene; Alitretinoin; Tretinoin (Topical). *Risk C: Monitor therapy*

Retinoic Acid Derivatives: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Two forms of contraception are recommended in females of child-bearing potential during retinoic acid derivative therapy. **Exceptions:** Adapalene; Alitretinoin; Tretinoin (Topical). *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Rifamycin Derivatives: May decrease the serum concentration of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Ropinirole: Estrogen Derivatives may increase the serum concentration of Ropinirole. *Risk C: Monitor therapy*

Rufinamide: May decrease the serum concentration of Ethinyl Estradiol. *Risk D: Consider therapy modification*

Selegiline: Oral Contraceptive (Estrogens) may increase the serum concentration of Selegiline. *Risk D: Consider therapy modification*

Selegiline: Oral Contraceptive (Progestins) may increase the serum concentration of Selegiline. *Risk D: Consider therapy modification*

St Johns Wort: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

St Johns Wort: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Thyroid Products: Estrogen Derivatives may diminish the therapeutic effect of Thyroid Products. *Risk C: Monitor therapy*

Tipranavir: Estrogen Derivatives may enhance the dermatologic adverse effect of Tipranavir. The combination of tipranavir/ritonavir and ethinyl estradiol/norethindrone was associated with a high incidence of skin rash. Tipranavir may decrease the serum concentration of Estrogen Derivatives. *Risk D: Consider therapy modification*

TiZANidine: Oral Contraceptive (Estrogens) may increase the serum concentration of TiZANidine. *Risk C: Monitor therapy*

Topiramate: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Oral Contraceptive (Estrogens) may diminish the anticoagulant effect of Vitamin K Antagonists. In contrast, enhanced anticoagulant effects have also been noted with some products. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Contraceptive (Progestins) may diminish the anticoagulant effect of Vitamin K Antagonists. In contrast, enhanced anticoagulant effects have also been noted with some products. *Risk D: Consider therapy modification*

Voriconazole: May decrease the metabolism of Oral Contraceptive (Estrogens). Oral Contraceptive (Estrogens) may increase the serum concentration of Voriconazole. *Risk C: Monitor therapy*

Voriconazole: May decrease the metabolism of Oral Contraceptive (Progestins). Oral Contraceptive (Progestins) may increase the serum concentration of Voriconazole. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: CNS effects of caffeine may be enhanced if combination hormonal contraceptives are used concurrently with caffeine. Grapefruit juice increases ethinyl estradiol concentrations and would be expected to increase progesterone serum levels as well; clinical implications are unclear.

Herb/Nutraceutical: St John's wort may decrease levels. Herbs with estrogenic properties may enhance the adverse/toxic effect of estrogen derivatives; examples include alfalfa, black cohosh, bloodroot, hops, kudzu, licorice, red clover, saw palmetto, soybean, thyme, wild yam, yucca. Herbs with progestogenic properties may enhance the adverse/toxic effect of progestins; examples include bloodroot, chasteberry, damiana, oregano, yucca. Impaired folate metabolism and reduced serum levels of cyanocobalamin have been reported with oral contraceptive use; increased dietary intake or supplementation may be necessary.

Test InteractionsIncreased prothrombin and factors VII, VIII, IX, X; increased platelet aggregability, thyroid-binding globulin, total thyroid hormone (T4), serum triglycerides/phospholipids, AST, Alkaline Phosphatase, GGT; decreased serum folate concentration; pathologist should be advised of estrogen/progesterone therapy when specimens are submitted. Oral contraceptives suppress LH and FSH levels; wait at least 2 weeks after discontinuing use of contraceptive before measuring.

Monitoring ParametersBefore starting therapy, a physical exam with reference to the breasts and pelvis are recommended, including a Papanicolaou smear. Exam may be deferred if appropriate; pregnancy should be ruled out prior to use. Monitor patient closely for loss of vision, sudden onset of proptosis, diplopia, migraine; blood pressure; signs and symptoms of thromboembolic disorders; signs or symptoms of depression; glycemic control in patients with diabetes; lipid profiles in patients being treated for hyperlipidemias. Adequate diagnostic measures, including endometrial sampling, if indicated, should be performed to rule out malignancy in all cases of undiagnosed abnormal vaginal bleeding.

Nursing: Physical Assessment/MonitoringSee Levonorgestrel monograph.

Patient EducationSee Levonorgestrel monograph.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Tablet, low-dose formulations:

Alesse® 28: Ethinyl estradiol 0.02 mg and levonorgestrel 0.1 mg (28s) [21 pink tablets and 7 light green inactive tablets]

Aviane™ 28: Ethinyl estradiol 0.02 mg and levonorgestrel 0.1 mg (28s) [21 orange tablets and 7 light green inactive tablets]

Lessina™ 28, Levlite™ 28: Ethinyl estradiol 0.02 mg and levonorgestrel 0.1 mg (28s) [21 pink tablets and 7 white inactive tablets]

Lutera™, Sronyx™: Ethinyl estradiol 0.02 mg and levonorgestrel 0.1 mg (28s) [21 white tablets and 7 peach inactive tablets]

Lybrel™: Ethinyl estradiol 0.02 mg and levonorgestrel 0.09 mg (28s) [28 yellow tablets]

Tablet, monophasic formulations:

Levlen® 28: Ethinyl estradiol 0.03 mg and levonorgestrel 0.15 mg (28s) [21 light orange tablets and 7 pink inactive tablets]

Levora® 28: Ethinyl estradiol 0.03 mg and levonorgestrel 0.15 mg (28s) [21 white tablets and 7 peach inactive tablets]

Nordette® 28: Ethinyl estradiol 0.03 mg and levonorgestrel 0.15 mg (28s) [21 light orange tablets and 7 pink inactive tablets]

Portia™ 28: Ethinyl estradiol 0.03 mg and levonorgestrel 0.15 mg (28s) [21 pink tablets and 7 white inactive tablets]

Tablet, monophasic formulations [extended cycle regimen]:

Jolessa™, Seasonale®: Ethinyl estradiol 0.03 mg and levonorgestrel 0.15 mg (91s) [84 pink tablets and 7 white inactive tablets]

Quasense™: Ethinyl estradiol 0.03 mg and levonorgestrel 0.15 mg (91s) [84 white tablets and 7 peach inactive tablets]

Seasonique™: Ethinyl estradiol 0.03 mg and levonorgestrel 0.15 mg (91s) [84 light blue-green tablets] and ethinyl estradiol 0.01 mg [7 yellow tablets]

Tablet, triphasic formulations:

Enpresse™:

Day 1-6: Ethinyl estradiol 0.03 mg and levonorgestrel 0.05 mg [6 pink tablets]

Day 7-11: Ethinyl estradiol 0.04 mg and levonorgestrel 0.075 mg [5 white tablets]

Day 12-21: Ethinyl estradiol 0.03 mg and levonorgestrel 0.125 mg [10 orange tablets]

Day 22-28: 7 light green inactive tablets (28s)

Triphasil® 28:

Day 1-6: Ethinyl estradiol 0.03 mg and levonorgestrel 0.05 mg [6 brown tablets]

Day 7-11: Ethinyl estradiol 0.04 mg and levonorgestrel 0.075 mg [5 white tablets]

Day 12-21: Ethinyl estradiol 0.03 mg and levonorgestrel 0.125 mg [10 light yellow tablets]

Day 22-28: 7 light green inactive tablets (28s)

Trivora® 28:

Day 1-6: Ethinyl estradiol 0.03 mg and levonorgestrel 0.05 mg [6 blue tablets]

Day 7-11: Ethinyl estradiol 0.04 mg and levonorgestrel 0.075 mg [5 white tablets]

Day 12-21: Ethinyl estradiol 0.03 mg and levonorgestrel 0.125 mg [10 pink tablets]

Day 22-28: 7 peach inactive tablets (28s)

Mechanism of ActionCombination hormonal contraceptives inhibit ovulation via a negative feedback mechanism on the hypothalamus, which alters the normal pattern of gonadotropin secretion of a follicle-stimulating hormone (FSH) and luteinizing hormone by the anterior pituitary. The follicular phase FSH and midcycle surge of gonadotropins are inhibited. In addition, combination hormonal contraceptives produce alterations in the genital tract, including changes in the cervical mucus, rendering it unfavorable for sperm penetration even if ovulation occurs. Changes in the endometrium may also occur, producing an unfavorable environment for nidation. Combination hormonal contraceptive drugs may alter the tubal transport of the ova through the fallopian tubes. Progestational agents may also alter sperm fertility.

Pharmacodynamics/Kinetics

Absorption: Rapid

Distribution: Ethinyl estradiol: 4.3 L/kg; Levonorgestrel: 1.8 L/kg

Protein binding:

Ethinyl estradiol: 95% to 97% to albumin

Levonorgestrel: 97% to 99% primarily to sex hormone binding globulin (SHBG), lesser amounts to albumin

Metabolism:

Ethinyl estradiol: Hepatic via CYP3A4; undergoes first-pass metabolism; forms metabolites

Levonorgestrel: Forms conjugated in unconjugated metabolites

Bioavailability: Ethinyl estradiol: 38% to 48%; Levonorgestrel: 100%

Half-life elimination: Ethinyl estradiol: 12-23 hours; Levonorgestrel: 22-49 hours

Excretion:

Ethinyl estradiol: Urine and feces

Levonorgestrel: Urine (40% to 68%, parent drug and metabolites); feces (16% to 48% as metabolites)

Pharmacotherapy PearlsThe World Health Organization (WHO) has issued revised management recommendations for missed combined oral contraceptive pills. Refer to the following reference for a complete presentation and discussion of the guidelines:

Faculty of Family Planning and Reproductive Health Care Clinical Effectiveness Unit, "Faculty Statement from the CEU on a New Publication: WHO Selected Practice Recommendations for Contraceptive Use Update. Missed Pills: New Recommendations," *J Fam Plann Reprod Health Care*, 2005, 31(2):153-5.

Dental Health: Effects on Dental TreatmentWhen prescribing antibiotics, patient must be warned to use additional methods of birth control if on oral contraceptives.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, headache, depression, insomnia, nervousness, irritability, and mood disturbances

Mental Health: Effects on Psychiatric TreatmentBarbiturates decrease the effects of oral contraceptives; may increase the toxicity of the benzodiazepines and TCAs. The Women's Health Initiative (WHI) Memory Study reported an increased risk of developing dementia in postmenopausal women ≥65 years of age during 4 years of treatment with oral conjugated equine estrogens and medroxyprogesterone acetate relative to placebo (1.8% vs 0.9%). Relative risk was 2.05 (95% CI 1.21-3.48). Therefore, estrogens and progestins should not be used for the prevention of dementia. The WHI also reported an increased risk of stroke (29 vs 21 per 10,000 women-years) compared to women receiving placebo. The increase in risk was observed after the first year and persisted. May cause hypertriglyceridemia; monitor in patients receiving antipsychotics especially clozapine, olanzapine, and quetiapine.

Cardiovascular ConsiderationsIt is important to recognize that hormone-based contraceptives may induce or worsen hypertension. These problems are less severe with low-dose ones. Furthermore, hormone-based contraceptives may precipitate thromboembolic events, particularly in women who smoke. It is important that patients on these contraceptives long-term undergo monitoring of blood pressure and avoid cigarette use.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Special Alerts

Ortho Evra® and Venous Thromboembolism - January, 2008

The Food and Drug Administration (FDA) has notified healthcare professionals of updated labeling related to the use of Ortho Evra® (ethinyl estradiol and norelgestromin). Results from a third study that illustrates the increased risk of venous thromboembolism (VTE) with the use of the contraceptive patch have been released.

Product labeling now contains information from three epidemiologic studies based on information obtained from electronic healthcare claims data. The first study found the risk of nonfatal VTE associated with the use of Ortho Evra® patch was similar to the risk associated with use of oral contraceptive pills containing ethinyl estradiol 35 mcg and norgestimate. The second study found an approximate twofold increase in the risk of medically verified VTE events in users of Ortho Evra® compared to users of norgestimate-containing oral contraceptives containing ethinyl estradiol 35 mcg. The third study found an increased risk of VTE in women using Ortho Evra® compared to those using oral contraceptives containing ethinyl estradiol 30 mcg and levonorgestrel.

Although the results and methods of the studies differ, two of the studies support the FDA's concerns regarding the potential for Ortho Evra® use to increase the risk of blood clots in some women.

Women with concerns or risk factors for thromboembolic disease should consult with their healthcare providers for appropriate contraceptive options.

For additional information, refer to the following FDA website: http://www.fda.gov/medwatch/safety/2008/safety08.htm#orthoevrapatch

Medication Safety Issues

Transdermal patch may contain conducting metal (eg, aluminum); remove patch prior to MRI.

Pronunciation(ETH in il es tra DYE ole & nor el JES troe min)

U.S. Brand NamesOrtho Evra®

Canadian Brand NamesEvra®

Pharmacologic CategoryContraceptive; Estrogen and Progestin Combination

Use: Labeled IndicationsPrevention of pregnancy

Dosing: AdultsFemales: Contraception: Topical:

Apply one patch each week for 3 weeks (21 total days); followed by one week that is patch-free. Each patch should be applied on the same day each week (“patch change day”) and only one patch should be worn at a time. No more than 7 days should pass during the patch-free interval.

Schedule 1 (Sunday starter): Dose begins on first Sunday after onset of menstruation; if the menstrual period starts on Sunday, apply one patch that very same day. **With a Sunday start, an additional method of contraception (nonhormonal) should be used until after the first 7 days of consecutive administration.** Each patch change will then occur on Sunday.

Schedule 2 (Day 1 starter): Dose starts on first day of menstrual cycle, applying one patch during the first 24 hours of menstrual cycle. No back-up method of contraception is needed as long as the patch is applied on the first day of cycle. Each patch change will then occur on that same day of the week.

Additional dosing considerations:

No bleeding during patch-free week/missed menstrual period: If patch has been applied as directed, continue treatment on usual “patch change day”. If used correctly, no bleeding during patch-free week does not necessarily indicate pregnancy. However, if no withdrawal bleeding occurs for 2 consecutive cycles, pregnancy should be ruled out. If patch has not been applied as directed, and one menstrual period is missed, pregnancy should be ruled out prior to continuing treatment.

If a patch becomes partially or completely detached for <24 hours: Try to reapply to same place, or replace with a new patch immediately. Do not reapply if patch is no longer sticky, if it is sticking to itself or another surface, or if it has material sticking to it.

If a patch becomes partially or completely detached for >24 hours (or time period is unknown): Apply a new patch and use this day of the week as the new “patch change day” from this point on. **An additional method of contraception (nonhormonal) should be used until after the first 7 days of consecutive administration.**

Switching from oral contraceptives: Apply first patch on the first day of withdrawal bleeding. If there is no bleeding within 5 days of taking the last active tablet, pregnancy must first be ruled out. If patch is applied later than the first day of bleeding, **an additional method of contraception (nonhormonal) should be used until after the first 7 days of consecutive administration**

Use after childbirth: Therapy should not be started <4 weeks after childbirth. Pregnancy should be ruled out prior to treatment if menstrual periods have not restarted. **An additional method of contraception (nonhormonal) should be used until after the first 7 days of consecutive administration.**

Use after abortion or miscarriage: Therapy may be started immediately if abortion/miscarriage occur within the first trimester. If therapy is not started within 5 days, follow instructions for first time use. If abortion/miscarriage occur during the second trimester, therapy should not be started for at least 4 weeks. Follow directions for use after childbirth.

Dosing: PediatricFemales: Contraception: Topical: Refer to adult dosing; not to be used prior to menarche.
Dosing: Renal ImpairmentSpecific guidelines not available; use with caution and monitor blood pressure closely. Consider other forms of contraception
Dosing: Hepatic ImpairmentContraindicated in patients with hepatic impairment.
Administration: TopicalNew patches should be applied on the same day each week. Apply to clean, dry, intact, healthy skin on the buttock, abdomen, upper arm, or upper torso. Avoid areas that will be rubbed by tight clothing. Do not apply to the breasts or to skin that is red, irritated, or cut. Do not apply make-up, creams, lotions, powders, or other topical products to the skin where the patch will be placed. Remove the patch and the plastic liner from the foil pouch, being careful not to remove the clear liner when removing the patch. Apply patch by first peeling back half of the clear protective liner. Avoid touching surface of patch. Apply patch to skin and remove the rest of the liner. Press patch down firmly onto skin using palm of the hand; apply pressure for 10 seconds. When changing the patch each week, the new patch may be applied in the same anatomic area but should be applied to a new spot in that area. Do not use supplemental adhesives or wraps to hold patch into place.

Forgetting to apply the patch at the start of cycle (week 1/day 1): Apply first patch as soon as remembering, using this day of the week as the new “patch change day” from this point on. An additional method of contraception (nonhormonal) should be used until after the first 7 days of consecutive administration.

Forgetting to change patch in the middle of the cycle (week 2/day 8 or week 3/day 15): If <48 hours from normal “patch change day,” apply new patch immediately. No back-up contraception is needed. If >48 hours from normal “patch change day,” apply a new patch and use this day of the week as the new “patch change day” from this point on. An additional method of contraception (nonhormonal) should be used until after the first 7 days of consecutive administration.

Forgetting to remove patch at end of cycle (week 4/day 22): Take off as soon as remembering, start new cycle on usual “patch change day.”

Changing the “patch change day”: The “patch change day” can be changed to an earlier day in the week by first completing the current cycle. Then, during the “patch-free interval”, select an earlier day to start the new cycle. Do not allow >7 consecutive patch-free days.

Skin irritation: If patch is in an uncomfortable location, it can be removed and a new patch applied to a different location until the next “patch change day.”

StorageStore at controlled room temperature of 25°C (77°F); do not refrigerate or freeze.
ContraindicationsHypersensitivity to ethinyl estradiol, norelgestromin, or any component of the formulation; history of or current thrombophlebitis or venous thromboembolic disorders (including DVT, PE); active or recent (within 1 year) arterial thromboembolic disease (eg, stroke, MI); cerebral vascular disease, coronary artery disease, valvular heart disease with complications, severe hypertension; diabetes mellitus with vascular involvement; severe headache with focal neurological symptoms; known or suspected breast carcinoma, endometrial cancer, estrogen-dependent neoplasms, undiagnosed abnormal genital bleeding; hepatic dysfunction or tumor, cholestatic jaundice of pregnancy, jaundice with prior combination hormonal contraceptive use; major surgery with prolonged immobilization; heavy smoking (≥15 cigarettes/day) in patients >35 years of age; pregnancy
Allergy Considerations

- Estrogen Allergy

Warnings/Precautions

Boxed warnings:

- Smokers: See “Special populations” below.

Concerns related to adverse effects:

- Breast cancer: The use of combination hormonal contraceptives has been associated with a slight increase in frequency of breast cancer, however, studies are not consistent.

- Carbohydrate intolerance: May have adverse effects on glucose tolerance; use caution in women with diabetes.

- Lipid effects: Combination hormonal contraceptives may effect serum triglyceride and lipoprotein levels. Estrogen compounds are generally associated with lipid effects such as increased HDL-cholesterol and decreased LDL-cholesterol. Triglycerides may also be increased; use with caution in patients with familial defects of lipoprotein metabolism.

- Retinal vascular thrombosis: Estrogens may cause retinal vascular thrombosis (has been reported rarely with combination hormonal contraceptives); discontinue permanently if papilledema or retinal vascular lesions are observed on examination.

- Thromboembolism: Combination hormonal contraceptive use may increase the risk of venous thromboembolism; risk may be increased with use of the contraceptive patch.

- Vaginal bleeding: Presentation of irregular, unresolving vaginal bleeding warrants further evaluation including endometrial sampling, if indicated, to rule out malignancy; evaluate hypothalamic-pituitary-function in women with persistent (≥6 months) amenorrhea (especially associated with breast secretion) following discontinuation of therapy.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with risk factors for coronary artery disease; may lead to increased risk of myocardial infarction. May have a dose-related risk of vascular disease and hypertension; women with hypertension should be encouraged to use a nonhormonal form of contraception.

- Depression: Use with caution in patients with depression.

- Diseases exacerbated by fluid retention: Use with caution in patients with diseases which may be exacerbated by fluid retention, including asthma, epilepsy, migraine, diabetes or renal dysfunction.

- Gallbladder disease: May have a dose-related risk of gallbladder disease.

- Hepatic adenomas: Extremely rare adenomas and focal nodular hyperplasia resulting in fatal intra-abdominal hemorrhage have been reported in association with long-term oral contraceptive use. Presentation of an abdominal mass, acute abdominal pain, or intra-abdominal bleeding warrants further evaluation to rule out source.

- Migraine: Use with caution in patients with a history of migraine.

- Renal impairment: Women with renal disease should be encouraged to use a nonhormonal form of contraception.

Special populations:

- Pediatrics: Not for use prior to menarche.

- Smokers: **[U.S. Boxed Warning]: The risk of cardiovascular side effects increases in women who smoke cigarettes, especially those who are >35 years of age; women who use combination hormonal contraceptives should be strongly advised not to smoke.**

- Surgical patients: Whenever possible, should be discontinued at least 4 weeks prior to and for 2 weeks following elective surgery associated with an increased risk of thromboembolism or during periods of prolonged immobilization.

Dosage form specific issues:

- Transdermal patch: The amount of ethinyl estradiol absorbed from the transdermal patch results in higher but more variable exposure than achieved if administered orally. The increased estrogen exposure may increase the risk of adverse events, including venous thromboembolism. The combination hormonal contraceptive patch may have adverse effects similar to those associated with oral contraceptive products. Risk of complications increases with other risk factors such as hypertension, hyperlipidemias, obesity and diabetes. The topical patch may be less effective in patients weighing ≥90 kg (198 lb) and an increased incidence of pregnancy has been reported in this population; consider another form of contraception. Transdermal patch may contain conducting metal (eg, aluminum); remove patch prior to MRI.

Other warnings/precautions:

- HIV infection protection: Combination hormonal contraceptives do not protect against HIV infection or other sexually-transmitted diseases.

- Minimum effective dosage: The minimum dosage combination of estrogen/progestin that will effectively treat the individual patient should be used.

Pregnancy Risk FactorX
Pregnancy ConsiderationsPregnancy should be ruled out prior to treatment and discontinued if pregnancy occurs. In general, the use of combination hormonal contraceptives when inadvertently taken early in pregnancy have not been associated with teratogenic effects. Due to increased risk of thromboembolism postpartum, combination hormonal contraceptives should not be started earlier than 4-6 weeks following delivery. The topical patch may be less effective in patients weighing ≥90 kg (198 lb) and an increased incidence of pregnancy has been reported in this population; consider another form of contraception.
LactationEnters breast milk/not recommended (AAP rates “compatible”)
Breast-Feeding ConsiderationsJaundice and breast enlargement in the nursing infant have been reported following the use of combination hormonal contraceptives. May decrease the quality and quantity of breast milk; a nonhormonal form of contraception is recommended.
Adverse ReactionsThe following reactions have been reported with the contraceptive patch. Adverse reactions associated with oral combination hormonal contraceptive agents are also likely to appear with the topical contraceptive patch (frequency difficult to anticipate). Refer to individual oral contraceptive monographs for additional information.

9% to 22%: Abdominal pain, application site reaction, breast symptoms, headache, menstrual cramps, nausea, upper respiratory infection

The following reactions have been associated with combination hormonal contraceptive use:

Increased risk or evidence of association with use:

Cardiovascular: Arterial thromboembolism, cerebral hemorrhage, cerebral thrombosis, hypertension, mesenteric thrombosis, MI, venous thrombosis (with or without embolism)

Gastrointestinal: Gallbladder disease

Hepatic: Hepatic adenomas, liver tumors (benign)

Local: Thrombophlebitis

Ocular: Retinal thrombosis

Respiratory: Pulmonary embolism

Adverse reactions considered drug related:

Cardiovascular: Edema, varicose vein aggravation

Central nervous system: Depression, migraine, mood changes

Dermatologic: Chloasma, melasma, rash (allergic)

Endocrine & metabolic: Amenorrhea, breakthrough bleeding, breast changes (enlargement, pain, secretion, tenderness), fluid retention, infertility (temporary), lactation decreased (with use immediately postpartum), menstrual flow changes, spotting

Gastrointestinal: Abdominal bloating, abdominal cramps, abdominal pain, appetite changes, nausea, weight changes, vomiting

Genitourinary: Cervical ectropion, cervical secretion, endocervical hyperplasia, fibroid enlargement, vaginal candidiasis, vaginitis

Hematologic: Folate decreased, porphyria exacerbation

Hepatic: Cholestatic jaundice

Neuromuscular & skeletal: Chorea exacerbation

Ocular: Contact lens intolerance, corneal curvature changes (steepening)

Respiratory: Rhinitis

Miscellaneous: Anaphylactic/anaphylactoid reactions (including angioedema, circulatory collapse, respiratory collapse, urticaria), SLE exacerbation

Adverse reactions in which association is not confirmed or denied: Acne, auditory disturbances, Budd-Chiari syndrome, cataracts, cervical smear abnormal, colitis, cystitis-like syndrome, dizziness, dysmenorrhea, erythema multiforme, erythema nodosum, headache, hemolytic uremic syndrome, hemorrhagic eruption, hirsutism, libido changes, nervousness, optic neuritis (with or without partial or complete loss of vision), pancreatitis, premenstrual syndrome, renal function impaired, scalp hair loss

Metabolism/Transport Effects

Ethinyl estradiol: **Substrate** of CYP2C9 (minor), 3A4 (major), 3A5-7 (minor); **Inhibits** CYP1A2 (weak), 2B6 (weak), 2C8 (weak), 2C19 (weak), 3A4 (weak)

Norelgestromin: **Substrate** of CYP3A4 (minor)

Drug Interactions

Acitretin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk X: Avoid combination*

Aminoglutethimide: May increase the metabolism of Progestins. *Risk D: Consider therapy modification*

Aprepitant: May decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Aprepitant: May decrease the serum concentration of Contraceptive (Progestins). *Risk D: Consider therapy modification*

Armodafinil: May decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Barbiturates: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Barbiturates: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Benzodiazepines (metabolized by oxidation): Oral Contraceptive (Estrogens) may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

CarBAMazepine: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

CarBAMazepine: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Colesevelam: May decrease the serum concentration of Ethinyl Estradiol. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Estrogen Derivatives may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Felbamate: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Fosaprepitant: May decrease the serum concentration of Oral Contraceptive (Estrogens). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Fosaprepitant: May decrease the serum concentration of Contraceptive (Progestins). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Griseofulvin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk X: Avoid combination*

Griseofulvin: May increase the metabolism of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Herbs (Estrogenic Properties): May enhance the adverse/toxic effect of Estrogen Derivatives. *Risk C: Monitor therapy*

Herbs (Progestogenic Properties) (eg, Bloodroot, Yucca): May enhance the adverse/toxic effect of Progestins. *Risk C: Monitor therapy*

LamoTRIgine: Oral Contraceptive (Estrogens) may decrease the serum concentration of LamoTRIgine. *Risk D: Consider therapy modification*

Modafinil: May decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Mycophenolate: May decrease the serum concentration of Oral Contraceptive (Estrogens). Average AUC values were unchanged, but there was evidence of substantial patient-to-patient variability in response to this combination. *Risk D: Consider therapy modification*

Nafcillin: May increase the metabolism of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

OXcarbazepine: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Phenytoin: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Phenytoin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Protease Inhibitors: Oral Contraceptive (Estrogens) may diminish the therapeutic effect of Protease Inhibitors. Protease Inhibitors may decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Retinoic Acid Derivatives: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Two forms of contraception are recommended in females of child-bearing potential during retinoic acid derivative therapy. **Exceptions:** Adapalene; Alitretinoin; Tretinoin (Topical). *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Rifamycin Derivatives: May decrease the serum concentration of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Ropinirole: Estrogen Derivatives may increase the serum concentration of Ropinirole. *Risk C: Monitor therapy*

Rufinamide: May decrease the serum concentration of Ethinyl Estradiol. *Risk D: Consider therapy modification*

Selegiline: Oral Contraceptive (Estrogens) may increase the serum concentration of Selegiline. *Risk D: Consider therapy modification*

St Johns Wort: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

St Johns Wort: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Thyroid Products: Estrogen Derivatives may diminish the therapeutic effect of Thyroid Products. *Risk C: Monitor therapy*

Tipranavir: Estrogen Derivatives may enhance the dermatologic adverse effect of Tipranavir. The combination of tipranavir/ritonavir and ethinyl estradiol/norethindrone was associated with a high incidence of skin rash. Tipranavir may decrease the serum concentration of Estrogen Derivatives. *Risk D: Consider therapy modification*

TiZANidine: Oral Contraceptive (Estrogens) may increase the serum concentration of TiZANidine. *Risk C: Monitor therapy*

Topiramate: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Oral Contraceptive (Estrogens) may diminish the anticoagulant effect of Vitamin K Antagonists. In contrast, enhanced anticoagulant effects have also been noted with some products. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Contraceptive (Progestins) may diminish the anticoagulant effect of Vitamin K Antagonists. In contrast, enhanced anticoagulant effects have also been noted with some products. *Risk D: Consider therapy modification*

Voriconazole: May decrease the metabolism of Oral Contraceptive (Estrogens). Oral Contraceptive (Estrogens) may increase the serum concentration of Voriconazole. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: CNS effects of caffeine may be enhanced if combination hormonal contraceptives are used concurrently with caffeine. Grapefruit juice increases ethinyl estradiol concentrations and would be expected to increase progesterone serum levels as well; clinical implications are unclear.

Herb/Nutraceutical: St John's wort may decrease levels. Herbs with estrogenic properties may enhance the adverse/toxic effect of estrogen derivatives; examples include alfalfa, black cohosh, bloodroot, hops, kudzu, licorice, red clover, saw palmetto, soybean, thyme, wild yam, yucca. Herbs with progestogenic properties may enhance the adverse/toxic effect of progestins; examples include bloodroot, chasteberry, damiana, oregano, yucca.

Monitoring ParametersBefore starting therapy, a physical exam with reference to the breasts and pelvis are recommended, including a Papanicolaou smear. Exam may be deferred if appropriate; pregnancy should be ruled out prior to use. Monitor patient closely for loss of vision, sudden onset of proptosis, diplopia, migraine; blood pressure; signs and symptoms of thromboembolic disorders; signs or symptoms of depression; glycemic control in patients with diabetes; lipid profiles in patients being treated for hyperlipidemias. Adequate diagnostic measures, including endometrial sampling, if indicated, should be performed to rule out malignancy in all cases of undiagnosed abnormal vaginal bleeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Note: The formulation available in Canada differs from the U.S. product in both composition and the manufacturing process (although delivery rates appear similar).

Patch, transdermal:

Ortho Evra®: Ethinyl estradiol 0.75 mg and norelgestromin 6 mg [releases ethinyl estradiol 20 mcg and norelgestromin 150 mcg per day] (1s, 3s)

Evra® [CAN]: Ethinyl estradiol 0.6 mg and norelgestromin 6 mg [releases ethinyl estradiol 20 mcg and norelgestromin 150 mcg per day] (1s, 3s) [Not available in U.S.]

Pricing: U.S. (www.drugstore.com)

Patch weekly (Ortho Evra)

150-20 mcg/24 hrs (3): $62.99

Mechanism of ActionCombination hormonal contraceptives inhibit ovulation via a negative feedback mechanism on the hypothalamus, which alters the normal pattern of gonadotropin secretion of a follicle-stimulating hormone (FSH) and luteinizing hormone by the anterior pituitary. The follicular phase FSH and midcycle surge of gonadotropins are inhibited. In addition, combination hormonal contraceptives produce alterations in the genital tract, including changes in the cervical mucus, rendering it unfavorable for sperm penetration even if ovulation occurs. Changes in the endometrium may also occur, producing an unfavorable environment for nidation. Combination hormonal contraceptive drugs may alter the tubal transport of the ova through the fallopian tubes. Progestational agents may also alter sperm fertility.

Pharmacodynamics/Kinetics

Ortho Evra®:

Absorption: Topical: Equivalent when applied to abdomen, buttock, upper outer arm, and upper torso

Ethinyl estradiol and norelgestromin: Rapid; reaches plateau by ~48 hours. Absorption of ethinyl estradiol may be increased with heat exposure due to sauna, whirlpool, or treadmill.

The amount of ethinyl estradiol absorbed is 20 mcg/day and results in greater exposure than produced by oral ethinyl estradiol 20 mcg. In contrast, peak levels of ethinyl estradiol are higher in women taking oral tablets.

Protein binding:

Ethinyl estradiol: Albumin

Norelgestromin and norgestrel: >97%; norelgestromin to albumin and norgestrel to sex-hormone-binding globulin

Metabolism: Topical:

Ethinyl estradiol: First-pass effect avoided; forms metabolites

Norelgestromin: Hepatic to norgestrel and others; first-pass effect avoided

Bioavailability: Ethinyl estradiol: ~60% greater using the topical patch when compared to oral tablets.

Half-life elimination: Topical:

Ethinyl estradiol: 17 hours

Norelgestromin: 28 hours

Excretion: Metabolites of ethinyl estradiol and norelgestromin: Urine and feces

Pharmacotherapy PearlsPatches are available in boxes of 3 patches and also in single-patch cartons, intended for use as a replacement patch in case a patch is lost or destroyed. Approximately 5% of patches need to be replaced; ~2% because they fall off, ~3% because of partial detachment.

Dental Health: Effects on Dental TreatmentWhen prescribing antibiotics, patient must be warned to use additional methods of birth control if on oral contraceptives.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, headache, depression, insomnia, nervousness, irritability, and mood disturbances

Mental Health: Effects on Psychiatric TreatmentMay cause flu-like symptoms, take this into consideration if also concerned about SSRI discontinuation syndrome. Carbamazepine and topiramate may increase the metabolism of estradiol, leading to a decrease in serum concentrations. Estrogens may inhibit the metabolism of some benzodiazepines (alprazolam, chlordiazepoxide, diazepam), TCAs, and selegiline. Estrogens may increase the clearance of lorazepam, oxazepam, and temazepam. The Women's Health Initiative (WHI) Memory Study reported an increased risk of developing dementia in postmenopausal women ≥65 years of age during 4 years of treatment with oral conjugated equine estrogens and medroxyprogesterone acetate relative to placebo (1.8% vs 0.9%). Relative risk was 2.05 (95% CI 1.21-3.48). Therefore, estrogens and progestins should not be used for the prevention of dementia. The WHI also reported an increased risk of stroke (29 vs 21 per 10,000 women-years) compared to women receiving placebo. The increase in risk was observed after the first year and persisted. May cause hypertriglyceridemia; monitor in patients receiving antipsychotics especially clozapine, olanzapine, and quetiapine.

Index Terms Norelgestromin and Ethinyl Estradiol; Ortho-Evra

Pharmacologic CategoryContraceptive; Estrogen and Progestin Combination

Use: Labeled IndicationsPrevention of pregnancy; treatment of acne; moderate-to-severe vasomotor symptoms associated with menopause; prevention of osteoporosis (in women at significant risk only)

Use: Unlabeled/InvestigationalTreatment of hypermenorrhea (menorrhagia); pain associated with endometriosis, dysmenorrhea; dysfunctional uterine bleeding

Dosing: Adults

Adolescents ≥15 years and Adults: Females: Acne: Estrostep® Fe: Oral: Refer to dosing for contraception

Moderate-to-severe vasomotor symptoms associated with menopause: Initial: femhrt® 0.5/2.5: Oral: 1 tablet daily; patient should be re-evaluated at 3- to 6-month intervals to determine if treatment is still necessary; patient should be maintained on lowest effective dose

Prevention of osteoporosis: Initial: femhrt® 0.5/2.5: Oral: 1 tablet daily; patient should be maintained on lowest effective dose

Contraception: Oral:

Schedule 1 (Sunday starter): Dose begins on first Sunday after onset of menstruation; if the menstrual period starts on Sunday, take first tablet that very same day. With a Sunday start, an additional method of contraception should be used until after the first 7 days of consecutive administration.

For 21-tablet package: Dosage is 1 tablet daily for 21 consecutive days, followed by 7 days off of the medication; a new course begins on the 8th day after the last tablet is taken.

For 28-tablet package: Dosage is 1 tablet daily without interruption.

Schedule 2 (Day 1 starter): Dose starts on first day of menstrual cycle taking 1 tablet daily.

For 21-tablet package: Dosage is 1 tablet daily for 21 consecutive days, followed by 7 days off of the medication; a new course begins on the 8th day after the last tablet is taken.

For 28-tablet package: Dosage is 1 tablet daily without interruption.

If all doses have been taken on schedule and one menstrual period is missed, continue dosing cycle. If two consecutive menstrual periods are missed, pregnancy test is required before new dosing cycle is started.

Missed doses **monophasic formulations** (refer to package insert for complete information):

One dose missed: Take as soon as remembered or take 2 tablets next day Two consecutive doses missed in the first 2 weeks: Take 2 tablets as soon as remembered or 2 tablets next 2 days. An additional method of contraception should be used for 7 days after missed dose.

Two consecutive doses missed in week 3 or three consecutive doses missed at any time: An additional method of contraception must be used for 7 days after a missed dose.

Schedule 1 (Sunday starter): Continue dose of 1 tablet daily until Sunday, then discard the rest of the pack, and a new pack should be started that same day.

Schedule 2 (Day 1 starter): Current pack should be discarded, and a new pack should be started that same day.

Missed doses **biphasic/triphasic formulations** (refer to package insert for complete information):

One dose missed: Take as soon as remembered or take 2 tablets next day.

Two consecutive doses missed in week 1 or week 2 of the pack: Take 2 tablets as soon as remembered and 2 tablets the next day. Resume taking 1 tablet daily until the pack is empty. An additional method of contraception should be used for 7 days after a missed dose.

Two consecutive doses missed in week 3 of the pack: An additional method of contraception must be used for 7 days after a missed dose.

Schedule 1 (Sunday Starter): Take 1 tablet every day until Sunday. Discard the remaining pack and start a new pack of pills on the same day.

Schedule 2 (Day 1 starter): Discard the remaining pack and start a new pack the same day.

Three or more consecutive doses missed: An additional method of contraception must be used for 7 days after a missed dose.

Schedule 1 (Sunday Starter): Take 1 tablet every day until Sunday; on Sunday, discard the pack and start a new pack.

Schedule 2 (Day 1 Starter): Discard the remaining pack and begin new pack of tablets starting on the same day.

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricFemales:

Acne: Oral (Estrostep® Fe): For use in females ≥15 years; refer to adult dosing for contraception

Contraception: Oral: Refer to adult dosing; not to be used prior to menarche.

Dosing: Renal ImpairmentSpecific guidelines not available; use with caution and monitor blood pressure closely. Consider other forms of contraception.
Dosing: Hepatic ImpairmentContraindicated in patients with hepatic impairment.
Administration: OralAdminister at the same time each day.
Dietary ConsiderationsShould be taken at same time each day. May be taken with or without food. Ensure adequate calcium and vitamin D intake when used for the prevention of osteoporosis.
StorageStore at controlled room temperature of 25°C (77°F).

Estrostep®: Protect from light.

ContraindicationsHypersensitivity to ethinyl estradiol, norethindrone, norethindrone acetate, or any component of the formulation; history of or current thrombophlebitis or venous thromboembolic disorders (including DVT, PE); active or recent (within 1 year) arterial thromboembolic disease (eg, stroke, MI); cerebral vascular disease, coronary artery disease, uncontrolled hypertension; diabetes mellitus with vascular involvement; severe headache with focal neurological symptoms; known or suspected breast carcinoma, endometrial cancer, estrogen-dependent neoplasms, undiagnosed abnormal genital bleeding; hepatic dysfunction or tumor, cholestatic jaundice of pregnancy, jaundice with prior combination hormonal contraceptive use; major surgery with prolonged immobilization; heavy smoking (≥15 cigarettes/day) in patients >35 years of age; pregnancy
Allergy Considerations

- Estrogen Allergy

Warnings/Precautions

Boxed warnings:

- Cardiovascular disease: See “Disease-related concerns” below.
- Dementia: See “Concerns related to adverse effects” below.
- Risks vs benefits: See “Other warnings/precautions” below.
- Smokers: See “Special populations” below.

Concerns related to adverse effects:

- Breast cancer: Estrogens may increase the risk of breast cancer. The use of combination hormonal contraceptives has been associated with a slight increase in frequency of breast cancer, however studies are not consistent. An increased risk of invasive breast cancer was observed in postmenopausal women using conjugated equine estrogens (CEE) in combination with medroxyprogesterone acetate (MPA); a smaller increase in risk was seen with estrogen therapy alone in observational studies. An increase in abnormal mammograms has also been reported with estrogen and progestin therapy in postmenopausal women. Estrogen use may lead to severe hypercalcemia in postmenopausal patients with breast cancer and bone metastases; discontinue estrogen if hypercalcemia occurs

- Dementia: **[U.S. Boxed Warning]: The risk of dementia may be increased in postmenopausal women;** increased incidence was observed in women ≥65 years of age taking CEE alone or in combination with MPA.

- Endometrial carcinoma: Adequate diagnostic measures, including endometrial sampling (if indicated), should be performed to rule out malignancy in all cases of undiagnosed abnormal vaginal bleeding. Unopposed estrogens may increase the risk of endometrial carcinoma in postmenopausal women with an intact uterus. Risk appears to be associated with long-term use. The use of a progestin should be considered when administering estrogens to postmenopausal women with an intact uterus.

- Lipid effects: Estrogen compounds are generally associated with lipid effects such as increased HDL-cholesterol and decreased LDL-cholesterol. Triglycerides may also be increased; use with caution in patients with familial defects of lipoprotein metabolism.

- Retinal vascular thrombosis: Estrogens may cause retinal vascular thrombosis; discontinue permanently if papilledema or retinal vascular lesions are observed on examination.

Disease-related concerns:

- Cardiovascular disease: **[U.S. Boxed Warning]: Estrogens with or without progestin should not be used to prevent cardiovascular disease.** Use caution with cardiovascular disease or dysfunction. May increase the risks of hypertension, myocardial infarction (MI), stroke, pulmonary emboli (PE), and deep vein thrombosis; incidence of these effects was shown to be significantly increased in postmenopausal women using CEE in combination with MPA. Nonfatal MI, PE, and thrombophlebitis have also been reported in males taking high doses of CEE (eg, for prostate cancer). An increased risk of MI has been noted with use of combination hormonal contraceptives, primarily in women with underlying risk factors; women with hypertension or renal disease should be encouraged to use another form of contraception.

- Cholestatic jaundice: Use femhrt™ with caution with history of cholestatic jaundice associated with past estrogen use or pregnancy. Combination oral contraceptives are contraindicated with a history of cholestatic jaundice of pregnancy or jaundice with prior combination hormonal contraceptive use.

- Diseases exacerbated by fluid retention: Use with caution in patients with diseases which may be exacerbated by fluid retention, including asthma, epilepsy, migraine, diabetes, or renal dysfunction.

- Endometriosis: Estrogens may exacerbate endometriosis. Malignant transformation of residual endometrial implants has been reported posthysterectomy with estrogen only therapy. Consider adding a progestin in women with residual endometriosis posthysterectomy.

- Gallbladder disease: Use with caution in patients with gallbladder disease.

- Hepatic hemangiomas: Use with caution in patients with hepatic hemangiomas.

- Hypocalcemia: Use with caution in patients with severe hypocalcemia.

- Porphyria: Use with caution in patients with porphyria.

- Renal impairment: Women with renal disease should be encouraged to use a nonhormonal form of contraception.

- SLE: Use with caution in patients with SLE.

Special populations:

- Pediatrics: Not for use prior to menarche.

- Smokers: **[U.S. Boxed Warning]: The risk of cardiovascular side effects increases in women who smoke cigarettes, especially heavy smokers (≥15 cigarettes/day) and those who are >35 years of age; women who use combination hormonal contraceptives should be strongly advised not to smoke.**

- Surgical patients: Whenever possible, should be discontinued at least 4 weeks prior to and for 2 weeks following elective surgery associated with an increased risk of thromboembolism or during periods of prolonged immobilization.

Other warnings/precautions:

- Acne use: When used for acne, use only in females ≥15 years, who also desire combination hormonal contraceptive therapy, are unresponsive to topical treatments, and have no contraindications to combination hormonal contraceptive use.

- HIV infection protection: Combination hormonal contraceptives do not protect against HIV infection or other sexually-transmitted diseases.

- Minimum effective dosage: Combination hormonal contraceptives: The minimum dosage combination of estrogen/progestin that will effectively treat the individual patient should be used. New patients should be started on products containing ≤0.035 mg of estrogen per tablet.

- Osteoporosis use: When used solely for the prevention of osteoporosis in women at significant risk, nonestrogen treatment options should be considered.

- Risks vs. benefits: **Postmenopausal women: [U.S. Boxed Warning]: Estrogens with or without progestin should be used for shortest duration possible at the lowest effective dose consistent with treatment goals.** Before prescribing estrogen therapy to postmenopausal women, the risks and benefits must be weighed for each patient. Women should be informed of these risks and benefits, as well as possible effects of progestin when added to estrogen therapy. Estrogens with or without progestin should be used for shortest duration possible consistent with treatment goals. Conduct periodic risk:benefit assessments.

Pregnancy Risk FactorX

Pregnancy ConsiderationsPregnancy should be ruled out prior to treatment and discontinued if pregnancy occurs. In general, the use of combination hormonal contraceptives when inadvertently taken early in pregnancy have not been associated with teratogenic effects. Due to increased risk of thromboembolism postpartum, combination hormonal contraceptives should not be started earlier than 4-6 weeks following delivery. Hormonal contraceptives may be less effective in obese patients. An increase in oral contraceptive failure was noted in women with a BMI >27.3. Similar findings were noted in patients weighing ≥90 kg (198 lb) using the contraceptive patch.

LactationEnters breast milk/not recommended

Breast-Feeding Considerations

Jaundice and breast enlargement in the nursing infant have been reported following the use of combination hormonal contraceptives. May decrease the quality and quantity of breast milk; alternative form of contraception is recommended.

Adverse Reactions

The following reactions have been associated with oral contraceptive use:

Increased risk or evidence of association with use:

Cardiovascular: Arterial thromboembolism, cerebral hemorrhage, cerebral thrombosis, hypertension, mesenteric thrombosis, MI, venous thrombosis (with or without embolism)

Gastrointestinal: Gallbladder disease

Hepatic: Hepatic adenomas, liver tumors (benign)

Local: Thrombophlebitis

Ocular: Retinal thrombosis

Renal: Impaired renal function

Respiratory: Pulmonary embolism

Adverse reactions considered drug related:

Cardiovascular: Edema, varicose vein aggravation

Central nervous system: Depression, migraine, mood changes

Dermatologic: Chloasma, melasma, rash (allergic)

Endocrine & metabolic: Amenorrhea, breakthrough bleeding, breast changes (enlargement, pain, secretion, tenderness), fluid retention, infertility (temporary), lactation decreased (with use immediately postpartum), menstrual flow changes, spotting

Gastrointestinal: Abdominal bloating, abdominal cramps, abdominal pain, appetite changes, nausea, weight changes, vomiting

Genitourinary: Cervical ectropion, cervical secretion, vaginal candidiasis, vaginitis

Hematologic: Folate decreased, porphyria exacerbation

Hepatic: Cholestatic jaundice

Neuromuscular & skeletal: Chorea exacerbation

Ocular: Contact lens intolerance, corneal curvature changes (steepening)

Miscellaneous: Anaphylactic/anaphylactoid reactions (including angioedema, circulatory collapse, respiratory collapse, urticaria), SLE exacerbation

Adverse reactions in which association is not confirmed or denied: Acne, Budd-Chiari syndrome, cataracts, colitis, cystitis-like syndrome, dizziness, dysmenorrhea, erythema multiforme, erythema nodosum, headache, hemolytic uremic syndrome, hemorrhagic eruption, hirsutism, libido changes, nervousness, optic neuritis (with or without partial or complete loss of vision), pancreatitis, premenstrual syndrome, renal function impaired, scalp hair loss

The following have been associated with femhrt® and in general, are similar to placebo. Also refer to adverse reactions observed with oral contraceptives for additional reactions observed with estrogen/progestin therapy:

>10%: Central nervous system: Headache (15% to 18%)

1% to 10%:

Central nervous system: Depression (4% to 6%), nervousness (2% to 5%)

Endocrine & metabolic: Breast pain (8% to 9%)

Gastrointestinal: Abdominal pain (8% to 10%), nausea/vomiting (5% to 7%), diarrhea (4% to 6%), dyspepsia (3% to 5%)

Genitourinary: Urinary tract infection (4% to 6%), vaginitis (5%)

Respiratory: Sinusitis (8% to 9%)

Metabolism/Transport Effects

Ethinyl estradiol: **Substrate** of CYP2C9 (minor), 3A4 (major), 3A5-7 (minor); **Inhibits** CYP1A2 (weak), 2B6 (weak), 2C8 (weak), 2C19 (weak), 3A4 (weak)

Norethindrone: **Substrate** of CYP3A4 (major); Induces CYP2C19 (weak)

Drug Interactions

Acitretin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk X: Avoid combination*

Aminoglutethimide: May increase the metabolism of Progestins. *Risk D: Consider therapy modification*

Aprepitant: May decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Aprepitant: May decrease the serum concentration of Contraceptive (Progestins). *Risk D: Consider therapy modification*

Armodafinil: May decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Barbiturates: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Barbiturates: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Benzodiazepines (metabolized by oxidation): Oral Contraceptive (Estrogens) may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Benzodiazepines (metabolized by oxidation): Oral Contraceptive (Progestins) may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

CarBAMazepine: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

CarBAMazepine: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Colesevelam: May decrease the serum concentration of Ethinyl Estradiol. *Risk D: Consider therapy modification*

Colesevelam: May decrease the serum concentration of Norethindrone. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Estrogen Derivatives may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Darunavir: May decrease the serum concentration of Norethindrone. *Risk D: Consider therapy modification*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Felbamate: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Felbamate: May decrease the serum concentration of Oral Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Fosaprepitant: May decrease the serum concentration of Oral Contraceptive (Estrogens). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Fosaprepitant: May decrease the serum concentration of Contraceptive (Progestins). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Griseofulvin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk X: Avoid combination*

Griseofulvin: May increase the metabolism of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Herbs (Estrogenic Properties): May enhance the adverse/toxic effect of Estrogen Derivatives. *Risk C: Monitor therapy*

Herbs (Progestogenic Properties) (eg, Bloodroot, Yucca): May enhance the adverse/toxic effect of Progestins. *Risk C: Monitor therapy*

LamoTRIgine: Oral Contraceptive (Estrogens) may decrease the serum concentration of LamoTRIgine. *Risk D: Consider therapy modification*

Modafinil: May decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Mycophenolate: May decrease the serum concentration of Oral Contraceptive (Estrogens). Average AUC values were unchanged, but there was evidence of substantial patient-to-patient variability in response to this combination. *Risk D: Consider therapy modification*

Mycophenolate: May decrease the serum concentration of Oral Contraceptive (Progestins). *Risk D: Consider therapy modification*

Nafcillin: May increase the metabolism of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

OXcarbazepine: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

OXcarbazepine: May decrease the serum concentration of Oral Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Phenytoin: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Phenytoin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Protease Inhibitors: Oral Contraceptive (Estrogens) may diminish the therapeutic effect of Protease Inhibitors. Protease Inhibitors may decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Retinoic Acid Derivatives: May diminish the therapeutic effect of Oral Contraceptive (Progestins). Two forms of contraception are recommended in females of child-bearing potential during retinoic acid derivative therapy. **Exceptions:** Adapalene; Alitretinoin; Tretinoin (Topical). *Risk C:*

Monitor therapy

Retinoic Acid Derivatives: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). St Johns Wort: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Thyroid Products: Estrogen Derivatives may diminish the therapeutic effect of Thyroid Products. *Risk C: Monitor therapy*

Tipranavir: Estrogen Derivatives may enhance the dermatologic adverse effect of Tipranavir. The combination of tipranavir/ritonavir and ethinyl estradiol/norethindrone was associated with a high incidence of skin rash. Tipranavir may decrease the serum concentration of Estrogen Derivatives. *Risk D: Consider therapy modification*

TiZANidine: Oral Contraceptive (Estrogens) may increase the serum concentration of TiZANidine. *Risk C: Monitor therapy*

Topiramate: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Oral Contraceptive (Estrogens) may diminish the anticoagulant effect of Vitamin K Antagonists. In contrast, enhanced anticoagulant effects have also been noted with some products. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Contraceptive (Progestins) may diminish the anticoagulant effect of Vitamin K Antagonists. In contrast, enhanced anticoagulant effects have also been noted with some products. *Risk D: Consider therapy modification*

Voriconazole: May decrease the metabolism of Oral Contraceptive (Estrogens). Oral Contraceptive (Estrogens) may increase the serum concentration of Voriconazole. *Risk C: Monitor therapy*

Voriconazole: May decrease the metabolism of Oral Contraceptive (Progestins). Oral Contraceptive (Progestins) may increase the serum concentration of Voriconazole. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Routine use increases estrogen level and risk of breast cancer; avoid ethanol. Ethanol may also increase the risk of osteoporosis.

Food: CNS effects of caffeine may be enhanced if combination hormonal contraceptives are used concurrently with caffeine. Grapefruit juice increases ethinyl estradiol concentrations and would be expected to increase progesterone serum levels as well; clinical implications are unclear. Norethindrone absorption is increased by 27% following administration with food.

Herb/Nutraceutical: St John's wort may decrease levels. Herbs with estrogenic properties may enhance the adverse/toxic effect of estrogen derivatives; examples include alfalfa, black cohosh, bloodroot, hops, kudzu, licorice, red clover, saw palmetto, soybean, thyme, wild yam, yucca. Herbs with progestogenic properties may enhance the adverse/toxic effect of progestins; examples include bloodroot, chasteberry, damiana, oregano, yucca.

Test InteractionsIncreased prothrombin and factors VII, VIII, IX, X; increased platelet aggregability, thyroid-binding globulin, total thyroid hormone (T_4), serum triglycerides/phospholipids; decreased antithrombin III, serum folate concentration; pathologist should be advised of estrogen/progesterone therapy when specimens are submitted

Monitoring ParametersBefore starting therapy, a physical exam with reference to the breasts and pelvis are recommended, including a Papanicolaou smear. Exam may be deferred if appropriate; pregnancy should be ruled out prior to use. Monitor patient closely for loss of vision, sudden onset of proptosis, diplopia, migraine; blood pressure; signs and symptoms of thromboembolic disorders; signs or symptoms of depression; glycemic control in patients with diabetes; lipid profiles in patients being treated for hyperlipidemias; thyroid function in patients on thyroid hormone replacement therapy. Adequate diagnostic measures, including endometrial sampling, if indicated, should be performed to rule out malignancy in all cases of undiagnosed abnormal vaginal bleeding.

Menopausal symptoms: Assess need for therapy at 3- to 6-month intervals

Prevention of osteoporosis: Bone density measurement

Nursing: Physical Assessment/MonitoringSee individual agent for Norethindrone.

Patient EducationSee individual agent for Norethindrone.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

femhrt® 1/5: Ethinyl estradiol 5 mcg and norethindrone acetate 1 mg [white tablets]

femhrt® 0.5/2.5: Ethinyl estradiol 2.5 mcg and norethindrone acetate 0.5 mg [white tablets]

Tablet, monophasic formulations:

Balziva™: Ethinyl estradiol 0.035 mg and norethindrone 0.4 mg (28s) [21 light peach tablets and 7 white inactive tablets]

Brevicon®: Ethinyl estradiol 0.035 mg and norethindrone 0.5 mg (28s) [21 blue tablets and 7 orange inactive tablets]

Junel™ 21 1/20: Ethinyl estradiol 0.02 mg and norethindrone acetate 1 mg (21s) [yellow tablets]

Junel™ 21 1.5/30: Ethinyl estradiol 0.03 mg and norethindrone acetate 1.5 mg (21s) [pink tablets]

Junel™ Fe 1/20: Ethinyl estradiol 0.02 mg and norethindrone acetate 1 mg (28s) [21 yellow tablets] and ferrous fumarate 75 mg [7 brown tablets]

Junel™ Fe 1.5/30: Ethinyl estradiol 0.03 mg and norethindrone acetate 1.5 mg (28s) [21 pink tablets] and ferrous fumarate 75 mg [7 brown tablets]

Loestrin® 21 1/20, Microgestin™ 1/20: Ethinyl estradiol 0.02 mg and norethindrone acetate 1 mg (21s) [white tablets]

Loestrin® 21 1.5/30, Microgestin™ 1.5/30: Ethinyl estradiol 0.03 mg and norethindrone acetate 1.5 mg (21s) [green tablets]

Loestrin® 24 Fe: 1/20: Ethinyl estradiol 0.02 mg and norethindrone acetate 1 mg (28s) [24 white tablets] and ferrous fumarate 75 mg [4 brown tablets]

Loestrin® Fe 1/20, Microgestin™ Fe 1/20: Ethinyl estradiol 0.02 mg and norethindrone acetate 1 mg (28s) [21 white tablets] and ferrous fumarate 75 mg [7 brown tablets]

Loestrin® Fe 1.5/30, Microgestin™ Fe 1.5/30: Ethinyl estradiol 0.03 mg and norethindrone acetate 1.5 mg (28s) [21 green tablets] and ferrous fumarate 75 mg [7 brown tablets]

Modicon® 28: Ethinyl estradiol 0.035 mg and norethindrone 0.5 mg (28s) [21 white tablets and 7 green inactive tablets]

Necon® 0.5/35-28: Ethinyl estradiol 0.035 mg and norethindrone 0.5 mg (28s) [21 light yellow tablets and 7 white inactive tablets]

Necon® 1/35-28: Ethinyl estradiol 0.035 mg and norethindrone 1 mg (28s) [21 dark yellow tablets and 7 white inactive tablets]

Norinyl® 1+35: Ethinyl estradiol 0.035 mg and norethindrone 1 mg (28s) [21 yellow-green tablets and 7 orange inactive tablets]

Nortrel™ 0.5/35 mg:

Ethinyl estradiol 0.035 mg and norethindrone 0.5 mg (21s) [light yellow tablets]

Ethinyl estradiol 0.035 mg and norethindrone 0.5 mg (28s) [21 light yellow tablets and 7 white inactive tablets]

Nortrel™ 1/35 mg:

Ethinyl estradiol 0.035 mg and norethindrone 1 mg (21s) [yellow tablets]

Ethinyl estradiol 0.035 mg and norethindrone 1 mg (28s) [21 yellow tablets and 7 white inactive tablets]

Ortho-Novum® 1/35 28: Ethinyl estradiol 0.035 mg and norethindrone 1 mg (28s) [21 peach tablets and 7 green inactive tablets]

Ovcon® 35 21-day: Ethinyl estradiol 0.035 mg and norethindrone 0.4 mg (21s) [peach tablets]

Ovcon® 35 28-day: Ethinyl estradiol 0.035 mg and norethindrone 0.4 mg (28s) [21 peach tablets and 7 green inactive tablets]

Ovcon® 50: Ethinyl estradiol 0.05 mg and norethindrone 1 mg (28s) [21 yellow tablets and 7 green inactive tablets]

Zenchent™: Ethinyl estradiol 0.035 mg and norethindrone 0.4 mg (28s) [21 light peach tablets and 7 white inactive tablets]

Tablet, chewable, monophasic formulations:

Femcon™ Fe: Ethinyl estradiol 0.035 mg and norethindrone 0.4 mg (28s) [21 white tablets and 7 brown inactive tablets] [spearmint flavor]

Tablet, biphasic formulations:

Necon® 10/11-28:

Day 1-10: Ethinyl estradiol 0.035 mg and norethindrone 0.5 mg [10 light yellow tablets]

Day 11-21: Ethinyl estradiol 0.035 mg and norethindrone 1 mg [11 dark yellow tablets]

Day 22-28: 7 white inactive tablets (28s)

Ortho-Novum® 10/11-28:

Day 1-10: Ethinyl estradiol 0.035 mg and norethindrone 0.5 mg [10 white tablets]

        - Day 11-21: Ethinyl estradiol 0.035 mg and norethindrone 1 mg [11 peach tablets]
        - Day 22-28: 7 green inactive tablets (28s)

Tablet, triphasic formulations:

- Aranelle™:
    - Day 1-7: Ethinyl estradiol 0.035 mg and norethindrone 0.5 mg [7 light yellow tablets]
    - Day 8-16: Ethinyl estradiol 0.035 mg and norethindrone 1 mg [9 white tablets]
    - Day 17-21: Ethinyl estradiol 0.035 mg and norethindrone 0.5 mg [5 light yellow tablets]
    - Day 22-28: 7 peach inactive tablets (28s)
- Estrostep® Fe:
    - Day 1-5: Ethinyl estradiol 0.02 mg and norethindrone acetate 1 mg [5 white triangular tablets]
    - Day 6-12: Ethinyl estradiol 0.03 mg and norethindrone acetate 1 mg [7 white square tablets]
    - Day 13-21: Ethinyl estradiol 0.035 mg and norethindrone acetate 1 mg [9 white round tablets]
    - Day 22-28: Ferrous fumarate 75 mg [7 brown tablets] (28s)
- Leena™:
    - Day 1-7: Ethinyl estradiol 0.035 mg and norethindrone 0.5 mg [7 light blue tablets]
    - Day 8-16: Ethinyl estradiol 0.035 mg and norethindrone 1 mg [9 light yellow-green tablets]
    - Day 17-21: Ethinyl estradiol 0.035 mg and norethindrone 0.5 mg [5 light blue tablets]
    - Day 22-28: 7 orange inactive tablets (28s)
- Necon® 7/7/7, Ortho-Novum® 7/7/7 28:
    - Day 1-7: Ethinyl estradiol 0.035 mg and norethindrone 0.5 mg [7 white tablets]
    - Day 8-14: Ethinyl estradiol 0.035 mg and norethindrone 0.75 mg [7 light peach tablets]
    - Day 15-21: Ethinyl estradiol 0.035 mg and norethindrone 1 mg [7 peach tablets]
    - Day 22-28: 7 green inactive tablets (28s)
- Nortrel™ 7/7/7 28:
    - Day 1-7: Ethinyl estradiol 0.035 mg and norethindrone 0.5 mg [7 light yellow tablets]
    - Day 8-14: Ethinyl estradiol 0.035 mg and norethindrone 0.75 mg [7 blue tablets]
    - Day 15-21: Ethinyl estradiol 0.035 mg and norethindrone 1 mg [7 peach tablets]
    - Day 22-28: 7 white inactive tablets (28s)
- Ortho-Novum® 7/7/7 28:
    - Day 1-7: Ethinyl estradiol 0.035 mg and norethindrone 0.5 mg [7 white tablets]
    - Day 8-14: Ethinyl estradiol 0.035 mg and norethindrone 0.75 mg [7 light peach tablets]
    - Day 15-21: Ethinyl estradiol 0.035 mg and norethindrone 1 mg [7 peach tablets]
    - Day 22-28: 7 green inactive tablets (28s)
- Tilia™ Fe:
    - Day 1-5: Ethinyl estradiol 0.02 mg and norethindrone acetate 1 mg [5 white triangular tablets]
    - Day 6-12: Ethinyl estradiol 0.03 mg and norethindrone acetate 1 mg [7 white square tablets]
    - Day 13-21: Ethinyl estradiol 0.035 mg and norethindrone acetate 1 mg [9 white round tablets]
    - Day 22-28: Ferrous fumarate 75 mg [7 brown tablets] (28s)
- Tri-Norinyl® 28:
    - Day 1-7: Ethinyl estradiol 0.035 mg and norethindrone 0.5 mg [7 blue tablets]
    - Day 8-16: Ethinyl estradiol 0.035 mg and norethindrone 1 mg [9 yellow-green tablets]
    - Day 17-21: Ethinyl estradiol 0.035 mg and norethindrone 0.5 mg [5 blue tablets]

Day 22-28: 7 orange inactive tablets (28s)

Mechanism of ActionCombination oral contraceptives inhibit ovulation via a negative feedback mechanism on the hypothalamus, which alters the normal pattern of gonadotropin secretion of a follicle-stimulating hormone (FSH) and luteinizing hormone by the anterior pituitary. The follicular phase FSH and midcycle surge of gonadotropins are inhibited. In addition, combination hormonal contraceptives produce alterations in the genital tract, including changes in the cervical mucus, rendering it unfavorable for sperm penetration even if ovulation occurs. Changes in the endometrium may also occur, producing an unfavorable environment for nidation. Combination hormonal contraceptive drugs may alter the tubal transport of the ova through the fallopian tubes. Progestational agents may also alter sperm fertility.

In postmenopausal women, exogenous estrogen is used to replace decreased endogenous production. The addition of progestin reduces the incidence of endometrial hyperplasia and risk of endometrial cancer in women with an intact uterus.

Pharmacodynamics/Kinetics

Norethindrone: See individual monograph.

Ethinyl estradiol:

Absorption: Rapid

Bioavailability: 43% to 55%

Distribution: V_d: 2-4 L/kg

Protein binding: >95% to albumin

Metabolism: Hepatic via oxidation and conjugation in GI tract; hydroxylated via CYP3A4 to metabolites; first-pass effect; enterohepatic recirculation; reversibly converted to estrone and estriol

Half-life elimination: 19-24 hours

Excretion: Urine (as estradiol, estrone, and estriol); feces

Pharmacotherapy Pearls Norethindrone acetate 1 mg is equivalent to ethinyl estradiol 2.8 mcg.

The World Health Organization (WHO) has issued revised management recommendations for missed combined oral contraceptive pills. Refer to the following reference for a complete presentation and discussion of the guidelines:

Faculty of Family Planning and Reproductive Health Care Clinical Effectiveness Unit, "Faculty Statement from the CEU on a New Publication: WHO Selected Practice Recommendations for Contraceptive Use Update. Missed Pills: New Recommendations," *J Fam Plann Reprod Health Care*, 2005, 31(2):153-5.

Dental Health: Effects on Dental Treatment When prescribing antibiotics, patient must be warned to use additional methods of birth control if on oral contraceptives.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status May cause dizziness, headache, depression, insomnia, nervousness, irritability, and mood disturbances

Mental Health: Effects on Psychiatric Treatment Barbiturates decrease the effects of oral contraceptives; may increase the toxicity of the benzodiazepines and TCAs. The Women's Health Initiative (WHI) Memory Study reported an increased risk of developing dementia in postmenopausal women ≥65 years of age during 4 years of treatment with oral conjugated equine estrogens and medroxyprogesterone acetate relative to placebo (1.8% vs 0.9%). Relative risk was 2.05 (95% CI 1.21-3.48). Therefore, estrogens and progestins should not be used for the prevention of dementia. The WHI also reported an increased risk of stroke (29 vs 21 per 10,000 women-years) compared to women receiving placebo. The increase in risk was observed after the first year and persisted. May cause hypertriglyceridemia; monitor in patients receiving antipsychotics especially clozapine, olanzapine, and quetiapine.

Cardiovascular Considerations It is important to recognize that hormone-based contraceptives may induce or worsen hypertension. These problems are less severe with low-dose ones. Furthermore, hormone-based contraceptives may precipitate thromboembolic events, particularly in women who smoke. It is important that patients on these contraceptives long-term undergo monitoring of blood pressure and avoid cigarette use.

Index Terms Norethindrone Acetate and Ethinyl Estradiol; Ortho Novum

Medication Safety Issues

Sound-alike/look-alike issues:

Ortho-Cyclen® may be confused with Ortho-Cept®

Pronunciation(ETH in il es tra DYE ole & nor JES ti mate)

U.S. Brand NamesMonoNessa™; Ortho Tri-Cyclen®; Ortho Tri-Cyclen® Lo; Ortho-Cyclen®; Previfem™; Sprintec™; Tri-Previfem™; Tri-Sprintec™; TriNessa™

Canadian Brand NamesCyclen®; Tri-Cyclen® ; Tri-Cyclen® Lo

Pharmacologic CategoryContraceptive; Estrogen and Progestin Combination

Use: Labeled IndicationsPrevention of pregnancy; treatment of acne

Use: Unlabeled/InvestigationalTreatment of hypermenorrhea (menorrhagia); pain associated with endometriosis; dysmenorrhea; dysfunctional uterine bleeding

Dosing: AdultsFemales:

Acne (Ortho Tri-Cyclen®): Oral: Refer to dosing for contraception

Contraception: Oral:

Schedule 1 (Sunday starter): Dose begins on first Sunday after onset of menstruation; if the menstrual period starts on Sunday, take first tablet that very same day. **With a Sunday start, an additional method of contraception should be used until after the first 7 days of consecutive administration.**

For 21-tablet package: Dosage is 1 tablet daily for 21 consecutive days, followed by 7 days off of the medication; a new course begins on the 8th day after the last tablet is taken.

For 28-tablet package: Dosage is 1 tablet daily without interruption.

Schedule 2 (Day 1 starter): Dose starts on first day of menstrual cycle taking 1 tablet daily.

For 21-tablet package: Dosage is 1 tablet daily for 21 consecutive days, followed by 7 days off of the medication; a new course begins on the 8th day after the last tablet is taken.

For 28-tablet package: Dosage is 1 tablet daily without interruption.

If all doses have been taken on schedule and one menstrual period is missed, continue dosing cycle. If two consecutive menstrual periods are missed, pregnancy test is required before new dosing cycle is started.

Missed doses **monophasic formulations** (refer to package insert for complete information):

One dose missed: Take as soon as remembered or take 2 tablets next day

Two consecutive doses missed in the first 2 weeks: Take 2 tablets as soon as remembered or 2 tablets next 2 days. **An additional method of contraception should be used for 7 days after missed dose.**

Two consecutive doses missed in week 3 or three consecutive doses missed at any time: **An additional method of contraception must be used for 7 days after a missed dose:**

Schedule 1 (Sunday starter): Continue dose of 1 tablet daily until Sunday, then discard the rest of the pack, and a new pack should be started that same day.

Schedule 2 (Day 1 starter): Current pack should be discarded, and a new pack should be started that same day.

Missed doses **biphasic/triphasic formulations** (refer to package insert for complete information):

One dose missed: Take as soon as remembered or take 2 tablets next day.

Two consecutive doses missed in week 1 or week 2 of the pack: Take 2 tablets as soon as remembered and 2 tablets the next day. Resume taking 1 tablet daily until the pack is empty. **An additional method of contraception must be used for 7 days after a missed dose.**

Two consecutive doses missed in week 3 of the pack. **An additional method of contraception must be used for 7 days after a missed dose.**

Schedule 1 (Sunday starter): Take 1 tablet every day until Sunday. Discard the remaining pack and start a new pack of pills on the same day.

Schedule 2 (Day 1 starter): Discard the remaining pack and start a new pack the same day.

Three or more consecutive doses missed. **An additional method of contraception must be used for 7 days after a missed dose.**

Schedule 1 (Sunday starter): Take 1 tablet every day until Sunday; on Sunday, discard the pack and start a new pack.

Schedule 2 (Day 1 starter): Discard the remaining pack and begin new pack of tablets starting on the same day.

Dosing: PediatricFemales:

Acne: Oral: Children ≥15 years; refer to adult dosing for contraception

Contraception: Oral: Refer to adult dosing; not to be used prior to menarche.

Dosing: Renal ImpairmentSpecific guidelines not available; use with caution and monitor blood pressure closely. Consider other forms of contraception.

Dosing: Hepatic ImpairmentContraindicated in patients with hepatic impairment.

Administration: OralAdminister at the same time each day.

Dietary ConsiderationsShould be taken at same time each day.

StorageStore at controlled room temperature of 25°C (77°F).

ContraindicationsHypersensitivity to ethinyl estradiol, norgestimate, or any component of the formulation; history of or current thrombophlebitis or venous thromboembolic disorders (including DVT, PE); active or recent (within 1 year) arterial thromboembolic disease (eg, stroke, MI); cerebral vascular disease, coronary artery disease, valvular heart disease with complications, severe hypertension; diabetes with vascular involvement; severe headache with focal neurological symptoms; known or suspected breast carcinoma, endometrial cancer, estrogen-dependent neoplasms, undiagnosed abnormal genital bleeding; hepatic dysfunction or tumor, cholestatic jaundice of pregnancy, jaundice with prior combination hormonal contraceptive use; major surgery with prolonged immobilization; heavy smoking (≥15 cigarettes/day) in patients >35 years of age; pregnancy

Allergy Considerations

- Estrogen Allergy

Warnings/Precautions

Boxed warnings:

- Smokers: See “Special populations” below.

Concerns related to adverse effects:

- Breast cancer: The use of combination hormonal contraceptives has been associated with a slight increase in frequency of breast cancer, however, studies are not consistent.
- Glucose intolerance: Combination hormonal contraceptives may cause glucose intolerance.
- Lipid effects: Combination hormonal contraceptives may effect serum triglyceride and lipoprotein levels. Estrogen compounds are generally associated with lipid effects such as increased HDL-cholesterol and decreased LDL-cholesterol. Triglycerides may also be increased; use with caution in patients with familial defects of lipoprotein metabolism.
- Retinal vascular thrombosis: Estrogens may cause retinal vascular thrombosis (has been reported rarely with combination hormonal contraceptives); discontinue permanently if papilledema or retinal vascular lesions are observed on examination.
- Thromboembolism: May increase the risk of thromboembolism.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with risk factors for coronary artery disease; may lead to increased risk of myocardial infarction. May have a dose-related risk of vascular disease and hypertension; women with hypertension should be encouraged to use a nonhormonal form of contraception.
- Depression: Use with caution in patients with depression.
- Diseases exacerbated by fluid retention: Use with caution in patients with diseases which may be exacerbated by fluid retention, including asthma, epilepsy, migraine, diabetes or renal dysfunction.
- Gallbladder disease: May have a dose-related risk of gallbladder disease.
- Migraine: Use with caution in patients with a history of migraine.
- Renal impairment: Women with renal disease should be encouraged to use a nonhormonal form of contraception.

Special populations:

- Pediatrics: Not for use prior to menarche.
- Smokers: **[U.S. Boxed Warning]: The risk of cardiovascular side effects increases in women who smoke cigarettes, especially those who are >35 years of age; women who use combination hormonal contraceptives should be strongly advised not to smoke.**
- Surgical patients: Whenever possible, should be discontinued at least 4 weeks prior to and for 2 weeks following elective surgery associated with an increased risk of thromboembolism or during periods of prolonged immobilization.

Other warnings/precautions:

- Acne use: For use only in females ≥15 years, who also desire combination hormonal contraceptive therapy, are unresponsive to topical treatments, and have no contraindications to combination hormonal contraceptive use.

- HIV infection protection: Combination hormonal contraceptives do not protect against HIV infection or other sexually-transmitted diseases.

- Minimum effective dosage: The minimum dosage combination of estrogen/progestin that will effectively treat the individual patient should be used. New patients should be started on products containing ≤0.035 mg of estrogen per tablet.

Pregnancy Risk FactorX

Pregnancy ConsiderationsPregnancy should be ruled out prior to treatment and discontinued if pregnancy occurs. In general, the use of combination hormonal contraceptives when inadvertently taken early in pregnancy have not been associated with teratogenic effects. Due to increased risk of thromboembolism postpartum, combination hormonal contraceptives should not be started earlier than 4-6 weeks following delivery. Hormonal contraceptives may be less effective in obese patients. An increase in oral contraceptive failure was noted in women with a BMI >27.3. Similar findings were noted in patients weighing ≥90 kg (198 lb) using the contraceptive patch.

LactationEnters breast milk/not recommended (AAP rates “compatible”)

Breast-Feeding ConsiderationsJaundice and breast enlargement in the nursing infant have been reported following the use of combination hormonal contraceptives. May decrease the quality and quantity of breast milk; a nonhormonal form of contraception is recommended.

Adverse ReactionsThe following reactions have been associated with oral contraceptive use:

Increased risk or evidence of association with use:

Cardiovascular: Arterial thromboembolism, cerebral hemorrhage, cerebral thrombosis, hypertension, mesenteric thrombosis, MI, venous thrombosis (with or without embolism)

Gastrointestinal: Gallbladder disease

Hepatic: Hepatic adenomas, liver tumors (benign)

Local: Thrombophlebitis

Ocular: Retinal thrombosis

Respiratory: Pulmonary embolism

Adverse reactions considered drug related:

Cardiovascular: Edema, varicose vein aggravation

Central nervous system: Depression, migraine, mood changes

Dermatologic: Chloasma, melasma, rash (allergic)

Endocrine & metabolic: Amenorrhea, breakthrough bleeding, breast changes (enlargement, pain, secretion, tenderness), fluid retention, infertility (temporary), lactation decreased (with use immediately postpartum), menstrual flow changes, spotting

Gastrointestinal: Abdominal bloating, abdominal cramps, abdominal pain, appetite changes, nausea, weight changes, vomiting

Genitourinary: Cervical ectropion, cervical secretion, vaginal candidiasis, vaginitis

Hematologic: Folate decreased, porphyria exacerbation

Hepatic: Cholestatic jaundice

Neuromuscular & skeletal: Chorea exacerbation

Ocular: Contact lens intolerance, corneal curvature changes (steepening)

Miscellaneous: Anaphylactic/anaphylactoid reactions (including angioedema, circulatory collapse, respiratory collapse, urticaria), SLE exacerbation

Adverse reactions in which association is not confirmed or denied: Acne, Budd-Chiari syndrome, cataracts, colitis, cystitis-like syndrome, dizziness, dysmenorrhea, erythema multiforme, erythema nodosum, headache, hemolytic uremic syndrome, hemorrhagic eruption, hirsutism, libido changes, nervousness, optic neuritis (with or without partial or complete loss of vision), pancreatitis, premenstrual syndrome, renal function impaired, scalp hair loss

Metabolism/Transport EffectsEthinyl estradiol: **Substrate** of CYP2C9 (minor), 3A4 (major), 3A5-7 (minor); **Inhibits** CYP1A2 (weak), 2B6 (weak), 2C8 (weak), 2C19 (weak), 3A4 (weak)

Drug Interactions

Acitretin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk X: Avoid combination*

Aminoglutethimide: May increase the metabolism of Progestins. *Risk D: Consider therapy modification*

Aprepitant: May decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Aprepitant: May decrease the serum concentration of Contraceptive (Progestins). *Risk D: Consider therapy modification*

Armodafinil: May decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Barbiturates: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Barbiturates: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Benzodiazepines (metabolized by oxidation): Oral Contraceptive (Estrogens) may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Benzodiazepines (metabolized by oxidation): Oral Contraceptive (Progestins) may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

CarBAMazepine: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

CarBAMazepine: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Colesevelam: May decrease the serum concentration of Ethinyl Estradiol. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Estrogen Derivatives may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Felbamate: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Felbamate: May decrease the serum concentration of Oral Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Fosaprepitant: May decrease the serum concentration of Oral Contraceptive (Estrogens). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Fosaprepitant: May decrease the serum concentration of Contraceptive (Progestins). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Griseofulvin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk X: Avoid combination*

Griseofulvin: May increase the metabolism of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Herbs (Estrogenic Properties): May enhance the adverse/toxic effect of Estrogen Derivatives. *Risk C: Monitor therapy*

Herbs (Progestogenic Properties) (eg, Bloodroot, Yucca): May enhance the adverse/toxic effect of Progestins. *Risk C: Monitor therapy*

LamoTRIgine: Oral Contraceptive (Estrogens) may decrease the serum concentration of LamoTRIgine. *Risk D: Consider therapy modification*

Modafinil: May decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Mycophenolate: May decrease the serum concentration of Oral Contraceptive (Estrogens). Average AUC values were unchanged, but there was evidence of substantial patient-to-patient variability in response to this combination. *Risk D: Consider therapy modification*

Mycophenolate: May decrease the serum concentration of Oral Contraceptive (Progestins). *Risk D: Consider therapy modification*

Nafcillin: May increase the metabolism of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

OXcarbazepine: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

OXcarbazepine: May decrease the serum concentration of Oral Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Phenytoin: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Phenytoin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Protease Inhibitors: Oral Contraceptive (Estrogens) may diminish the therapeutic effect of Protease Inhibitors. Protease Inhibitors may decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Retinoic Acid Derivatives: May diminish the therapeutic effect of Oral Contraceptive (Progestins). Two forms of contraception are recommended in females of child-bearing potential during retinoic acid derivative therapy. **Exceptions:** Adapalene; Alitretinoin; Tretinoin (Topical). *Risk C: Monitor therapy*

Retinoic Acid Derivatives: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Two forms of contraception are recommended in females of child-bearing potential during retinoic acid derivative therapy. **Exceptions:** Adapalene; Alitretinoin; Tretinoin (Topical). *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Rifamycin Derivatives: May decrease the serum concentration of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Ropinirole: Estrogen Derivatives may increase the serum concentration of Ropinirole. *Risk C: Monitor therapy*

Rufinamide: May decrease the serum concentration of Ethinyl Estradiol. *Risk D: Consider therapy modification*

Selegiline: Oral Contraceptive (Estrogens) may increase the serum concentration of Selegiline. *Risk D: Consider therapy modification*

Selegiline: Oral Contraceptive (Progestins) may increase the serum concentration of Selegiline. *Risk D: Consider therapy modification*

St Johns Wort: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

St Johns Wort: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Thyroid Products: Estrogen Derivatives may diminish the therapeutic effect of Thyroid Products. *Risk C: Monitor therapy*

Tipranavir: Estrogen Derivatives may enhance the dermatologic adverse effect of Tipranavir. The combination of tipranavir/ritonavir and ethinyl estradiol/norethindrone was associated with a high incidence of skin rash. Tipranavir may decrease the serum concentration of Estrogen Derivatives. *Risk D: Consider therapy modification*

TiZANidine: Oral Contraceptive (Estrogens) may increase the serum concentration of TiZANidine. *Risk C: Monitor therapy*

Topiramate: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Oral Contraceptive (Estrogens) may diminish the anticoagulant effect of Vitamin K Antagonists. In contrast, enhanced anticoagulant effects have also been noted with some products. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Contraceptive (Progestins) may diminish the anticoagulant effect of Vitamin K Antagonists. In contrast, enhanced anticoagulant effects have also been noted with some products. *Risk D: Consider therapy modification*

Voriconazole: May decrease the metabolism of Oral Contraceptive (Estrogens). Oral Contraceptive (Estrogens) may increase the serum concentration of Voriconazole. *Risk C: Monitor therapy*

Voriconazole: May decrease the metabolism of Oral Contraceptive (Progestins). Oral Contraceptive (Progestins) may increase the serum concentration of Voriconazole. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: CNS effects of caffeine may be enhanced if combination hormonal contraceptives are used concurrently with caffeine. Grapefruit juice increases ethinyl estradiol concentrations and would be expected to increase progesterone serum levels as well; clinical implications are unclear.

Herb/Nutraceutical: St John's wort may decrease levels. Herbs with estrogenic properties may enhance the adverse/toxic effect of estrogen derivatives; examples include alfalfa, black cohosh, bloodroot, hops, kudzu, licorice, red clover, saw palmetto, soybean, thyme, wild yam, yucca. Herbs with progestogenic properties may enhance the adverse/toxic effect of progestins; examples include bloodroot, chasteberry, damiana, oregano, yucca.

Monitoring ParametersBefore starting therapy, a physical exam with reference to the breasts and pelvis are recommended, including a Papanicolaou smear. Exam may be deferred if appropriate; pregnancy should be ruled out prior to use. Monitor patient closely for loss of vision, sudden onset of proptosis, diplopia, migraine; blood pressure; signs and symptoms of thromboembolic disorders; signs or symptoms of depression; glycemic control in patients with diabetes; lipid profiles in patients being treated for hyperlipidemias. Adequate diagnostic measures, including endometrial sampling, if indicated, should be performed to rule out malignancy in all cases of undiagnosed abnormal vaginal bleeding.

Nursing: Physical Assessment/MonitoringAssess for adverse reactions and potential drug interactions. Emphasize importance of regular (monthly) blood pressure checks and annual physical assessment, Pap smear, and vision assessment. Teach importance of maintaining prescribed schedule of dosing. **Pregnancy risk factor X:** Do not use if patient is pregnant.

Patient EducationOral contraceptives do not protect against HIV or other sexually-transmitted diseases. Take exactly as directed by prescriber (also see package insert). You are at risk of becoming pregnant if doses are missed. Detailed and complete information on dosing and missed doses can be found in the package insert. Be aware that some medications may reduce the effectiveness of oral contraceptives; an alternate form of contraception may be needed. Check all medicines (prescription and OTC), herbal, and alternative products with prescriber. It is important that you check your blood pressure monthly (on same day each month) and that you have an annual physical assessment, Pap smear, and vision assessment while taking this medication. Avoid smoking while taking this medication; smoking increases risk of adverse effects, including thromboembolic events and heart attacks. You may experience loss of appetite (small frequent meals will help); or constipation (increased exercise, fluids, fruit, fiber, or stool softeners may help). If you have diabetes, use accurate serum glucose testing to identify any changes in glucose tolerance; notify prescriber of significant changes so antidiabetic medication can be adjusted if necessary. Report immediately pain or muscle soreness; warmth, swelling, pain, or redness in calves; shortness of breath; sudden loss of vision; unresolved leg/ foot swelling; change in menstrual pattern (unusual bleeding, amenorrhea, breakthrough spotting); breast tenderness that does not go away; acute abdominal cramping; signs of vaginal infection (drainage, pain, itching); CNS changes (blurred vision, confusion, acute anxiety, or unresolved depression); chest pain; severe headache or vomiting; weakness in arm or leg; severe abdominal pain or tenderness; jaundice; or significant weight gain (>5 lb/week). Notify prescriber of changes in contact lens tolerance. **Pregnancy/breast-feeding precautions:** This medication should not be used during pregnancy. If you suspect you may become pregnant, contact prescriber immediately. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, monophasic formulations:

MonoNessa™, Ortho-Cyclen®: Ethinyl estradiol 0.035 mg and norgestimate 0.25 mg (28s) [21 blue tablets and 7 green inactive tablets]

Previfem™: Ethinyl estradiol 0.035 mg and norgestimate 0.25 mg (28s) [21 blue tablets and 7 teal inactive tablets]

Sprintec™: Ethinyl estradiol 0.035 mg and norgestimate 0.25 mg (28s) [21 blue tablets and 7 white inactive tablets]

Tablet, triphasic formulations:

Ortho Tri-Cyclen®, TriNessa™:

Day 1-7: Ethinyl estradiol 0.035 mg and norgestimate 0.18 mg [7 white tablets]

Day 8-14: Ethinyl estradiol 0.035 mg and norgestimate 0.215 mg [7 light blue tablets]

Day 15-21: Ethinyl estradiol 0.035 mg and norgestimate 0.25 mg [7 blue tablets]

Day 22-28: 7 green inactive tablets (28s)

Tri-Previfem™:

Day 1-7: Ethinyl estradiol 0.035 mg and norgestimate 0.18 mg [7 white tablets]

Day 8-14: Ethinyl estradiol 0.035 mg and norgestimate 0.215 mg [7 light blue tablets]

Day 15-21: Ethinyl estradiol 0.035 mg and norgestimate 0.25 mg [7 blue tablets]

Day 22-28: 7 teal inactive tablets (28s)

Tri-Sprintec™:

Day 1-7: Ethinyl estradiol 0.035 mg and norgestimate 0.18 mg [7 gray tablets]

Day 8-14: Ethinyl estradiol 0.035 mg and norgestimate 0.215 mg [7 light blue tablets]

Day 15-21: Ethinyl estradiol 0.035 mg and norgestimate 0.25 mg [7 blue tablets]

Day 22-28: 7 white inactive tablets (28s)

Ortho Tri-Cyclen® Lo:

Day 1-7: Ethinyl estradiol 0.025 mg and norgestimate 0.18 mg [7 white tablets]

Day 8-14: Ethinyl estradiol 0.025 mg and norgestimate 0.215 mg [7 light blue tablets]

Day 15-21: Ethinyl estradiol 0.025 mg and norgestimate 0.25 mg [7 dark blue tablets]

Day 22-28: 7 green inactive tablets (28s)

Mechanism of ActionCombination hormonal contraceptives inhibit ovulation via a negative feedback mechanism on the hypothalamus, which alters the normal pattern of gonadotropin secretion of a follicle-stimulating hormone (FSH) and luteinizing hormone by the anterior pituitary. The follicular phase FSH and midcycle surge of gonadotropins are inhibited. In addition, combination hormonal contraceptives produce alterations in the genital tract, including changes in the cervical mucus, rendering it unfavorable for sperm penetration even if ovulation occurs. Changes in the endometrium may also occur, producing an unfavorable environment for nidation. Combination hormonal contraceptive drugs may alter the tubal transport of the ova through the fallopian tubes. Progestational agents may also alter sperm fertility.

Pharmacodynamics/Kinetics

Absorption: Ethinyl estradiol (EE) and norgestimate (NGM): Rapid and well absorbed

Protein binding:

EE: >97% to albumin

Norelgestromin (NGMN): >97% to albumin

Norgestrel (NG): >97% to sex hormone-binding globulin (SHBG); SHBG capacity is affected by plasma ethinyl estradiol levels

Metabolism:

EE: Hepatic; forms metabolites

NGM: Hepatic; forms NGMN (major active metabolite) which is further metabolized to NG (active) and other metabolites

Half-life elimination:

EE: 10-16 hours

NGMN: 18-25 hours

NG: 38-45 hours

Time to peak, plasma: EE and NGM: ~2 hours

Excretion:

EE: Urine and feces

NGM: Urine (~47%) and feces (~37%) as metabolites

Pharmacotherapy PearlsThe World Health Organization (WHO) has issued revised management recommendations for missed combined oral contraceptive pills. Refer to the following reference for a complete presentation and discussion of the guidelines:

Faculty of Family Planning and Reproductive Health Care Clinical Effectiveness Unit, "Faculty Statement from the CEU on a New Publication: WHO Selected Practice Recommendations for Contraceptive Use Update. Missed Pills: New Recommendations," *J Fam Plann Reprod Health Care*, 2005, 31(2):153-5.

Dental Health: Effects on Dental TreatmentWhen prescribing antibiotics, patient must be warned to use additional methods of birth control if on oral contraceptives.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, headache, depression, insomnia, nervousness, irritability, and mood disturbances

Mental Health: Effects on Psychiatric TreatmentBarbiturates decrease the effects of oral contraceptives; may increase the toxicity of the benzodiazepines and TCAs. The Women's Health Initiative (WHI) Memory Study reported an increased risk of developing dementia in postmenopausal women ≥65 years of age during 4 years of treatment with oral conjugated equine estrogens and medroxyprogesterone acetate relative to placebo (1.8% vs 0.9%). Relative risk was 2.05 (95% CI 1.21-3.48). Therefore, estrogens and progestins should not be used for the prevention of dementia. The WHI also reported an increased risk of stroke (29 vs 21 per 10,000 women-years) compared to women receiving placebo. The increase in risk was observed after the first year and persisted. May cause hypertriglyceridemia; monitor in patients receiving antipsychotics especially clozapine, olanzapine, and quetiapine.

Cardiovascular ConsiderationsIt is important to recognize that hormone-based contraceptives may induce or worsen hypertension. These problems are less severe with low-dose ones. Furthermore, hormone-based contraceptives may precipitate thromboembolic events, particularly in women who smoke. It is important that patients on these contraceptives long-term undergo monitoring of blood pressure and avoid cigarette use.

Index TermsEthinyl Estradiol and NGM; Norgestimate and Ethinyl Estradiol; Ortho Cyclen; Ortho Tri Cyclen

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(ETH in il es tra DYE ole & nor JES trel)

U.S. Brand NamesCryselle™; Lo/Ovral®; Low-Ogestrel®; Ogestrel®

Canadian Brand NamesOvral®

Pharmacologic CategoryContraceptive; Estrogen and Progestin Combination

Use: Labeled IndicationsPrevention of pregnancy; postcoital contraceptive or “morning after” pill

Use: Unlabeled/InvestigationalTreatment of hypermenorrhea (menorrhagia); pain associated with endometriosis; dysmenorrhea; dysfunctional uterine bleeding

Dosing: Adults

Females: Contraception: Oral:

Schedule 1 (Sunday starter): Dose begins on first Sunday after onset of menstruation; if the menstrual period starts on Sunday, take first tablet that very same day. **With a Sunday start, an additional method of contraception should be used until after the first 7 days of consecutive administration.**

For 21-tablet package: Dosage is 1 tablet daily for 21 consecutive days, followed by 7 days off of the medication; a new course begins on the 8th day after the last tablet is taken.

For 28-tablet package: Dosage is 1 tablet daily without interruption.

Schedule 2 (Day 1 starter): Dose starts on first day of menstrual cycle taking 1 tablet daily.

For 21-tablet package: Dosage is 1 tablet daily for 21 consecutive days, followed by 7 days off of the medication; a new course begins on the 8th day after the last tablet is taken.

For 28-tablet package: Dosage is 1 tablet daily without interruption.

If all doses have been taken on schedule and one menstrual period is missed, continue dosing cycle. If two consecutive menstrual periods are missed, pregnancy test is required before new dosing cycle is started.

Missed doses **monophasic formulations** (refer to package insert for complete information):

One dose missed: Take as soon as remembered or take 2 tablets next day

Two consecutive doses missed in the first 2 weeks: Take 2 tablets as soon as remembered or 2 tablets next 2 days. **An additional method of contraception should be used for 7 days after missed dose.**

Two consecutive doses missed in week 3 or three consecutive doses missed at any time:

Schedule 1 (Sunday starter): Continue to take 1 tablet daily until Sunday, then discard the rest of the pack, and a new pack is started that same day.

Schedule 2 (Day 1 starter): Current pack should be discarded, and a new pack started that same day. **An additional method of contraception should be used for 7 days after missed dose.**

Females: Postcoital contraception: Oral:

Ethinyl estradiol 0.03 mg and norgestrel 0.3 mg formulation: 4 tablets within 72 hours of unprotected intercourse and 4 tablets 12 hours after first dose

Ethinyl estradiol 0.05 mg and norgestrel 0.5 mg formulation: 2 tablets within 72 hours of unprotected intercourse and 2 tablets 12 hours after first dose

Dosing: PediatricFemales: Contraception or postcoital contraception: Oral: See adult dosing; not to be used prior to menarche.

Dosing: Renal ImpairmentSpecific guidelines not available; use with caution and monitor blood pressure closely. Consider other forms of contraception.

Dosing: Hepatic ImpairmentContraindicated in patients with hepatic impairment.

Administration: OralAdminister at the same time each day.

Dietary ConsiderationsShould be taken at same time each day.

StorageStore at controlled room temperature of 25°C (77°F).

ContraindicationsHypersensitivity to ethinyl estradiol, norgestrel, or any component of the formulation; history of or current thrombophlebitis or venous thromboembolic disorders (including DVT, PE); active or recent (within 1 year) arterial thromboembolic disease (eg, stroke, MI); cerebral vascular disease, coronary artery disease, valvular heart disease with complications, severe hypertension; diabetes mellitus with vascular involvement; severe headache with focal neurological symptoms; known or suspected breast carcinoma, endometrial cancer, estrogen-dependent neoplasms, undiagnosed abnormal genital bleeding; hepatic dysfunction or tumor, cholestatic jaundice of pregnancy, jaundice with prior combination hormonal contraceptive use; major surgery with prolonged immobilization; heavy smoking (≥15 cigarettes/day) in patients >35 years of age; pregnancy

Allergy Considerations

- Estrogen Allergy

Warnings/Precautions

Boxed warnings:

- Smokers: See “Special populations” below.

Concerns related to adverse effects:

- Breast cancer: The use of combination hormonal contraceptives has been associated with a slight increase in frequency of breast cancer, however, studies are not consistent.
- Glucose intolerance: Combination hormonal contraceptives may cause glucose intolerance.
- Lipid effects: Combination hormonal contraceptives may effect serum triglyceride and lipoprotein levels. Estrogen compounds are generally associated with lipid effects such as increased HDL-cholesterol and decreased LDL-cholesterol. Triglycerides may also be increased; use with caution in patients with familial defects of lipoprotein metabolism.
- Retinal vascular thrombosis: Estrogens may cause retinal vascular thrombosis (has been reported rarely with combination hormonal contraceptives); discontinue permanently if papilledema or retinal vascular lesions are observed on examination.
- Thromboembolism: May increase the risk of thromboembolism.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with risk factors for coronary artery disease; may lead to increased risk of myocardial infarction. May have a dose-related risk of vascular disease and hypertension; women with hypertension should be encouraged to use a nonhormonal form of contraception.
- Depression: Use with caution in patients with depression.
- Diseases exacerbated by fluid retention: Use with caution in patients with diseases which may be exacerbated by fluid retention, including asthma, epilepsy, migraine, diabetes or renal dysfunction.
- Gallbladder disease: May have a dose-related risk of gallbladder disease.
- Migraine: Use with caution in patients with a history of migraine.
- Renal impairment: Women with renal disease should be encouraged to use a nonhormonal form of contraception.

Special populations:

- Pediatrics: Not for use prior to menarche.
- Smokers: **[U.S. Boxed Warning]: The risk of cardiovascular side effects increases in women who smoke cigarettes, especially those who are >35 years of age; women who use combination hormonal contraceptives should be strongly advised not to smoke.**
- Surgical patients: Whenever possible, should be discontinued at least 4 weeks prior to and for 2 weeks following elective surgery associated with an increased risk of thromboembolism or during periods of prolonged immobilization.

Other warnings/precautions:

- HIV infection protection: Combination hormonal contraceptives do not protect against HIV infection or other sexually-transmitted diseases.
- Minimum effective dosage: The minimum dosage combination of estrogen/progestin that will effectively treat the individual patient should be used. New patients should be started on products containing ≤0.035 mg of estrogen per tablet.

Pregnancy Risk FactorX

Pregnancy ConsiderationsPregnancy should be ruled out prior to treatment and discontinued if pregnancy occurs. In general, the use of combination hormonal contraceptives when inadvertently taken early in pregnancy have not been associated with teratogenic effects. Due to increased risk of thromboembolism postpartum, combination hormonal contraceptives should not be started earlier than 4-6 weeks following delivery. Hormonal contraceptives may be less effective in obese patients. An increase in oral contraceptive failure was noted in women with a BMI >27.3. Similar findings were noted in patients weighing ≥90 kg (198 lb) using the contraceptive patch.

LactationEnters breast milk/not recommended (AAP rates “compatible”)

Breast-Feeding ConsiderationsJaundice and breast enlargement in the nursing infant have been reported following the use of combination hormonal contraceptives. May decrease the quality and quantity of breast milk; a nonhormonal form of contraception is recommended.

Adverse ReactionsFrequency not defined.

Cardiovascular: Arterial thromboembolism, cerebral hemorrhage, cerebral thrombosis, edema, hypertension, mesenteric thrombosis, MI

Central nervous system: Depression, dizziness, headache, migraine, nervousness, premenstrual syndrome, stroke

Dermatologic: Acne, erythema multiforme, erythema nodosum, hirsutism, loss of scalp hair, melasma (may persist), rash (allergic)

Endocrine & metabolic: Amenorrhea, breakthrough bleeding, breast enlargement, breast secretion, breast tenderness, carbohydrate intolerance, lactation decreased (postpartum), glucose tolerance decreased, libido changes, menstrual flow changes, sex hormone-binding globulins (SHBG) increased, spotting, temporary infertility (following discontinuation), thyroid-binding globulin increased, triglycerides increased

Gastrointestinal: Abdominal cramps, appetite changes, bloating, cholestasis, colitis, gallbladder disease, jaundice, nausea, vomiting, weight gain/loss

Genitourinary: Cervical erosion changes, cervical secretion changes, cystitis-like syndrome, vaginal candidiasis, vaginitis

Hematologic: Antithrombin III decreased, folate levels decreased, hemolytic uremic syndrome, norepinephrine induced platelet aggregability increased, porphyria, prothrombin increased; factors VII, VIII, IX, and X increased

Hepatic: Benign liver tumors, Budd-Chiari syndrome, cholestatic jaundice, hepatic adenomas

Local: Thrombophlebitis

Ocular: Cataracts, change in corneal curvature (steepening), contact lens intolerance, optic neuritis, retinal thrombosis

Renal: Impaired renal function

Respiratory: Pulmonary thromboembolism

Miscellaneous: Hemorrhagic eruption

Metabolism/Transport Effects

Ethinyl estradiol: **Substrate** of CYP2C9 (minor), 3A4 (major), 3A5-7 (minor); **Inhibits** CYP1A2 (weak), 2B6 (weak), 2C8 (weak), 2C19 (weak), 3A4 (weak)

Norgestrel: **Substrate** of CYP3A4 (major)

Drug Interactions

Acitretin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk X: Avoid combination*

Aminoglutethimide: May increase the metabolism of Progestins. *Risk D: Consider therapy modification*

Aprepitant: May decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Aprepitant: May decrease the serum concentration of Contraceptive (Progestins). *Risk D: Consider therapy modification*

Armodafinil: May decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Barbiturates: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Barbiturates: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Benzodiazepines (metabolized by oxidation): Oral Contraceptive (Estrogens) may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Benzodiazepines (metabolized by oxidation): Oral Contraceptive (Progestins) may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

CarBAMazepine: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

CarBAMazepine: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*
